## A JOURNAL OF ART, CIVIL ENGINEERING, AND BUILDING

### GENTLEMANLIKE ART.

R. RUSKIN has laid it down, amongst other piquant principles of his, that "the artist ought to be a gentleman," and in these days there is something particularly attractive about the sentiment. But it must be remembered that this proposition, like all others, requires to be proved; and, to begin with,

if it be true that an artist ought to be a gentleman, then it must logically follow that there will be found in the practice of art certain elements which, in the hands of what is called a gentleman, come to be developed, not merely with a success of their own, but with such particular success as to constitute them almost a paramount consideration in criticism. Now, although we have here a question which no doubt admits of a great deal being said on both sides, especially if personal history is to be the test, yet, as we have hinted, it is probable at any rate that the sympathies of the best men at the present moment are quite in accord with Mr. RUSKIN's doctrine, if this can be properly defined.

The doctrine is that, other things being equal, the treatment of any artistic problem by a man of well-cultivated mind and manners, has in it something that commends the result to people generally who are themselves well-educated and well bred. In other words, culture is recognisable by culture, and the artistic work which is produced by a person of culture is therefore, in the eye of the critic—who ought always to be a person of culture—unmistakably superior to the work of one who is not possessed of that advantage. There is absolutely nothing pedantic about this; it is either plain common sense or error.

The simplest illustration of the principle ought, it would at first appear, to be derived from literature. The artistic element in literature is commonly to be identified with the peculiar and almost indescribable grace called *style*—a term which in this connection has a meaning somewhat different in effect from what the same word signifies in relation to productions, more or less finished, in other arts (for, of course, literature is, in this sense, one of the arts). In painting, for instance, or in music, or in architecture, what is called the style of the work is the style of the individual worker; unless when it is that of the work he has seen fit to imitate, which is another matter. But in letters there is a much more general quality, indeed one quite apart from individuality, which is called style in the mere sense that the writer knows how to write well; the writer who does not know how to write well being a writer who is said to have no style, or sometimes a bad style. Now here we certainly may discern the point before us. In almost every case, exceptions only proving the rule, this literary style is the simple result of a little culture, the refinement of the style being in a general way in proportion to the amount of the culture. If so, the question before us is whether in the productions of the painter or the sculptor, the architect or the ornamentalist, there is or is not to be discerned a similar contrast between the work of one who is a

person of well-cultivated mind and manners and the work of another who is not so. If cause and effect are equal quantities, as they are, this difference in cause must produce this difference in effect inevitably, and, in plain language, the art of the gentleman must so far of necessity be different from the art of the non-gentleman.

What, then, is the gentlemanlike element in art? It is a certain refinement, both of conception and of development, which, in art as in everyday conduct, possesses the charms of delicacy, courtesy, kindness, gentleness, subdued power, self-negation, and other forms of graciousness. It may be bold and strong, self-reliant enough and self-confident, courageous, and even defiant of that criticism which is censorious and of the meaner kind; but it will somehow avoid and escape always the charge of what is colloquially called bad taste. When, for example, we see a picture, no matter who painted it, which represents the shambles, we are justified in questioning whether the painter is a man of refined and gentle character; when we come across a school of painters whose *forte* seems to be the representation of naked bloodshed, we cannot but doubt the high humanity of the school at large; when we even are forced to admire the technical skill with which another school may portray the hardships and miseries of life without being able to glorify the presentment by a touch of that fellow-feeling which exalts man above the brute, and even the brute above the grass he browses on, we are still at liberty to lament the absence of the finer qualities of conception which in the same way elevate the more advanced races of mankind above the less. So also, to come to whatever province of fancy the reader may desire, however restricted, the question is one of full force and sound logic, whether the absence of refined feeling in the individual Englishman, be he only a colour decorator or a modeller of porcelain, does not manifest itself in his work, in contrast with the presence of refined feeling in his fellow-artist whose mental characteristics and opportunities of education have happily been of the better order.

Everybody knows what it is to look at the portrait of a gentleman painted by a gentleman; even when, as sometimes happens, it is deficient in certain bold and muscular qualities of portraiture, still the qualities of refinement and elegance will be discoverable, and one might almost say that the most plebeian subject acquires an air of high intellectual handling when really handled in the manner of a highly-cultivated mind. In sculpture the peculiar grace of a refined modeller is perhaps still more notable. In architecture no less, the design of such a subject as a church, in the hands of a well-educated and well-bred man, is quite a different thing from the same work produced by one who has risen from the ranks without rising above them. It is scarcely necessary to go on to say that in such arts as glass painting, metal work, decoration, carving, and so on, when of the higher order, the same distinction, being undeniably true in logic, is distinctly apparent in practice. Indeed, it is one of the most promising incidents in the present progress of artistic work at large in England, that men of good manners and refined thought are everywhere taking the place of precursors who in too many cases used to be inferior in all such respects. That is to say, the English artist is becoming more and more a gentleman, and his work is, we

say *consequently*, becoming better and better. If, indeed, such a result were not to be expected, in this as in many other things, where would be the inducement for self-culture and the study of refined thought?

There are some artists, however, who will be honestly loth to admit anything of this kind. All such refinement, they will tell us, carries with it a certain sacrifice of power. Nothing can be bought in this world without paying a price, and the price to be paid for gentleness of spirit is the sacrifice of vigour. The masculine and the feminine are two different intelligences, and the compromise of masculinity is the acceptance of femininity, and so on. But we need not deny this. Compared with the "noble savage," as he is produced in the Arabian desert, the Far-Western prairie, or the South African plain, the English scholar, or artist, or lawyer, or what not, may be called an effeminate person. Even the University undergraduate who reads is not able, as a rule, we may admit, to compete in athletics with the undergraduate who does not read. But this, we beg to say, is not the point; and to draw from such analogies the conclusion that an artist ought to cultivate Bohemian habits for the sake of freedom, or even brusque manners for the sake of force, is manifestly the way to a *reductio ad absurdum*. The cultivation of the higher intelligence and the more refined graces of human thought may, of course, like all other cultivation, be easily enough carried to excess; but in the maxim which is our text for the occasion, as the author of it would be one of the last men in the world to advocate the pursuit of the gentleman-like in art to the length of sacrificing its vigour, or to admit the necessity for purchasing mental delicacy at the price of a surrender of mental power, so would we equally decline to admit that there need be any price paid for the masculine grace we speak of, except the pains of acquiring it in its proper form. It has long been known that the best of the academical artists of our day have ceased to recognise the rough-and-ready conditions of artistic life which prevailed in England not so very long ago; in the constructive and ornamental arts we are glad to perceive that the same improvement is being carried out in the same spirit; and the conclusion we take leave to arrive at is that, in the whole field of English imaginative work, the national character is advancing on the same line, with the certain result of an increase of merit in every department; and an increase both of the profit and of the pleasure which equally attend upon the practice of genuine art for art's sake.

### A STUDY OF LIONARDO DA VINCI.

By W. WATKISS LLOYD.

THE two large volumes which have just appeared of the literary works of LIONARDO DA VINCI form a valuable contribution to our more intimate knowledge of one of the greatest of artists. It is well known how voluminous, miscellaneous, unarranged, difficult to decipher, and widely dispersed, are his manuscripts. LIONARDO wrote a small, peculiar hand, with uncertain orthography, and moreover he wrote backwards, from right to left. It is tantalising to turn over a manuscript volume by him and come upon one suggestive pen-and-ink sketch after another, of which the key is an illegible note. Dr. J. P. RICHTER, the compiler and editor of these volumes, admits the difficulty which he experienced in his task. The usual process of reversing the reversed, by reading the writing from the reflection in a mirror, was unsatisfactory and fatiguing; and the easier way was to acquire skill in reading from right to left. What is now published is but a selection from thousands of pages that are preserved in public and private collections in Italy, France, England, and other European countries; it has been made, not only with unstinted care and labour, but with much judgment, although in looking back to memoranda taken in a hurried inspection of a volume in the Ambrosian library at Milan, I am inclined to suspect that the copious materials which still remain unedited are of at least equal interest.

What is here given is worthy of warmest welcome, although one must wish that the materials provided had also been made the subject of a critical analysis and report. After all the pains that have been bestowed on compilation and arrangement, the very nature of the notes is confusing. LIONARDO seems to have set them down as they occurred to him, with the intention of some day reducing them to system.

Here and there we come upon systematic arrangement, but only to be succeeded by hints of disconnected detail which had been noted several times before. What we would have set forth would tend to answer the questions,—How much knowledge of science, art, and nature do the notes display? How far is such knowledge in advance or in arrear of the knowledge of DA VINCI's time? What do we gather that may express characteristics of the age and of the man? And, finally, are there any hints and insight for which we may be thankful?

Among the most interesting sets of memoranda are hints and studies for the great picture of *The Last Supper*. The picture itself, ruined and decayed, is now no longer a testimony to the genius of the painter. Yet thanks to copies, engravings, and drawings taken from it while its original glory was not utterly unimpaired, the world can still count the sentiment which it embodied among its most precious inheritances.

The notes we have here before us date in 1494-5, some three or four years before the painting was executed. They apparently comprise his earliest and crudest, and yet the truly germinative thoughts, of the project. We learn a lesson at the outset, that the very earliest notions which rise in the mind when first under the stimulus of a novel project, are likely to have a value that entitles them to careful recognition and record before they flee away. We find some ideas placed on record which were entirely rejected; others lived on and were cherished and developed; others were modified, transferred, recombined, but are still to be recognised as having vindicated their essential importance and pertinence through every change. It has been said that as we cross a mountainous ridge we have opportunities of seeing weather as it is making. There is the same strange interest in watching the dispersed and turbulent workings of the inventive faculty; in being admitted, as it were, into the laboratory of artistic and poetic reactions, and witnessing the transformations of merest dross into priceless ore that transcend any of the transmutations that the most enthusiastic alchemist ever dreamed of. It appears that LIONARDO was originally disposed to adhere to the traditional arrangement, according to which in so many pictures of *The Last Supper*, and not all of them earlier, the traitor JUDAS has a seat by himself on the nearer side of a table long enough to accommodate the rest of the apostles on the opposite side. Reproductions are given of two rough sketches carelessly thrown upon a piece of paper, which bears other small sketches and diagrams which in no way pertain to the same subject. In both these sketches LIONARDO has regard to the text: "He that dippeth his hand with Me in the dish, the same shall betray Me." In one, JUDAS tilts the stool on which he sits in front of the table as he reaches forward to place his hand in the dish; in the other he rises from his stool with a movement that indicates the same purpose. We have also a red chalk drawing, in which trial is made of another motive. JUDAS, still by himself on a stool in front, holds up his hand with the gesture of questioning, with allusion to the text: "Then JUDAS which betrayed Him answered and said, Master, is it I? He said unto him, Thou hast said." In the picture the gesture of questioning is made use of for another apostle. In this drawing the CHRIST already indicates an approach to the conception which was ultimately adopted, in the slightly inclined head and the right arm and open hand extended on the table, without reference to the dish. The beloved disciple on His left has thrown himself forward on the table, and is burying his face and hiding his distress with his interlocked arms. In one of the pen-and-ink sketches, JOHN has drooped down on the table to the front of JESUS, who rests His arm upon him as if with a spontaneous caress of comfort. The management of the figure of JOHN, in regard to his position as described in the gospel, was a problem of constant difficulty to the painters, and some of the solutions presented, however reverent, are doubtless grotesque enough. LIONARDO renounced both the ideas which are here left on record, for another in absolute contrast, which gave a more touching exhibition of grief, and had the further advantage of allowing the principal figure the fullest dignity of isolation.

When we have an opportunity of following the successive changes through which order and harmony are educed out of confusion and contradiction, as the artistic mind extricates itself out of one false scheme after another, and secures at last an expression of its central thought which can be rested in as satisfactory, we seem to understand the suggestion of the theory of PLATO, that our best knowledge is reminiscence, and that

our endeavour to learn is but a struggle to recollect. The processes of LIONARDO may be confirmed by a noteworthy parallel. Several experimental sketches of TITIAN are preserved for his *Peter Martyr*, the great picture which was burnt at Venice, and in the memory of which those of us who have seen it have an advantage which younger men may envy. The sketches show that the master had early decided upon his composition in all respects but one; yet that one was the most important of all. The saint was prostrate on the ground, his murderer standing over him, who pulls his robe roughly aside to make passage for the fatal stroke. The glimpse of the escort in full flight through the wood behind, and the figure of the flying and wounded monk in front, lend pathos to the desertion of the victim. The movement of his lifted arm seems naturally directed to avert the blow. In the picture as completed it is lifted still, but with a substituted motive. It does not grasp, or attempt to grasp, that of the felon; it is extended, as if greeting, towards the palm-bearing cherubs that appear above in an outburst of light from heaven; the revelation of the glorious symbols of martyrdom has possession of his soul even at the crisis of the yet uncompleted sacrifice. And yet the direction of the look of PETER, and the pose of the head that admits of it, which are so essential to the sentiment and might seem to have governed the entire design, were the very latest decisions of the painter. The sketches show the several trials of the head in various positions, which would not have admitted of this effect.

It is probable that few artists have been without the occasional experience of feeling as if possessed with an idea which haunts them and eludes them, which is sometimes half seen, half seized, and then is lost again, until perseverance is justified by ability to fix it in a form which has little enough resemblance to many an intermediate guess, but which yet seems to have been existent though latent all along. The written notes of LIONARDO convey the same impression as his sketches—of an artist who has a general conception in his mind which involves what is most important of all, a sense of the characteristic sentiment, the special pathos which he would realise, and beyond this an instinctive appreciation of the fund of expressive materials at his command. As we read his notes we are reminded of one of those curiosities of draughtsmanship that SHAKESPEARE is fond of referring to under the title of “perspectives”—masses of disarrangement apparently, but which still convey an impression of obscure method and purpose, though this is only brought into correct and self-explained adjustment when the eye is placed at the true point of view. Then what seemed to have the nearest approach to meaning loses it entirely or blends away into another; and what seemed utterly desperate of connection proves a centre of vital expression.

Among the notes we read, thanks to the helpful interpretation of Mr. RICHTER: “One who was drinking and has left the glass in its position, turns his head towards the speaker.” This thought was only written down to be dismissed; it appears no more, either in the sketches or the picture. It is different with the next: “Another, twisting the fingers of his hands together, turns with stern brows to his companion.” We have here an example, which is not without its value, of the toning down in final execution of the rude vigour of an original conception. In the picture JOHN clasps his hands before him, his fingers have flown together and interlaced at the sad and sudden words just spoken; but he is not twisting his fingers, he is not wringing his hands, and so far is he from turning to a companion with stern brows, that he has sunk into himself with deep depression and downcast eyes.

“Another with his hands spread open shows the palms and shrugs his shoulders up towards his ears, making a mouth of astonishment.” Here again has the painter, when he came to stand before the actual wall of the refectory that was to receive his picture, known how “in the very tempest, torrent, and it may be said whirlwind of his passion to acquire and beget a temperance to give it smoothness.” The third apostle to the left in the final composition exhibits the exposed palms; but instead of the shrug of the shoulders we have the hands elevated, and the mouth, however expressive, is not open with astonishment. In the instruction of HAMLET to the players, just quoted, he does not disallow the naturalness of passion breaking wildly forth; in fact, he assumes such fundamental violence as the proper basis of expression. The students of the Dramatic College may have worse advice than to adopt the implied hint of the Danish prince, and to commence the study of a part by

allowing themselves as they recite the speeches to give way with full license of extravagance to whatever movements, gestures, and expressions of countenance the words spontaneously suggest. It is thus that invention is stimulated, thus that it develops instinctively; it will be time enough afterwards, and then the time must be seized, to moderate these outward signs; the nature that is so artfully veiled will still assert itself, even as the limb which the sculptor models as nude contributes to his effect when he has invested it with drapery. Manifestations of passion and pathos are exaggerated even to grotesqueness in the arena of Padua and the pulpit of Pisa; but several of the most overwrought instances are found to be the true precedents in direct line of descent of some of the most subdued and refined embodiments of feeling by the later masters, who knew best the artistic value of self-restraint. The comparison of the notes and sketches of LIONARDO DA VINCI with what we know of his finished work, represents the entire course of such a history of successive epochs of art as proceeding in a single mind.

“Another speaks into his neighbour’s ear, and he, as he listens to him, turns toward him to lend an ear, while he holds a knife in one hand, and in the other the loaf, half cut through by the knife.” This incident was judiciously modified in the picture. That the listener should be suspended, in his action of cutting the bread, by a question from another apostle, would manifestly imply an inconsistent amount of inattention to the startling announcement of JESUS. The recently cut bread is omitted, and the knife is transferred to the speaker—to PETER, in fact—and he, in agreement with the gospel text, is inviting the attention of JOHN, who is too overcome by his own thoughts to immediately attend to him.

“Another who has turned, holding a knife in his hand, upsets with that hand a glass on the table.” There is no second figure holding a knife in the picture, and it is JUDAS who upsets not a glass but a vessel with the salt.

“Another lays his hand on the table, and is looking.” This corresponds with the figure of the apostle on the extreme left of the picture, who stands up at the end of the table, and leans forward as he rests both hands upon it. In the pen-and-ink sketch a figure at the other extremity advances to the table, and places one hand upon it. “Another leans forward to see the speaker (that is, JESUS), and shading his eyes with his hand; another blows his mouth full (*soffia nel boccone*).” Both these suggestions were rejected, and do not reappear either in sketches or picture in the faintest trace. “Another draws back behind the man who leans forward, and sees the speaker between the wall and the man who is leaning.” The motives intimated in this note are curiously resolved and recomposed in the picture. The happy imagination of the contrasted action of leaning back is preserved in the movement of JUDAS, but he is in front instead of behind PETER, who leans forward and looks between him and JOHN in the direction of JESUS.

Finally, in the red chalk drawing we have the gesture which reappears in the picture of an apostle looking in one direction, while he refers to JESUS with a reverted thumb in the other; and in a pair of figures, one slightly leaning back, and one with a single arm extended and expanded palm, which became the beautifully-composed pair of apostles in the group immediately on the left of the SAVIOUR.

## LIABILITY OF AN ARCHITECT FOR TRESPASS.

BY A BARRISTER.

A DECISION was given recently in the Irish Court of Appeal, which illustrates the risks to which an architect may unknowingly expose himself in the ordinary discharge of his professional duties. A contractor employed by a Drainage Board, with the object of carrying out his contract, and by direction of the engineer to the Board, entered upon certain lands, the purchase of which had not been formally completed. The owner sued the engineer for damages for trespass. It was argued that the engineer, being merely employed by the Board to superintend the works, was not liable; but the Court of Appeal have held, reversing the decision of the court below, that the engineer was liable in damages for trespass, on the ground that all persons accessory to the commission of a tort are responsible in damages.

It is curious that the owner should have selected the engineer

as defendant when the contractor and the Board which employed them both were apparently the parties more immediately concerned; but there can be no doubt as to the rule of law with regard to what are termed wrong-doers and their responsibility. Whoever wilfully assists in doing an unlawful act becomes answerable for all the consequences of such act; and when several persons have been jointly concerned in the commission of a wrongful act, they may in general all be charged jointly as principals, or the plaintiff may sue any of the parties upon whom individually a separate trespass attaches. In the case of master and servant, the servant is equally liable with the master in respect of his own personal participation in a wrongful act, and cannot discharge himself from liability on the ground that he acted under unavoidable ignorance, and in obedience to his master's orders; nor can he justify under any authority from his master when his master had no authority in the matter, although the master may himself be made responsible for the act of the servant.

It is often a difficult task to determine the extent of the responsibility of a principal for the negligent or wrongful act of his agent; but, independently of the original authority of the agent to commit the act complained of, the principal may become liable by subsequently ratifying the act of his agent, and thus making it his own act.

"He that receiveth a trespasser, and agrees to a trespass after it is done, is no trespasser," observes Lord COKE, "unless the trespass was done to his use or for his benefit, and then his agreement amounteth to a precedent commandment." But this is a question of too great nicety for present consideration. It will be perhaps useful, nevertheless, to draw attention to cases such as frequently arise where an architect, jointly with his employer or individually, may be made responsible for a wrongful act.

The general rule is that the person injured by the act of another cannot go beyond the person who actually did the injury, unless he can establish that the injury was the inevitable result of some specific order given by the employer. There are two classes of cases. The first, where the act is done under the order of the employer, and the order cannot be obeyed without doing what is complained of. The second, where the improper mode of doing what might be rightly done occasions the mischief. Endeavours have been made to hold all parties liable from whom the act ultimately originates; but it has been held that, if the act ordered to be done can be lawfully done without injury to others, the act of the person personally engaged in doing the mischief is not the act of the person who sets him in motion, unless the relationship of master and servant can be established between them. For example, where the plaintiff and defendant were owners of adjoining ancient houses, and an architect employed by the defendant to superintend the repairs of his house having considered it necessary to pull down and rebuild the front wall, agreed with a contractor to do the work for an estimated price, and the workmen of the contractor, in pulling down the wall, removed a breast-summit which was inserted in the party wall between the defendant's and the plaintiff's house, without taking any precautions, by shoring or otherwise, in consequence of which the front wall of the plaintiff's house fell, it was held that there was no evidence for the jury of any liability on the part of the defendant, the owner of the property. It was not sought in this case to make the architect liable, although if the architect had personally superintended the work he might have been made so. The act here was a lawful act, but was performed in a negligent and improper manner.

Where the act is in itself a nuisance, the party who employs another to do it is responsible for all the consequences; but where the mischief arises not from the act itself, but from the improper mode in which it is done, the person who ordered it is not responsible, unless, as we have already seen, the relations of master and servant exist. In further illustration of this principle, a firm of contractors who were the defendants in the action, entered into a contract to pave certain portions of the parish of St. Pancras. They then entered into a sub-contract with one WARREN to pave a particular street, the materials being supplied by the defendant contractor and brought to the spot in his carts. The stones were so placed on the pathway by the men employed by WARREN as to obstruct the same, and the plaintiff fell over them and was injured. Mr. Justice MAULE held that the sub-contractor and not the person with whom he contracted was liable. "I do not mean to say," he remarked, "that in no case

can a contractor be liable for the negligence of his sub-contractor; but I say that the simple fact of his filling that position does not make him liable. I apprehend that if the defendants had been present and directed or sanctioned the doing of the act complained of, they would have been responsible for it. But here they are sought to be charged simply on the ground that they had contracted with the parish authorities to do the work, in the performance of which by their sub-contractor the negligence happened which has given rise to the plaintiff's misfortune."

In another case where work was done for a railway company under a contract, it was held that the company were not responsible for injury resulting to a third person from the negligent manner of doing the work, though they employed their own surveyor to superintend it and direct *what* shall be done, but not the manner of doing it.

But where the contractor is employed to do an act which is in itself unlawful, in such case the employer is responsible for the wrong so done by the contractor or his servants, and is liable to third persons who sustain damage from the doing of that wrong. "If the contractor does the thing which he is employed to do, the employer is as responsible for that thing as if he did it himself;" as, for example, where a man employs a contractor to build a house, who builds it so as to darken another person's windows, the employer is responsible for the injury.

These illustrations are sufficient to show that an architect may render himself liable in damages for an act which is legally wrongful but for which his employer is actually responsible. In all cases where the architect has reason to anticipate any difficulties of this kind he should, before taking any steps which may involve him in expensive litigation, obtain an indemnity from his employer, and thus protect himself by throwing the burden on the shoulders of those under whose sanction and authority he acts.

## THE ENGINEERING EXHIBITION.

THE Agricultural Hall is once again being utilised as a field for the display of industrial products, and on Thursday an important exhibition, styled the Engineering and Metal Trades Exhibition, was opened to the public, and will remain open till the 21st of this month. The exhibition, as far as can be judged of at present, is likely to prove a success, and fairly representative of the industries the promoters have aimed at illustrating. Leading firms have responded cordially to the invitation of the promoters, and altogether nearly five hundred firms are represented.

We will begin our description of the exhibits with a notice of Messrs. W. H. LINDSAY & Co.'s (Paddington Works) specialities, among which we shall first speak of the patent bridge decking, of which a model is offered for inspection. Several advantages are obtained by the patent trough floor over and above those possessed by other known floors for bridges for railways, roads, &c. Models and sections of the patent are shown. A good article can always be got by paying a price, but in the present days of competition this is not enough; for purchasers, if they lay out their money in proper quarters, may obtain the very best products of manufacture at very low prices. In the patent floor this question of cost has evidently been met. Technically, the improvements claimed for the flooring consist in utilising rolled sections of splayed channel iron, so that the top table shall be thicker than the sides, in order to approach the theory of the girder principle as much as possible, by which means the metal is taken away from the web and added to the flanges, thus increasing the sectional strength of the trough and producing a greater amount of resistance over a floor which is composed of an uniform thickness of plate, without increasing the weight of iron to the square foot of area to be covered. Then the cost of manufacture is reduced to a minimum by rivetting the trade-rolled sections together with a single row of rivets, at such a point in the section where the strain is almost neutral. The floor can therefore be offered at prices by which engineers and contractors can at once satisfy themselves, and frame their estimates according to the current girder rates per ton, so that the floor can be manufactured for 10*l.* 15*s.* per ton, supposing that to be the rate for the manufacture of bridge girder work. The flooring, besides being adapted for supporting railway or road traffic, may also be used for floors of warehouses, where they become fireproof

when the troughs are filled with concrete. Smaller sections make efficient water-tight roofs, as also bankers' and other strong room floors where security for property is required. The strength of the floor is considerable; each trough may be treated as a girder, but each girder is connected to its fellow, so that when weight is applied on one trough it cannot deflect without the assistance of the adjoining troughs for some distance from the point of weight. They have been the subject of careful design and investigation, by which the moment of resistance in inch tons has been determined, so that engineers and contractors will have no difficulty in deciding on the particular trough required, from the sections shown together with the furnished data.

We will next mention the patent wrought-iron sashes with wrought bosses, which have been designed for special adaptation for warehouses, schools, and public buildings. The bosses serve to form a firm joint at the intersection of the bars; they are small, do not obscure the light appreciably, and are not unsightly. The bars and bosses are of malleable wrought-iron, light in appearance, and durable. The sashes can be made at short notice at the price of common cast-iron sashes, as ordinary warehouse and school sashes, or as close bar sashes, (obviating the use of window guards,) gable windows, of circular form and varied pattern, &c. A speciality of a different kind will be found in the Lindsay's improved patent reversible treads and landings, suitable to any sort of staircase, and designed as an improvement on the well-known wooden block construction. Its speciality is that the wooden blocks in each tread can be removed and transposed so many times that it is almost indestructible besides being noiseless. In hospitals, or places where it is desirable to be free from dust, the blocks can be placed close together, so as not to leave any cracks, and so that the treads or landings can be swept or washed clean; also, if it be necessary to get light under a staircase or landing, rough glass blocks can be fitted in the iron frames, side by side with the wood, and a subdued light thus obtained. Each tread is so constructed that the wooden blocks can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn the blocks can be taken from the front, and those next the riser substituted. The worn blocks, after being reversed, are slid into the position next the riser. When the nosing blocks in turn become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all have been utilised. Finally, when in the course of years the wood is worn out, the trays can be re-filled at small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. It has already been adopted by some of the leading architects and engineers with satisfactory results, as has been testified by able professional men. Oak, elm, or teak is generally used in these treads, but, if an exceptionally durable staircase is required, "jarrah," an Australian mahogany of extreme hardness, is employed.

Samples of rolled iron joists are also shown. Some very beautiful specimens of Mediæval ironwork and art metal-work, produced at the works of Messrs. LINDSAY & CO., 14 Wharf Road, Paddington, will be noticed on a future occasion, when a further description of the various exhibits will be given.

### PARIS NOTES.

EACH year the City of Paris appropriates a number of patches or strips of ground required for the widening and straightening of public thoroughfares. From statistics just published it appears that during the first five months of the present year appropriations of this kind were made in eighteen arrondissements. The offers of the municipal authorities for the land thus taken came to 651,615 frs. 90 c., while the jury specially appointed to adjudicate on such cases awarded a total of 776,135 frs. 40 c., or about 20 per cent. more than the offers of the City. The most salient point, however, about the figures is the tremendous and ever-increasing value of land in the centre of Paris, to which they bear witness. Thus in the 2nd Arrondissement the City had to pay from 1,100 frs. to 2,500 frs. per square mètre; in the 8th and 10th Arrondissements from 360 frs. to 650 frs.; in the 15th from 50 frs. to 200 frs.; in the 18th 150 frs. to 370 frs., &c. In the outlying districts the cost was, of course, very much less, ranging from

20 frs. to 70 frs., but the first-named figure of 100l. per square mètre must fully equal, if it does not surpass, the selling value of ground in even the dearest parts of the city of London.

The question of abolishing the existing Paris *enceinte* does not seem to make much progress towards solution, notwithstanding the many committees—parliamentary, municipal, military, technical, and private—that have been appointed to study it. General Thibaudin and the War Office continue steadily to oppose all projects tending to suppress or to impair the military advantages of the Zone, while the expense stands in the way of the execution of the various plans propounded for re-establishing the Zone further out in the country. If this difficulty of cost could be surmounted, it is probable that General de Villenoisy's scheme would stand the best chance of being adopted. It proposes to throw the *enceinte* and space cleared for octroi and defensive purposes as far back as the line of the old forts, and Paris would thus be made to include not only the space lying between the existing wall and the Seine from Billancourt to St.-Ouen, but also Vanves, Montrouge, Gentilly, Charenton, Saint-Mandé, Romainville, and Pantin. This would really be the best possible solution of the matter, for the French capital is certainly somewhat stifled within its existing boundaries.

A rather amusing passage of arms has lately taken place between the Government and the Paris Municipality. With a view to excluding M. Oustry, the Prefect of the Seine, from the new Hôtel de Ville, the Council-General of the Department, which is practically identical with the Municipal Council, requested the administration to negotiate with the State for a lease of the Pavillon de Flore, in order to locate there all the services of the Préfecture, with the exception of those having an exclusively municipal character. As a reply to these overtures, the Government has published a decree in the *Journal Officiel*, whereby all those portions of the Louvre and the Tuileries occupied provisionally since the Commune by the City of Paris' services are to be handed over to the authorities of the National Museum, and prepared for the reception of works of art. The Pavillon de Flore being included in this definition, the design of the Council is entirely frustrated, and M. Oustry will be able, in spite of all opposition, to take possession of the apartments that had been regularly assigned to him in the Hôtel de Ville by former decisions of the Council itself, before the radical element in that body became as paramount as it now is. It may be remarked that the municipal papers and effects are already in process of removal from the Pavillon de Flore to their new quarters, upwards of fifty tons of documents, &c., having been transferred daily during the past week.

The inhabitants of the Quai d'Orsay quarter and many other influential persons have presented a petition to M. Jules Ferry, the Premier and Minister of Fine Arts, with a view to obtain the rebuilding of the Palais de la Cour des Comptes, burnt during the Commune. The question would appear to present many difficulties, for the Administration has already considered several schemes for utilising these ruins, and has been able to arrive at no decision. Plans and estimates for rebuilding the palace and turning it into a great fine arts museum were, in fact, made out some time ago by the Government architects. It was found, however, that, even if the greatest possible use were made of the solid parts left standing, the reconstruction of this vast building and the work of fitting it up as a museum would cost at least 14,000,000 frs. (including the value of the ground), and the Government not being willing to undertake such an expense, the scheme appears to have been definitively abandoned by the official mind. There is nothing, however, to preclude the Société des Arts Décoratifs from applying the proceeds of their gigantic lottery, which is expected to yield upwards of half a million sterling, to carrying out the above-mentioned design, and so turn the ruins into a French South Kensington. Such, indeed, may very possibly be the solution of the problem.

A delegation of the Industrial Art Inquiry Commission, consisting of MM. Teisserenc de Bort, Tolain, Guillaume, Cernesson, Spuller, and Antonin Proust, had an interview on Saturday last with M. Jules Ferry, for the purpose of explaining to him the conclusions that the Commission purposes embodying in its report. This document will recommend the development of instruction in drawing and design, an increase in the number of schools of manual apprenticeship, the founding of industrial art schools at a cost of 5,000,000 frs., and an improved organisation of the body of technical professors.

The Prime Minister expressed himself as prepared to second the recommendations of the Commission, and authorised the

delegation to call a meeting of that body and report his opinions to it.

The Association of French Artists has opened a competition for the design of a new Salon medal to be given to prize winners in future exhibitions, and to mark the new departure taken by the society since its recognition by the State as an institution of public utility. Any member of the association can compete, and must execute a plaster model of the face of the medal, which is not to exceed 10 inches in diameter. Artists are free to choose their own composition, with the one condition that the finished design recalls in some way or other all the arts that are represented in the Salon exhibitions. The models must be sent into the Palais de l'Industrie on or before July 25, and will be exhibited on the 27th, 28th, and 29th of same month. The jury will consist of the members of the sub-committee charged with the administration of the society, presided over by M. Bailly, the president. Three prizes will be awarded of 1,500, 1,000 and 800 frs. respectively, and the lucky artist whose model is chosen for definitive execution will receive the sum of 12,000 frs.

M. Idrac has secured the execution of the bronze statue of Etienne Marcel, to be erected facing the Hôtel de Ville, for which he will receive 40,000 frs., in addition to the cost of the material and casting. Of the other two competitors in the second round, M. Fremiet was classed second with a prize of 5,000 frs., and M. Marqueste third with 4,000 frs. The statue itself is to be 15 feet in height, and M. Idrac has the right of choosing his own artist for the execution of the pedestal.

The following awards were made by the Congress of Architects, whose annual meeting has been lately held in Paris: 1. Private Architecture—Silver medals to Messrs. E. Damville and Léon Lenoir. 2. The French School at Athens—Bronze medals to Messrs. Portier and Remach. 3. National School of Fine Arts—Silver medal to M. Jean Mincou. 4. School of Decorative Art—Silver medal to M. Marcel Rouillard. 5. Private Schools of Architecture—Silver medal to M. Louis Poncet. 6. Municipal School of Apprentices—Silver medal to M. Charles Leroux, and bronze medal to M. F. Descroix.

## MEMORIAL TO LADY MILDRED BERESFORD-HOPE.

A MEMORIAL altar has lately been dedicated in the church of St. Augustine, Canterbury. The altar is in the Under Chapel, and has been erected by Mr. Beresford-Hope as a memorial of his wife, Lady Mildred, and of the seven first archbishops, whose remains lay buried in the abbey, and whose shrines were arranged under the arches of the apse around the high altar; and of St. Ethelbert, Abbot Adrian, St. Mildred, and Queen Bertha, who was never canonised. The chapel is beneath the Guesten Chapel, which is to the south of the Guesten Hall, now used as the college dining-hall. The Under Chapel was long known as the Crypt, and is somewhat similar to that of the Guesten Chapel at Ely, known as Crauden's Chapel, which adjoins the Prior's Hall. It was made a memorial chapel to past students by Warden Bailey, and on its walls are inscribed the names of the deceased students and of the first warden, Bishop Coleridge, of Barbadoes. There are also groups of sculpture designed by Mr. Burges. The new altar is made of oak, and its framing is inlaid with various designs in coloured woods, with the following words over the four panels below: "Exultabunt sancti in gloria laetabuntur in cubilibus suis." The panels have in them figures of St. Mildred, St. Ethelbert, St. Augustine, and Queen Bertha, designed by Clayton, and executed in aluminium repoussé on red and green enamel grounds, diapered with gold, and set in niches of yellow bronze. The mensa is of dark fossil Derbyshire marble and the footpace of Shap granite. The super altar is of dark Derbyshire marble, and on it stand the altar cross, vases, and candlesticks. The design of the first is partly based on a small cross of ancient workmanship in Mr. Beresford-Hope's possession. The new cross is made of bronze and copper gilt, with enamel pictures of the evangelistic symbols at its terminations, and contains a smaller cross of green rock emerald. The cross is supported by a shaft of Derbyshire spar, and by a circular base of bronze. The candlesticks and vases are of corresponding design and material. A memorial cross has also been given by Mr. Beresford-Hope to the altar of the Upper Chapel. It is a tall and slender one of silver with an enamelled *Agnus Dei* in the centre, the terminations being ornamented with cornelians and carbuncles. Its arched base is richly treated, and is of yellow bronze open in the centre, so as to allow the inlaid marble cross of the reredos to be seen through it. The memorials have been designed by Mr. R. Herbert Carpenter, the metal and enamel work

have been carried out by Messrs. Barkinton & Krall, the marble and granite work by Mr. Forsyth, and the oak and inlaid work by Mr. Beresford-Hope's workmen, under Mr. Josephs, at Bedgebury.

## MAGDALENE BRIDGE, OXFORD.

THE annual meeting of the Association of Municipal and Sanitary Engineers was held at Oxford on the 28th ult. and two following days. Mr. W. H. White, C.E., the President of the Association, delivered the opening address, in the course of which he gave a description of several of the local works. The following reference was made to the Magdalene Bridge. The bridge, 164 yards in length, crosses the two branches of the river Cherwell and a meadow between them. It is the only means of communication between the city of Oxford and the eastern suburbs, containing about 9,000 inhabitants, and it also leads to the two main roads to London. The bridge, the erection of which dates 110 years back, is a stone structure of elaborate elevation. It has six semicircular river arches, four semicircular, and one three-centred land arch. The bridge is narrow in proportion to its length, the carriageway being 18 feet and the footways respectively 4 feet 9 inches and 3 feet 9 inches wide. It has of late years been notoriously insufficient for the traffic, and the Local Board has long contemplated widening it. There were also fears of its stability, owing to settlements which had cracked and bulged the masonry, and as far back as 1878 it was thought prudent to stop the cracks with cement concrete, and to put in cramps and tie-rods. The advent of tramways a year or two back caused the Board to decide upon widening the bridge without further delay, and the Tramway Company was "persuaded" to contribute 2,000*l.* towards the work, on account of the further hindrance to traffic which it was seen would be caused by a double line of tramway being worked on the existing 18-feet carriageway. It will, perhaps, be in the recollection of some of the members present what a storm of indignation was aroused by the proposal to interfere with the bridge. Articles appeared in the London papers, meetings were held, and influentially signed petitions sent in, all with one accord protesting against what they were pleased to call "the destruction of an ancient monument," and asserting that the bridge was wide enough for all requirements; but the Board, with pardonable obstinacy, persisted in thinking that those on the spot were the best judges of the necessity of the work. It was accordingly begun in April 1882, and is now well on its way to completion; and I trust it will ultimately be admitted by the objectors that, so far from an act of vandalism having been perpetrated, a work of much public utility has been done without detracting from the picturesque character of the bridge and its surroundings. The extension is on the south-west side, and is 20 feet in width. By this addition the bridge will have a 32 feet 6 inch carriage-way, and two 7 feet footways. The tramway lines will be removed to the centre of the widened road. The elevation of the new part will be a reproduction of the old elevation. The preliminary borings having shown the presence of running sand under nearly the whole of the site, it was determined to pile down to the Oxford clay, which is at a depth of about 18 feet below the surface of the meadow. The bearing piles are of English elm, with cast-iron shoes, secured by strong wrought-iron straps. The piles under the river abutments are 11 inches square and 14 feet long, and under the land abutments and walls 9 inches square and 18 feet long. They were driven by a Lacour's steam pile-driver, and penetrate 2 or 3 feet into the clay. The piles—380 in all—are placed about 4 feet apart from centre to centre, and the weight they sustain averages about 12½ tons per pile, or 400 lbs. per square inch of section. The cost of the piles, including shoes, rings, driving, and cutting off level, was—11 inches, 43*s.* each; 9 inches, 38*s.* 6*d.* Elm sleepers, 6 inches thick, were spiked down to heads of piles. One set of river foundations was completed at one time. Dams were in each case thrown entirely across above and below the bridge, and a temporary cut was made from one branch of the river to the other, to facilitate the passage of the water. Four pier and abutment foundations were thus in hand at once. Each one was surrounded with 9-inch by 3-inch elm sheet piling, 9 feet long, shod, and driven as before described. The cost of the sheet piles, driven and cut off, was 10*s.* 6*d.* each. The ground was excavated one foot below the heads of the bearing piles, and the spaces were filled in with cement concrete, which was carried up to the level of the top of the sleepers, at which height the masonry commenced. The piers and abutments were faced 18 inches thick, and bonded with "through" courses in Stanworth stone (a millstone grit, quarried near Blackburn), set in cement, the filling being of cement concrete. The course from which the arches spring is 2 feet high, and is formed of single stones going through the whole thickness of the piers. The old foundations were discovered to be two thicknesses of 6-inch elm planking, laid a little below the river bed, without any bearing piles. These foundations had settled so irregularly that the piers and abutments were much out of level. As the Thames Valley Drainage Commissioners intend shortly to deepen

the river considerably below the old foundations, it was thought advisable to take this opportunity of securing them. Skewbacks were cut under the old work, and inverted arches of 18-inch brickwork in cement with a versed sine of 3 feet 6 inches, were put in from pier to pier. The river bed between the new piers was also covered with a foot of cement concrete, in order to prevent the heads of the piles being exposed if the river bed should be scoured out at this point after its level has been permanently lowered, and the work was finished by a sheeting of 3-inch elm piles driven across the river above and below the bridge, and tied into the brickwork and concrete. This work was, in the south-east branch of the river, made difficult and risky by the great pressure of water outside the dam, increased by high floods. Springs kept boiling up at all points, and had to be constantly watched and dealt with, as they caused movements of the sand. The work was pushed on night and day, and was finished without mishap, except the slightest possible settlement of one abutment. Under the abutments of the land arches and side walls the foundation is of lias concrete from a foot below to two feet above heads of piles. The ashlar in the side walls and pillars is of oolitic limestone from the Taynton quarries in this county. The land abutments and arch-voussoirs are partly of Taynton and partly of Stanworth stone. The backing of the walls is of a tough limestone from a quarry on the sewage farm in the Coralline Oolite formation, and the abutment backing is of concrete. The whole of this masonry is set in lias mortar. A straight joint is made between the new and old work, and the only ties are wrought-iron "lewis" bolts, "lewised" into the old arch stones and turned down and cemented into the new ones. The parapets are of Taynton stone set in cement, and the several members are secured together vertically by slate "dowels," and horizontally by cement "joggles," no metal ties or cramps being used. The arch spandrels are filled with lias concrete, and a ring of that material is carried round the large arches. It has been found necessary to cut away a large quantity of the old masonry and put in new stone, some of the old arch stones in particular having perished to a dangerous extent. It is intended to pitch the carriage-way with 5-inch setts upon 4½ inches of cement concrete, and the footways will be of 2½ inch York flagging, with 12-inch by 6-inch curb of Stanworth stone. A travelling five-ton steam crane has been constantly at work taking away the excavated soil, depositing the filling, drawing piles, and conveying from point to point all materials and appliances required. The works have, therefore, made rapid progress, with a minimum of hand labour. The contractor is Mr. George Moss, of Liverpool, to whom great credit is due for promptitude and skill. The cost of the work, including the underpinning of the old bridge (paid for by the Thames Valley Drainage Commissioners), but exclusive of land purchases, compensations, and establishment expenses, will be about 10,600*l*.

### WORCESTER ARCHITECTURAL SOCIETY.

THE first excursion of the year by the Worcestershire Architectural and Archaeological Society has been made to the Golden Valley, Herefordshire. The first spot visited was Dorstone Church, which was described by the Rev. Thomas Powell, rector. The present building was repaired and modernised in 1829, and only two relics of the old structure have been preserved in the walls of the present building, which consists simply of nave and chancel. There is an historical interest as to the church that was demolished, as it is recorded that Ricardo de Brito, one of the murderers of Thomas à Becket, sought an asylum here, and built a chapel as an atonement for his crime, which was dedicated by him *ex voto* to St. Faith, A.D. 1271. There are numerous monumental tablets in the church, and one of them records five Thomas Prossers, who were all in succession incumbents of Dorstone over a period of 200 years.

On leaving the church the next object of observation was a pre-historic stone monument or cromlech, called Arthur's Stone, on an eminence about 700 yards above the valley. This Mr. Powell described to have been an altar stone on which the Druids had made sacrifices, and there had been a resident priest, for relics of former fires had been discovered. The long flat stone, or altar, is 19 feet 2 inches long, and its greatest width 11 feet 7 inches. It is of the old red sandstone of the vicinity, and it was supported by many upright props of granite, of which only eight remain upright, the rest being sunk in the soil. There was formerly a further length of flat stone supported by a pillar, but this was broken up fifty years ago to repair the roads. Mr. J. S. Haywood read a paper stating that King Arthur, famed for his round table, had no connection with this ancient stone monument, which was centuries older than his time, and ought to be called Thorstein, as having been dedicated to Thor, the northern heathen god of thunder.

On descending to Dorstone an ancient monolith of granite was noticed standing on a pediment, and now surmounted by a wooden dial, once a cross in Catholic times, and a Celtic relic in heathen days. It is probable that the monolith was really a hoar-stone, so called by the Saxons, of which so many yet remain with corrupted

names in the country, and this by the vulgar consonanting process became Dorstone. The Cistercian monks who came here and founded Abbey Dore punned upon the name, for *or* in heraldry represents gold, so the monks latinised the name to *Vallis aurea*, the golden valley. But to render this appellation understood by the common people, a legend was invented—for every monastery had some wonderment—and it was said that in a certain part of the river Dore a fish had been taken having a golden chain round its body, showing that this was a sacred place, and thus the Golden Valley took its name. Mr. Haywood exhibited an engraving taken from a picture by W. O. Sadler, in which two monks are represented with rod and line capturing this fish environed with the golden miraculous chain.

The interesting church at Peterchurch was visited after the party had dined. The building retains in a great degree the characteristics of the Norman times in which it was built, though touched up by "restoration" in 1869-79. The deep splayed windows all remain, with an apse at the east end, having a small window in the centre. The altar table is formed by a large and long stone, having the usual five crosses upon it. This had been removed from the church in Puritan times, but the present vicar restored it to its former position. A painted sculptured stone is let into the south wall of the nave, representing a fish having a golden chain proceeding from its gills. This sculpture now placed in the wall, is said to have been copied from an older sculpture placed in the church in former times. The original Norman font yet remains, and the tower at the west end of the fabric is surmounted by a spire that is seen from afar. In the churchyard is a grand old yew tree, whose size is remarkable, the bole being 28 feet in girth, and a seat extends all round it.

The churches of Vowchurch and Turnastone were next inspected. To the names a legendary derivation is ascribed, the story being that two maiden sisters determined each to build a church. One of them exclaimed, "I vow my church shall be on this side of the river," upon which the other replied, "I'll build mine on the other side before you can turn-a-stone!" Turnastone, however, has fallen into a state of woe-worn desecration, and, but for its little bell-cot might be taken for a neglected barn. On one side of the altar, on the floor, is a sculptured gravestone representing a knight in plate armour and wife by his side, with the date of 1535.

The Abbey Church, Abbeydore, was last of all visited and described by Rev. A. Phillips, rector. It has a cathedral-like aspect, although divested of its nave, the existing remains being a western transept, chancel, north and south aisles, and porch, with a central tower, the upper embattled part being of later date than the base. The abbey was founded for the White Monks or Cistercians, about the end of the reign of Henry I. King John increased their possessions by a grant of all the land between the Dore and the Trival Brook. In the 31st of Henry VIII., the abbey and lands were granted to John Scudamore, of Holm Lacy, who afterwards purchased the tithes which were originally granted to the Earl of Devonshire. The chapter-house, cloisters, and other buildings belonging to the abbey were pulled down, and the materials sold soon after its suppression, together with part of the church; but enough of the latter is still left to show its form and the beauty of its architecture. During the reign of Charles I., John, Viscount Scudamore, obtained a license to rebuild this fabric, and to endow it with all the tithes of the parish. It was not, however, entirely rebuilt, but underwent considerable repairs, and in 1634 was re-consecrated by the Bishop of St. David's, and opened as the old parish church. The communion plate, silver flagon, chalice, and paten were all bought with a purse of gold given at an offertory by Lord Scudamore, in the reign of Charles II. At the time of the demolition of the abbey, the altar stone having been thrown down had become a salting stone at a farmhouse, and as such it was discovered and replaced where it now stands. It is a single stone 14 feet long, 4 feet wide, and 3 inches thick. There are here several curious monuments, also a remarkable stone coffin, which was found under the church. Beneath an arch in the ambulatory is a mutilated figure, carved in freestone, in chain armour, said to be the effigy of Robert de Ewias, founder of this abbey; another broken and defaced statue in the north aisle, also in chain armour, is said to represent Sir Roger de Clifford, the younger, who was buried here. On the south side of the choir is a very curious massive altar tomb, with coats of arms and Latin inscriptions all round, but difficult to read, to the memory of Sarjeant Hoskynes, who lived in this parish, and was far-famed for his hospitality, and many years kept open house to all who honoured him with a call.

The abbey is of transitional style between Early English and Norman. The aisles and ambulatory are vaulted plainly, but the roof of the chancel is flat and unadorned. Stained glass of older date only remains in the east window of three-lancet lights.

The Wells Charity Estate, Cardiff, consisting of about 13 acres, has been laid out for building purposes, and the governors are now prepared to receive tenders for forming and sewerage some of the streets. Messrs. W. D. Blessley & Aspinall, of Cardiff, are the surveyors.

## NOTES AND COMMENTS.

THE sincerest tribute that could be paid to Mr. GEORGE W. REID is to be found in the regret with which the tidings has been received of his resignation of the post of Keeper of the Department of Prints and Drawings at the British Museum. We wish we could, while expressing our regret, have also offered Mr. REID our congratulations on retiring to enjoy a well-earned repose after forty years of labour devoted to the public interests, but we are sorry to find that failing strength, rather than a desire for rest, has caused Mr. REID to relinquish his post. It is not easy to enumerate the lovers or the followers of art who have not had experience of the kindness and courtesy of Mr. REID, and we are glad to take this opportunity of acknowledging our own indebtedness to him on many occasions, not the least of which were the facilities he afforded us by which we were enabled to reproduce a series of facsimiles of the studies of the great painters of Europe, the first of which, RAPHAEL's study for *The Massacre of the Innocents*, was published in *The Architect*, May 6, 1876. We trust Mr. REID will soon recover health, and long enjoy the rest he has so well earned.

THE collection of works of Indian art selected by Mr. CASPAR PURDON CLARKE for the Science and Art Department was opened to the public on Tuesday. It will be remembered that Mr. CLARKE, on the transfer of the old India Museum to the charge of the Science and Art Department, was sent to India for the purpose of making purchases of Indian art objects, the expenses of the mission, amounting to 8,000*l.*, being borne by the Education Board and the India Office. In recognition of his services to Indian art, Mr. CLARKE has received the Companionship of the Indian Empire.

THE barn at Great Coxwell, in the Vale of the White Horse, was visited lately by the members of the Berkshire Archæological and Architectural Society. It was built by the Abbots of Beaulieu, to whom King JOHN, in 1204, granted the manor. The barn measures 148 feet by 40 feet, the walls being 4 feet in thickness. The farm to which it belongs has been rented by the GERRING family uninterruptedly for the long period of 325 years. After the Restoration the manor of Great Coxwell was granted to the family of MORYS or MORES, who had been lessees under the Abbey. This family held it till the year 1638, when it passed through other hands until it came to the possession of the present owner, the Earl of RADNOR. The great barn was doubtless occupied by MORYS. The mouldings and corbels of the barn show that it belonged to the Decorated period. There are cranes on the gables. The original roof remains. It consists of plain open timber, carried partly on two rows of massive square oak pillars, resting on stone plinths. The barn resembles the interior of a church, with nave and side aisles, transepts or porches. The barn at Cholsey, near Wallingford, which belonged to the Abbot of Reading, was of still greater dimensions, being 51 feet in height, 54 feet in width, and 303 feet in length.

WHERE are the sanitary authorities in the parish of St. Giles, Camberwell? Mr. REDDIN evidently does not believe in their existence, nor would he seem to have much regard for the health or for the lives of his fellow-creatures, if one is to judge by the shocking revelations made before Mr. Justice MATHEW in the case of *CORRIE v. REDDIN*. This enterprising person, having taken a long lease of land on the south side of the Grand Surrey Canal, in St. Giles's parish, Camberwell, proceeded to utilise it to the best advantage to himself by digging out, carting away, and selling all the sand, gravel, and soil which he conveniently could. This was not quite a proper proceeding on the part of Mr. REDDIN, inasmuch as in doing so he was appropriating the freeholder's property; but it was a trifling matter in comparison with Mr. REDDIN's subsequent conduct. His excavations formed a pit of great extent and depth, which he proceeded to fill up with stuff of the foulest character—filth and refuse, collected in the course of his occupation as a scavenger. "To call the pit a dung-heap," said Mr. Justice MATHEW, "would be a flattering phrase." Upon this festered mass Mr. REDDIN intended to build houses. Truly indeed did the learned judge remark that "dwellings built upon such a soil would be mere pest-houses, and that no persons could live in them without injury to their

health, and serious risk to their lives." And yet the sanitary authorities did not interfere! Perhaps they were awaiting further development of the hideous project; perhaps they were blind to its existence altogether. In either case here is a danger to the public health, which, had it not been happily averted by the action of the freeholder, might have caused untold misery and disease. The individual conscience of a man who could deliberately work, or intend to work, such evil for his own miserable aggrandisement is of less consequence than the state of the law, which allows the existence of such a state of things. Public health legislation should be no longer permissive in character; it should be compulsory and penal. The good of the people at large requires protection against corrupt dwellings as much surely as against "corrupt practices" of another kind. Cases of the kind we have referred to are not exceptional. They are of daily occurrence, and the disease and misery that result to innocent persons are incalculable. English people are generally accounted slow and clumsy in matters of this kind, but it is trifling with death to delay longer the necessary legislation.

At the annual general meeting of the Society of Arts, held on Wednesday, June 27, the following resolution was passed: "That this meeting of the Society of Arts desires to express the deep regret with which it has received the news of the death of Mr. WILLIAM SPOTTISWOODE, one of its vice-presidents, and its sense of the loss which the Society has sustained by his decease. In him England loses one of her most remarkable men of science, science itself one of its greatest ornaments, and all who knew him a sincere and valued friend. Besides devoting his own time and thought to the advancement of knowledge, he was ever ready to lend to all engaged in like pursuits the assistance of his experience and his wise counsel. In thus placing on record their own appreciation of his services, the Society desires to express its feelings of sympathy with his widow and his family, and also with the Fellows of the Royal Society, of which he was the honoured and beloved president."

THE loan exhibition of works of old masters, inaugurated at Edinburgh by the Board of Manufactures, was opened publicly on Saturday last. Sir W. FETTES DOUGLAS, P.R.S.A., it may be mentioned, as a member of the hanging committee, took a prominent part in the labours that preceded the opening. The project is considered to be a sort of revival, after the lapse of half a century, of the exhibition of works of old masters held for many years under the auspices of the Royal Institution, so that the exhibition may rather be said to be a resuscitation of an old custom than a new venture. The present exhibition, it is likely, will be but the first of a new series of annual exhibitions devoted to the illustration, if not always of old works, to that of other departments of art. In the list of contributors, which is headed by the QUEEN, are the names of many of the leading nobility and gentry.

A POLICE magistrate who cannot understand the difference between a brick on edge and a breastsummer is scarcely, one would imagine, a competent authority to decide questions relating to defective construction of buildings. When we are told, however, by so-called expert witnesses that 8-feet breastsummers usually deflect a quarter of an inch of their own weight, we are less surprised at a decision which at first view was calculated to astonish the most speculative student of magisterial decisions. The district surveyor of Hammersmith summoned a builder for dangerous construction. An opening in a wall, 8 feet wide, was bridged over by a badly-constructed beam which was not trussed, and, in consequence, had deflected, and seemed to be in a fair way to let down the brickwork above. The magistrate, after hearing the evidence just mentioned, said he could not understand the question, and dismissed the summons. The six houses in Brackenbury Road, Hammersmith, will therefore continue, so long as natural laws of gravitation permit, to enjoy their deflecting beams and fractured brickwork. But it is not a consolatory reflection for the general public that they are so permitted to remain because the learned magistrate "did not understand the question." It is generally a mistake for a judge to give his reasons, and in this case, if the structures should at a future time unmistakably demonstrate their dangerous qualities, the reason given for dismissing the summons will hardly be considered satisfactory.

THE APOTHEOSIS OF HOMER.

THE paintings which adorn the ceilings of the galleries of the Louvre are not as well known to English visitors as the paintings which are hung on the walls. But some of the greatest of modern French artists were commissioned for those ceilings. One of the plafonds is by INGRES, who was the head of the Classical school. He selected the *Apotheosis of Homer* as the subject for one of the plafonds in the gallery of Greek and Roman antiquities. Although the picture is somewhat sculptural in character, the treatment is different from that of the ancient bas-relief of the *Apotheosis* which is in the British Museum. M. INGRES imagines HOMER to be seated before a temple dedicated to himself and standing on Parnassus. He is crowned by Glory. At the foot of the throne are two ideal representatives of the "Iliad" and the "Odyssey," and on both sides are the artists—poets who are supposed to have derived inspiration from the poems. On the right are PINDAR with the lyre, HERODOTUS, PLATO, SOCRATES, PERICLES, PHIDIAS, who offers a sculptor's mallet, ARISTOTLE, who, according to some critics, is supposed to resemble M. INGRES, and ALEXANDER the Great, with the casket which he ordered as a shrine for the "Iliad" and the "Odyssey." Opposite are ÆSCHYLUS, SOPHOCLES, and EURIPIDES; APOLLO is leading RAPHAEL, while VIRGIL conducts DANTE. Below may be seen NICHOLAS POUSSIN, CORNEILLE, and SHAKESPEARE; and on the corresponding level on the right BOILEAU, MOLIÈRE, and RACINE. Behind are LONGINUS, who is writing, FÉNÉLON, the half-blind CERVANTES, and GOETHE. It may be mentioned that a copy of the *Apotheosis* forms a screen behind the statue of the painter which is in Montauban.

INGRES was born at Montauban in 1781, and studied painting under DAVID. He carried off the Grand Prix in painting. In 1824 he received the Cross of the Legion of Honour, and the next year was elected member of the Academy. His pictures were mainly historical, and many of them were glorifications of France. M. INGRES died in 1867, and many eminent artists acknowledged him to be the chief of the French school.

## EDINBURGH ARCHITECTURAL ASSOCIATION.

AT the last meeting of this Association, reports by the hon. secretary, treasurer, &c., were submitted. Mr. David MacGibbon, president, occupied the chair. The report of the Council stated that the session now almost concluded was the most successful in the annals of the Association. With regard to the Architectural Exhibition, the contributions, both as to number and merit, vastly exceeded the most sanguine expectations. Exhibits were received not only from all the great centres of architectural art, but also from many of such private collections as contained the works of deceased or ancient masters. During the session volume iii. of the "Sketch Book" has been issued, and arrangements made for the publication of volume iv. The committee have been encouraged by the success attending the publication of the "Sketch Book" to venture upon improvements in the forthcoming volume, which would very much increase the value of the work. With reference to the membership, the society has great reason to congratulate itself. At the beginning of the financial year the members numbered 139, while now there are 235 on the roll. The names of 11 old members were during the year withdrawn; while 107 gentlemen were proposed, balloted for, and duly admitted. The numerical gain during the session is 96. The Council were happy to be able to announce that several new and important features will be added to the proceedings of the Association during the ensuing session. Besides the ordinary fortnightly papers, a series of lectures on "Early Christian Art" has been promised by Professor Baldwin Brown. There would also be inaugurated two classes for the study of construction and design, which would be worked upon the lines of similar classes carried on by the London Architectural Association and the Royal

Academy. The treasurer's report was also of a satisfactory nature, and showed a balance in hand.

Mr. Rowand Anderson, in moving the adoption of the report, said the Association now occupied a position second to none among Edinburgh societies. Their Architectural Exhibition was one of the events of the season; and while such an exhibition could not be repeated every year, it should not be lost sight of. As to the papers read and lectures given during the past session, he ventured to say that they were as varied and as interesting as those which had occupied the attention of any other society. He was a member of two other societies—the Archæological and the Royal Society. At the Archæological they had a good many papers about kitchen middens and other savoury subjects; while at the Royal Society they got a heavy dose of Professor Tait. At the Architectural Society they had a selection of papers interesting both to professional men and outsiders. The reports were adopted. The following office-bearers were elected for the next session: President, David MacGibbon; vice-presidents, G. Washington Browne and Hippolyte J. Blanc; hon. secretary, T. Fairbairn; and hon. treasurer, R. A. Menzies.

On Saturday last the sessional proceedings of the Association were closed with an excursion to Haddington and neighbourhood. The party, headed by Mr. MacGibbon, president, were met at the Haddington station by Mr. David Croal, author of "Sketches of East Lothian," who conducted them through the town, pointing out the chief places of historical interest, such as the house in which Mrs. Carlyle was brought up, the building in which Edward Irving taught for several years, and Bothwell Castle—still in a remarkable state of preservation, though occupied by people of the poorer class—in which, according to local tradition, Queen Mary spent a night. Crossing the Tyne, the party visited the ruin of St. Martin's Chapel, a building of venerable antiquity. Returning from the Nungate by the bridge of the same name, attention was directed to the public bowling-green, and mention made of the fact that it is the oldest in Scotland, the Council records showing that it was formed more than two hundred years ago, and has been played on every season since. An examination was next made of the "Auld Brig," on the south side of the westmost arch of which was pointed out the iron hook from which criminals were suspended in a bygone age. Having viewed from a distance the oak tree which the late Thomas Carlyle caused to be planted in Giffordgate to mark the spot where stood the house in which John Knox was born, the party entered the churchyard, in which Mr. M'Lachlan read a short paper descriptive of Haddington Church, directing attention to the fact that few of the meritorious specimens of Gothic architecture in Scotland had received so little attention as this edifice. The architecture was, he pointed out, marked by the features of the transition from the early to the later period of the decorated style. The western doorway and the triple arches of the tower window, though exhibiting the semicircular form peculiar to Norman architecture, belonged to a much later period, the former exhibiting a great variety of decoration. Some of the carvings on the building are, Mr. M'Lachlan added, exceedingly curious, and some rather indecent. There are grotesque human faces and animals of various kinds, including the pig, dog, squirrel, fox, and goose; while on a buttress supporting the east gable there is a representation of a man playing upon the bagpipes. Passing through the churchyard, the party examined some of the more notable tombstones, such as those of the Lauderdale family, Mrs. Carlyle, and the Rev. John Brown. Having lunched in the George Hotel, the party drove in waggonettes to Whittinghame and Stonepath Towers, which were explored under the direction of Mr. Ross, after which they walked to Nunraw Castle. Mr. Thomas Bonnar, who some years ago made drawings of an interesting ceiling in the house, gave a sketch of the building, pointing out that probably not less than five centuries had passed since it was erected as an appanage to the nunnery at Haddington, and that in many of its features the house must in its best days have presented an admirable specimen of the style of architecture known as the "Scotch baronial." Mr. Bonnar detailed the circumstances connected with the renovation of the Castle, commenced in 1864, and the discovery of relics of mediæval art on the ceiling of what was supposed to have been the refectory of the nunnery. Mr. Bonnar exhibited a drawing of a somewhat similar ceiling in the Council Hall of Linlithgow of date 1570, the points of resemblance being so close that the opinion was hazarded that both had been designed by the same artist. The party afterwards drove to Yester House, through which, in the absence of the Marquis of Tweeddale, they were conducted by Mr. Swinton, factor on the estate, who described the numerous family and other paintings on the walls, as also many other interesting features of the mansion. Much admiration was excited by the hand-wrought plaster work with which many of the walls and ceilings are ornamented. A visit having next been paid to the old parish church, which is now used as a family burying-ground, a vote of thanks was awarded to Mr. Swinton, after which the party returned to Haddington en route for Edinburgh.

The Sudden Death on Thursday last week of Mr. H. F. Turtle, editor of *Notes and Queries*, will be much regretted by many of our readers.

## ROYAL ARCHÆOLOGICAL INSTITUTE.

THE annual congress of this Institute will commence at Lewes on Tuesday, July 31, when the members will be received by the Mayor and Corporation at an inaugural meeting. The proceedings will be as follows:—

President's Address at the inaugural meeting. Reception of the Sussex Archæological Society at the Castle. Remarks by the Rev. W. B. W. Stephens on the Battle of Lewes. Inspection of the Castle and the Priory, to be followed by general perambulation of the town, and visit to the field of the Battle of Lewes. Mr. Freeman will open the Historical Section at 8 p.m.

Aug. 1.—By rail to Pevensey; Castle and Church. To Rye; Land Gate, Ypress Tower, luncheon. To the Church. To Winchelsea; Church, Town, Gateways, Chapel of Franciscans, &c. By rail to Lewes. Mr. Micklethwaite will open the Architectural Section at 8 p.m.

Aug. 2.—By rail to Hastings; to the Castle. By rail to Battle Abbey. Mr. Freeman will take the party in hand. Luncheon at Battle. By rail to Lewes. Conversation by the Mayor of Lewes in the Assembly Rooms, at 8.30 p.m.

Aug. 3.—Annual Meeting of the Institute. Major-General Pitt Rivers will open the Antiquarian Section at 11 a.m. Excursion by road to Mount Caburn. Major-General Pitt Rivers will take charge of the party. To Glynde Station. By rail to Hailsham; by road to Hurstmonceux, Castle and Church; to Pevensey Station, by rail to Lewes. Sectional Meetings at 8 p.m.

Aug. 4.—By rail to New Shoreham; to the Church. By road, *via* Old Shoreham Church, to Sompting Church; to Broadwater Church; to Worthing, luncheon. To Arundel Castle; Clock Tower, Keep, Church, and Maison Dieu. By rail to Lewes.

Aug. 6.—By rail to Chichester. General concluding meeting in the evening.

## LONGLEAT.

LONGLEAT, the residence of the Marquis of Bath, was visited last week by the Newbury Field Club, when Canon Jackson read a paper describing the building. In the course of it, he said: As to the name of the house, the word *leat* was an old noun, signifying water-course or aqueduct, which occurred in old Acts of Parliament, and was used in Scotland to denote a mill-stream. Probably the stream from Horningsham, now supplying the garden, was originally used for turning a mill. The name first occurred in a Latin document dated 1289, granting certain tithes to the priory of "Langelete." It was sold in 1540 to Sir John Thynne, who in 1546 began building a house, which, however, was burnt in 1566. Next year he commenced afresh, and produced the present house. He employed an architect, whose name, singularly enough, did not appear in any of the accounts for the building. Canon Jackson then described the prevailing domestic architecture of England in that and the preceding periods. When England was torn in pieces by baronial jealousies, the houses of the nobility were nothing else than fortified dungeons, and the fashion of providing for self-defence lingered long after the necessity had ceased. In the reign of Henry VII. these castellated houses were chiefly built with high ornamented gateways, and large projecting windows, of which the front of St. James's Palace, in London, and of Eton College, gave an idea. This style was in the main Gothic—pointed church architecture applied to houses. In Wiltshire specimens of this ecclesiastical tone were found in South Wraxhall House, near Bradford, the property of Mr. Long, in Place House, Tisbury, at Norrington, in the Bishop's Palace at Salisbury, and at Great Chalfield House, near Bradford. The farmer's wife, at an old house, often said, "it was once a nunnery or kind of abbey," the style of building leading, somewhat erroneously, to this idea. Henry VIII. introduced a new style—the ancient architecture of Greece then lately revived in Italy—and upon the expiring ecclesiastical or Gothic style the Corinthian, Ionic, or Tuscan was engrafted. Longleat was one of the purest examples of this novel mixture, and externally was a complete specimen of its period. The balustrades, cupolas, and statues on the top, and the present hall door, were not original, but rather later; otherwise there had been no material change. There were the large mullioned windows of the earlier period of Henry VIII., and of the three storeys the pilasters in the lower were Doric, in the middle Ionic, and in the highest Corinthian. The architecture of the house was Grecian or Italian; yet its general effect was very much that of the old English Ecclesiastical. This style was on the whole adhered to in the reign of Edward VI. and the earlier part of Elizabeth, but declined towards the reign of James I. Tradition said the architect was John of Padua, he and Holbein, the painter, being the two foreigners mostly employed by Henry VIII. in introducing the new style. Canon Jackson then discussed the probability of John of Padua having been the architect, and said he thought one Smithson, the architect of a very similar mansion—Wollaton House, near Nottingham—had something to do with the design. In 1575 Queen Elizabeth visited Sir John Thynne. In 1663 the estate came to a Thomas Thynne, who was shot in 1682 in Pall Mall by the agents of a rival in a love affair, and whose relative Thomas Thynne, after succeeding, was created

Viscount Weymouth. The latter was Bishop Ken's friend and owned the property for thirty-two years. The second lord resided there for a time and kept a hunting establishment but afterwards forsook the place. The third lord, on coming of age in 1754, found the old Dutch gardens fallen into disorder, and called in the celebrated landscape gardener, Brown, who, from his habit of speaking of the great "capability" of grounds, earned the name of "Capability" Brown. Under his directions the Dutch formalities disappeared, and the natural stream, which was deemed insignificant and incommensurate with the grandeur of Longleat—for with the house, gardens, and demesne under the eye Longleat was the very *beau ideal* of an English baronial residence—had to be brought forward in proportion to the other features. At a prodigious expense a plan was carried through by the third Lord Weymouth (created Marquis of Bath in 1789) which produced the idea of a large river flowing through the demesne, widened by serpentine lines into a lake. The Marquis, in 1789, had the honour of receiving as guests at Longleat the King, Queen, and Princesses. The grandfather of the present marquis expended large sums at the beginning of this century on the corridors and large staircase, and the present owner had greatly embellished the interior by newly furnishing sets of rooms long unoccupied.

## EXPLORATIONS IN EGYPT.

A GENERAL meeting of the Egypt Exploration Fund was held on Tuesday afternoon, at the Royal Institution, Albemarle Street, Sir Erasmus Wilson in the chair. The object of the gathering was to hear M. Naville's discourse on his excavations at Pithom-Succoth. Sir Erasmus Wilson opened the business of the meeting. It was reported that by a small outlay, and in six or seven weeks, the society had discovered the remains of the historic city of Pithom, the true route of the Exodus, the second halting-place of the Hebrews, and had placed beyond doubt that the Pharaoh of that time was Rameses II.

The chairman proposed that the monuments should be presented to the British Museum, and this was seconded by Mr. William Fowler, M.P., and passed unanimously. The monuments were accepted by the principal librarian of the British Museum on behalf of the trustees.

M. Naville then proceeded with his narrative, which was one of much interest, and was listened to with deep attention.

A hearty vote of thanks to M. Naville, moved by Mr. W. Fowler, M.P., brought the proceedings to a close.

## RAILWAY BRIDGE OVER THE NIAGARA.

A NEW railway bridge is about to be constructed over Niagara River by the Canada Southern Railway, some 300 feet higher up the river than the present suspension bridge, and the work is to be pushed forward so as to be completed before next winter. It is to be built on the same plan as the new Tay Bridge in Scotland, and known as the cantilever bridge. Each end is to be made up of a section extending from the shore nearly half-way across the chasm, and these sections are to be supported underneath by a strong pillar tower, whilst the shore ends will be so heavily weighted and anchored as to counterbalance the weight on the unsupported end. Between the towers there will be a clear span of 500 feet over the river, the longest double-track truss span in the world. The total length of the bridge will be 895 feet; it will have a double track, and will be built of a strength sufficient to bear two of the heaviest freight trains extending its entire length. From the tower foundations up the whole bridge will be of steel, every inch of which will be subjected to the most rigid tests, and every step taken that can possibly be thought of to insure strength, safety, and durability.

## UNIVERSITY COLLEGE, LONDON.

THE following are the results of the examination of students in the architectural classes, 1883, under Professor T. Roger Smith.

*Fine Art Class.*—Donaldson Silver Medal—H. H. Mew. Prize of books—W. E. Potts. 1st class certificate—E. W. Knight.\* 2nd class certificates—H. Berney, A. T. Bolton, T. Leadbitter, S. H. Seager, R. K. Weymouth. 3rd class certificates—T. D. Atkinson, A. M. Buller, J. A. Minty, A. C. Wood, F. Taylor.

*Construction Class.*—Donaldson Silver Medal—H. Berney. Prize of books—E. L. Conder. 1st class certificates—A. C. Houston,\* A. M. Buller.\* 2nd class certificates—A. S. Flower, T. Leadbitter, S. H. Seager, A. C. Wood. 3rd class certificates—E. Boardman, S. Clarke, J. A. Minty, J. F. O'Connor, W. H. Raffles, R. K. Weymouth.

*Modern Practice Class.*—Prize—T. Leadbitter. 1st class certificates—H. Berney,\* S. H. Seager.\* 2nd class certificates—F. Massie, G. H. Minty. 3rd class certificates—C. H. Aitken, T. D. Atkinson, E. T. Boardman.

\* With marks sufficient to qualify for a prize.

## PRINCESS ALICE HOSPITAL.

THE opening of the Princess Alice Memorial Hospital at Eastbourne took place on Saturday last. Their Royal Highnesses the Prince and Princess of Wales, accompanied by the Princess Elizabeth of Hesse (second daughter of the late Princess Alice), arrived by special train at Eastbourne at one o'clock, and proceeded to the hospital, where their Royal Highnesses were received on alighting by the chairman, the Rev. Canon Whelpton; the treasurer, Mr. George Gurney; and the honorary secretary, Mr. J. H. Campion Coles, who conducted them through the pavilion to the entrance of the hospital, where they were received by the architect, Mr. Thomas W. Cutler, F.R.I.B.A., and Dr. Gream. The Prince of Wales opened the entrance-door with a ceremonial key, which was designed by the architect, and manufactured by Messrs. Chubb & Son. The key was of chiselled and polished steel, inlaid with gold. The handle was in form of a Tudor rose, with the letter A, for Alice, inlaid in gold in centre, the whole surmounted by a princess's coronet. Up the stem was entwined a gold snake. An inspection of the administrative building and wards was then made under the guidance of the architect. Their Royal Highnesses then returned to the pavilion, where, after a short service, the Prince of Wales declared the hospital open.

## DEVIZES CASTLE.

THE Devizes Castle Estate is, we understand, for sale. This important residential property is exceptionally rich in historical associations, having been built in the reign of King Henry I., and occupied by his daughter, the Empress Matilda. Since that time it has formed part of the dowry of twelve of the queens of England, and had until a comparatively very recent date all the immunities of a royal castle. It is situated at an elevation of 400 feet above the sea level, and holds a position in respect to the town of Devizes similar to that of Windsor Castle to the royal borough. The original structure, of which some portions still remain, was built by Roger, Bishop of Salisbury, in the reign of Henry I. A writer, describing the building, says:—

The bishop's four principal castles were those of Old Sarum, Sherbourn, Malmesbury, and Devizes. His culminating ideas of military architecture were realised and displayed in the towers of Devizes. In the construction of this vast edifice, which the monkish historians with unanimous voice declare to have been the most formidable in England, he gave full scope to his aspiring tastes, and lavished upon it, says Malmesbury, "great and almost incalculable sums." The bishop's own expression was that "he built the castle of Devizes for the ornament of the Church," and Ordericus Vitalis uses the emphatic words, "There was not a more splendid fortress in Europe."

The dominating part of the structure was, no doubt, the massive central donjon or Norman keep (an approximate judgment of which may be formed by reference to the contemporaneous keep of Rochester, still standing), a square double-walled building, containing the state apartments of the sovereign; and deep below, the prison vaults. The ballium or court around this keep was environed with subordinate towers, and other buildings for warehouses, kitchens, and barracks. Then we descend to the moat, whose inner bank bristled with wooden palisades, and across which the fortified passage appears to have occupied much the same place as the modern roadway, on the north side. In completing the defences, the engineer drew his lines around a considerable space lying beyond the moat, constituting what was called the barbican, guarded in like manner with turreted walls. The strength of the gangway in this direction, that is, towards the town, may be estimated by the fact that it was furnished, at suitable intervals, with no less than seven or eight portcullises.

In 1146, Stephen, suspecting Bishop Roger favoured Matilda's pretensions to the crown, ordered the Bishop of Ely, who was then holding the castle for Roger, to hand over to him possession of the castle. This he refused to do; upon which Stephen laid siege, but perceiving that, owing to the great strength of the edifice, the siege would be long protracted, he resorted to the following expedient: Having ascertained Matilda of Ramsbury, the Bishop's "Lady," was also in the castle, he erected a tall gibbet on an opposing eminence, still called "Gallows Ditch," and forthwith announced to the dame that its object was for the immediate execution of her son, the Chancellor, unless she prevailed on the Bishop of Ely to surrender the place, adding also, that neither was her lord, the Bishop of Sarum, to be suffered to eat or drink until the terms were complied with. To heighten the scene he caused the unhappy Chancellor to be arrayed in irons, and, with a halter hanging about his neck, to be led, in company with his aged father, to the very gates of the castle, for the purpose of exercising their personal influence on her feelings. The Bishop of Ely remained inexorable. For three days the king subjected his unfortunate prisoners to all the miseries of ignominy and famine. They were confined in vile and loathsome hovels awaiting their doom. At last Matilda contrived to elude the watchfulness of the Bishop of Ely, and delivered the fortress into the hands of

Stephen, thus saving the lives of her son, the Chancellor, and his father.

The castle was shortly afterwards occupied by the Empress Matilda; she had fled thither to take refuge from the persecutions of Stephen, who followed her there. In order to avoid being taken prisoner by Stephen, she caused herself to be carried out of the castle in a coffin, and was conveyed in the latter as far as Gloucester. In 1149 the castle passed into the hands of the crown, and was given as dower to the wives of various kings, viz.: The Empress Matilda, Marguerite of France, Philippa of Hainault, Anne of Bohemia, Joanna of Navarre, Marguerite of Anjou, Elizabeth Woodville, Elizabeth of York, Catharine of Arragon, Catharine Howard, and Catharine Parr.

In the reign of Henry II. the castle, with the lordship of Devizes, soon became one of the most important grants in the monarch's bestowal, and seems generally to have fallen to the lot of some special court favourite. Its dignity was enhanced by its ranking among the royal castles and State prisons, and its revenues were secured by an almost princely catalogue of feudal appendages. When made entire, the gift appears to have comprised—the castle of Devizes, body and members, the towns of Devizes and Rowde, with the advowsons of their churches, two parks of Devizes, the custody of the forests of Chippenham, Melksham, Pevesham, La Cofand, and the warrens of Marlborough.

Duke Robert of Normandy and Hubert de Burgh, Earl of Kent, were incarcerated in the dungeons of the castle. But after a prolonged imprisonment Hubert de Burgh managed an escape on Michaelmas eve, 1233. The Earl of Pembroke was much attached to Hubert, and was in the castle at the time; he carried Hubert out on his (the Earl of Pembroke's) shoulders, as the weight of De Burgh's irons impeded his movements. Hubert was borne safely through the area of the castle, thence through the "ostium," and with great difficulty across the foss, thence to the church of St. John, where he was deposited on the steps of the high altar.

The castle was besieged, and taken by Cromwell in 1645. The artillery having arrived from Trowbridge, Cromwell forthwith directed a battery mounting ten guns to be constructed in the market-place, within pistol-shot of the castle, and on the next day, Sunday, September 21, he sent in a final summons to the governor, Sir Charles Lloyd, to deliver up the place for the use of the king and parliament. As soon as Monday dawned the cannons opened upon the devoted citadel, and continued to play all that day and the following night. On Tuesday a grenada fell into the old roofless keep, where Sir Charles had deposited his powder magazine. The explosion of the missile, though it killed several men, did not ignite the powder, but apprehension of another such contingency brought the Royalists to immediate terms.

## THE SUNDERLAND HALL DISASTER.

THE inquiry held in regard of the lamentable disaster at the Victoria Hall, Sunderland, has resulted in a verdict setting forth that the victims met their deaths by suffocation on the stairs leading from the gallery, through the partial closing of a door on the landing, the door being fixed in its position by a bolt in the floor, but by whom there was not sufficient evidence to show; that the managers of the entertainment deserved censure for not having provided sufficient caretakers and assistants to preserve order in the hall; that the modes of entrance and exit in the hall were sufficient, except as regards the door, &c. Whether the verdict will prove satisfactory to public opinion remains to be seen, but it is well to recall what we have before stated, that the fatal door was an afterthought on the part of the owners, for which Mr. Hoskins, the architect of the building, was no more responsible than would be the late Mr. G. E. Street if Her Majesty's judges were to cause alterations to be carried out with regard to the internal arrangements of the New Law Courts. It is quite necessary to insist on this point, seeing the remark lately made by a contributor to the columns of the leading journal, that "an architect plans a building with the most anxious care for life, yet for want of imagination he fits a certain door to the building which enables any person to bring about wholesale destruction. Some day, the stupidity and the bolt are conjoined, and then we have such a massacre as that now under consideration at Sunderland."

The door was fixed in its position by a local joiner, by order of the proprietors.

## MANCHESTER BUILDING EXHIBITION.

THE Building Trades Exhibition, to be held in St. James's Hall, Manchester, will be opened on Thursday, July 19. The various sections will comprise architectural adornments and decoration, architectural drawings and designs of work, construction, sanitation, ventilation, paints and colours, joinery, furniture, paving, smoke abatement, and other matters. The sections will be made up as follows: Architectural adornments and decoration: wall papers, flocks, dadoes, friezes, designs, manipulative processes, staining, plaster, papier-mâché, encaustic tiles, statuary, marble,

scagliola, mosaics, terra-cotta, carved stone and wood, painted and stained glass, pottery, hand-painted china, turnery, mantelpieces and ornamental grates, architectural drawings, &c. Construction: bricks, stone, concrete, cement, plaster, damp coursing, tiles, slates, metal shingles, wood, iron, glass, and all other materials and manufactures used in building. Sanitation and ventilation: methods of ventilating buildings, sewers, &c., smoke preventers, draught regulators, self-cleansing and other cisterns, water purifying apparatus and filters, traps, sinks, closets, lavatories, baths, water meters, and other sanitary appliances. Paints and colours: dry and mixed paints, distemper, oils, varnishes, white and red lead, brushes of all descriptions. Doors, frames and mouldings, windows, staircases, parquet and other flooring. All descriptions of useful and artistic furniture, bedsteads, bedding, carpets, curtains, mirrors and looking-glasses, organs, harmoniums and pianos, cabinet work. Paving: stone, wood, concrete, asphalt, tiles, and kerbs. Smoke abatement: open coal fire grates, stoves of all kinds in operation, and other inventions for preventing smoke; appliances for heating rooms and buildings by hot air, hot water, and steam; smoke consuming and mechanical stokers, boiler furnaces, &c. Mr. A. Darbyshire, F.R.I.B.A., is the consulting architect and director. The hall will be ready for the reception of exhibits on Thursday, July 12.

### EGYPTIAN ANTIQUITIES IN ROME.

SINCE the discovery of the obelisk and the Andro-Sphinx of basalt behind the apse of Santa Maria sopra Minerva, at Rome, which were described in *The Architect* last week, a cynocephalus in black granite and the lower portion of a large three-sided candelabrum of Parian marble have been found. A second cynocephalus found on the site of the Temple of Isis and Serapis has been brought to the surface, but, like the first discovered, half of the face is wanting. The nature of the fractures, not only on these, but on the candelabrum and sphinx, show clearly that the temples must have been wrecked, and the divinities and ornaments willfully mutilated during some outburst of religious excitement.

The obelisk has been entirely uncovered. It measures 77 centimètres along each side of the base and 6 mètres 45 centimètres in height. It is proposed to erect it in the Piazza of the Roman College, which is closely contiguous to the spot where the stone was disinterred. It bears the cartouch of Rameses II., of the nineteenth Theban dynasty, the oppressor of the Children of Israel, and dates, therefore, from the time of Moses. The Andro-Sphinx and the first cynocephalus found are beautiful examples of Egyptian art. The features and details are carved with wonderful delicacy, but, unfortunately, they are both much injured. The nose of the sphinx had evidently been placed in the temple here. The right side of the face of the cynocephalus is wanting. Its eyes were made of cement or precious stones, for the one orbit left is hollow. The cartouch on the breast of the sphinx is read by the Roman Egyptologists as that of Aahmes II., of the twenty-sixth dynasty. The partly obliterated hieroglyphics on the base of the first cynocephalus dug out were conjectured to mean the name of Nakthorheb, of the thirtieth dynasty, and now the perfect cartouch of that Pharaoh is found on the plinth of the second cynocephalus.

### BUILDING REGULATIONS FOR GLASGOW.

A DEPUTATION from the Glasgow Institute of Architects waited upon the Lord-Advocate at the House of Commons on Friday in last week to urge the deletion from the Burgh Police and Health (Scotland) Bill of all clauses relating to building, and to advocate the incorporation of those clauses in a separate Act. The gentlemen present were Mr. James Thomson, president of the Institute; Mr. John Honeyman, and Mr. Campbell-Douglas.

Mr. Thomson stated that the members of the deputation had advocated for many years the adoption of regulations for building separated from the Police Bill. They were convinced that it was hopeless to expect many different corporations to act in concert in a matter of this kind, and they did not think that such a measure as they desired should be introduced by a private member, but by the Government. The principle they desired to state was that laws relating to the construction of buildings could be best framed and carried out by architects, who devoted their whole time and attention to the subject. The laws that were necessary for the proper use of buildings they proposed to leave to the administration of the Police Commissioners. In London there existed such an Act as they desired to see passed—the Metropolitan Buildings Act, which became law in 1855. This Act had worked satisfactorily since that year, and they desired to see a similar measure passed for Scotland, and particularly for Glasgow. They did not appear as owners of house property, but as advisers of the owners of property accustomed to appreciate the effect of those laws which related to heritable property and proprietary rights. They agreed with the Glasgow

Landlords' Association in thinking that many of the clauses in the new Police Bill were objectionable, but they highly approved of it becoming law if duly amended.

Mr. Honeyman corroborated what had been stated by Mr. Thomson—that their earnest desire was that the Legislature should adopt precisely the same course with regard to Glasgow and other towns in Scotland as had been followed with respect to London in 1855. They had the Metropolitan Local Management Act of 1855, and the Metropolitan Building Act of 1855, and now they desired to have a Burgh Police and Health (Scotland) Act and a Burgh Building (Scotland) Act. They submitted that the experience of the past twenty-eight years had amply proved the wisdom of separating the building clauses from the General Police Act, especially by the working of the Building Act, under which an enormous amount of work had been done. The London Act secured more substantial benefit to the public and more even-handed justice to the building owners than any other building law that had been devised. The proposal to apply it to Scotland would beget much opposition, but he did not think that should be considered an insuperable objection in view of the benefit that would be conferred. The London Act stated distinctly what the person about to build must do in the interests of the general community, and provided that at every stage of the work he must deal with a thoroughly qualified surveyor who was responsible to a local authority, and preserved the person building from delay and loss which might arise, especially in small burghs, from the manner in which the local authorities supervised building operation. The machinery of the London Act not only protected the building owners, but it provided for that strict enforcement of the law which only a skilful administrator could command.

Mr. Campbell-Douglas also spoke, submitting that all matters concerning the construction, reconstruction, or repair of property ought to be left in the hands of those who, from their special education and training, were, as a matter of course, most competent to supervise such matters. They also thought that those professional men ought to have the right on behalf of the community of seeing that clear and specific laws were laid down in all matters of construction. Owners of property or ground for building purposes had the right to know to what rules they must conform, so as to satisfy the law. They did not think building construction ought to be legislated for in a Police Bill, but that such a Bill should only take cognisance of property that had been already built.

The Lord Advocate then pointed out that there were a good many clauses in the Police Bill which did not so much aim at security of construction in buildings as at the benefits which they would confer for health purposes. Mr. Honeyman said it was not intended to interfere with those clauses dealing with sanitary matters. All matters such as the improvement of streets and drainage ought still, in their opinion, to be left in the hands of the local authorities. They simply desired to eliminate all clauses relating to reconstruction. The Lord Advocate had no doubt they would be aware that the building clauses had hitherto been administered under the General Act, and they had operated very satisfactorily under the Dean of Guild Courts and Commissioners of Police. Mr. Honeyman believed that in such cases as Glasgow they were likely to be well administered, but in smaller burghs the difficulty of administration was greatly increased. There were fewer men in those burghs who practically understood such matters, and he found that as a rule small burghs did not employ surveyors of the same efficiency as those who performed the work in large burghs. The Lord Advocate said there would be only two alternatives to securing such a high degree of skill as the deputation sought. Either the central government which they proposed to establish would have to look after buildings in all the burghs, or else it would be compulsory to have a skilled architect employed in each burgh. The latter course he considered would be impracticable. He did not much like the notion of setting up a government inspection of buildings of a very minute kind all over the country. It was a strong proposal. Mr. Honeyman admitted that the proposition they made was a radical change in the present mode of administration, but the deputation were strongly of opinion that it might be possible to make an exception in the case of Glasgow. The Lord Advocate asked what degree of authority would be proposed to be given to architects over the buildings in particular localities? that they should pass plans in the same way as Deans of Guilds or Commissioners of Police? Mr. Honeyman replied that he should pass them exactly in the same way as the district surveyor does in London. It would be his duty to see that the builder conforms to the Act, and he should also inspect the work during its progress. The Lord Advocate asked if there ever had been a proposal to extend this Act to the whole of England under the direction of a central authority? Mr. Honeyman said he made the proposition at a conference of architects in London some years ago, and it was very favourably received.

The Lord Advocate then, addressing the deputation generally, said the ideas which they had laid before him were somewhat new. The measure which they proposed would be a wide-reaching one, affecting a great many people, and it would be necessary to have the sanction of prevalent public opinion before proceeding with it. He did not think it would be advisable that any man or any

Government should introduce such a Bill into Parliament without having well ascertained the general feeling of the public upon the subject.

The deputation then withdrew.

#### Goldsmiths' Company's Prizes.

SIR,—I am sorry my not having sent any description to accompany your illustration of the silver work in last week's *Architect* should have caused an error of statement respecting it.

The salad-bowl was only one of several subjects given, some of workmanship, and others of design; and the prize, although sufficiently generous, was the comparatively modest sum of 15*l*.

I am, yours obediently,

July 2, 1883.

W. R. LETHABY.

#### Reform in Modern Costume.

SIR,—Mr. Gotch has called attention in the pages of a contemporary to some possible reforms in modern costume. This subject is so peculiarly fit for discussion in your paper, which has from the very beginning been devoted to what the late Sir Gilbert Scott termed the "Arts accessorial to Architecture," that I venture to add a few suggestions.

Since the abandonment of crinolines, ladies' costume has, at rare intervals, exhibited such beautiful and sensible fashions that one can only pray that the fair creatures may not only know when they are right, but act upon this conviction by not going astray again. Many of them are now trying our sense of beauty very sorely by wagging about in crinolettes, and many—very many—are trying our deeper feelings (bearing in mind II. Corinthians, chap. ii. verse 15) by cutting their hair quite short. This may be a result of the prevalent rage for burlesque actresses attired (?) as—and yet as much as possible unlike—men; a custom most laudably set at defiance by Mr. Gilbert in all his light operas, where all the men are men, and all the women are women, and consequently far handsomer and more beautiful than when they are transmogrified. There is nothing more beautiful in costume than hanging drapery, but it should be chiefly hung from the widest part of the body, from the shoulders of men and from the hips of women, and the draped fairies in "Iolanthe" may be safely backed against all the regiments and battalions of undraped *figurantes* at other theatres for beauty in costume.

The attribution of short hair to the example of burlesque actresses may, however, be resented by some ladies, so we will say that it is for convenience in drying it, in view of the forthcoming sea-bathing season.

Women's fashions are so ephemeral, owing to the passion for novelty, that the only thing we can do is to guard our collections of Mr. du Maurier's drawings in *Punch* and elsewhere (fashion plates are useless) in order to select graceful figures from them for our use in decorative painting and sculpture. I had the honour of reading before the Architectural Association (I won't say how many years ago) a paper on "Figure Drawing applied to Architecture," with the object, partly, of making our painting and sculpture—as our architecture should be—*emphatically modern*, and I attacked the same points in men's costume that Mr. Gotch does, namely, the head and ankles; to these he adds the wrists. His suggestions are, in my humble opinion, excellent; but the edge of his wedge is not nearly thin enough—the transformation must be far more gradual and insidious in order to lead to any result. Neither do I believe that the discarding of linen shirts for jerseys, as he recommends, would find a welcome amongst English gentlemen. He cannot surely be dead to the ambrosial balm of a clean shirt, especially after an afternoon's exercise in his favourite flannels and jerseys. I have heard an answer attributed to Beau Brummel who, when asked what he considered the sweetest scent to use, replied "country-washed linen, and *plenty of it*." The mistake that we make is over-starching. Pity the sorrows of a poor young masher trying to look at his "button-hole" over the edge of his metallic gorget without the aid of a looking-glass! But we may still be clean, as well as comfortable, in linen, with less starch and more sensible forms in our collars and cuffs.

There is a great comfort in getting rid of the heavy coat sleeve when at work, and we might unobtrusively take a hint from a bygone fashion of arranging it to slip on and off with the help of a few buttons, which would be unnoticed until the fashion has redeveloped into a more pronounced form, such as was common in the fifteenth century, for instance. An equally gradual improvement might benefit our ankles, by our sewing on two or three buttons and button-holes, so as to tighten the trousers around our boots in muddy weather; this would be far less unsightly than turning them up and ruining them in the eyes of our tailors. I have heard someone sententiously pronounce "they are never the

trousers they were" after this horizontal creasing operation has been performed.

Now for our heads. And here I wish to be particularly polite to the mashers, who have succeeded in lowering the crown and widening the brim of our "chimney pots" to sensible proportions. I could not wear such a hat just now for the world, because it would not look professional. But, dear mashers! sweet mashers! elegant mashers! flowery potato mashers! *would* you make one *little* alteration in the outline of your crowns, and, instead of increasing in diameter upwards, let them diminish. A hat widening upwards requires a beard and flowing hair widening downwards to balance it; but as you don't let your hair grow like a picturesque Russian priest, you should not wear an overhanging crown like his.

Thanks to bicycling we have the pleasure—and a very sincere pleasure it is to me—of seeing muscular calves in action about our streets, but it will be a long time before a gentleman can be considered "dressed" when in his bicycling costume. Meanwhile I hope he may be freely admitted to appear on our buildings in the form of sculpture; and I believe that even the slight alterations that I have suggested for our heads, wrists, and ankles in *ordinary dress*, would admit of its being rendered in modern sculpture as well.

Your obedient servant,

EDWARD J. TARVER.

P.S.—The late Prince Consort once suggested the sloping crowned hat, a fashion which H.R.H. the Prince of Wales might therefore be pleased to adopt.

#### Fireproof Floors.

SIR,—As a subscriber I should be glad if any readers could give a description of the best method of forming fireproof floors between residential chambers, having due regard to the prevention of sound and to the conditions of the Metropolitan Building Act. Hitherto I have formed the same with rolled iron joists, about 2 to 3 feet apart, filled in with concrete, the under side being plastered for ceiling, the 4½ by 2 feet joists being laid the reverse way on the iron joists and covered with battens. This method does not prevent sound, however, as well as one would wish, and I fear cannot be considered fireproof.

Yours obediently,

C. H. W.

#### LEGAL.

##### Worcester County Court.

(Before Sir RUPERT KETTLE, Judge.)

HUGHES v. PORTER AND ANOTHER.

In this action the plaintiff, Mr. Frederick Hughes, of Bath Road, Worcester, architect, sought to recover the sum of 9*l*., the balance of an account alleged to be due from the defendants, Mr. S. Porter and Miss E. Askew, of Upper Park Street, Worcester. Mr. Halford (from the firm of Messrs. F. & H. Corbett) was for the plaintiff; Mr. Beauchamp appeared for the defendants. Only the female defendant appeared. Mr. Halford stated that one of the defendants, Samuel Porter, had formerly carried on business as a carpenter in Worcester, but disappeared some time ago. Porter and Miss Askew, jointly, called upon plaintiff to prepare plans for the building of a house, and now Miss Askew denied her liability. Plaintiff said that some time in March 1882, Porter and Miss Askew called upon him, and Miss Askew told him she wanted to build a house worth about 250*l*. on a piece of land belonging to her in Wild's Lane, and he knew that she had property there. He knew that Porter had no property. He had frequent interviews with the defendants about the house, and he prepared plans, which were put in. In reply to His Honour plaintiff admitted that he regarded Porter as Miss Askew's agent, but believed he was doing the work for Miss Askew. He admitted also that he had sent the plans in Porter's name, and a receipt bearing a signature for *id.* by Porter was put in. His Honour (to plaintiff): My sympathies are with you, but the law is against you. You will have to find Porter, then you can serve him. Judgment for Miss Askew.

##### Hammersmith Police Court.

##### DEFECTIVE BUILDING.

Mr. Browne, builder of six houses in Brackenbury Road, Hammersmith, was summoned before Mr. Shiel by the Metropolitan Board of Works for dangerous construction. Each house has on the ground floor a bay window; the opening in the wall admitting the bay window is eight feet wide, and is bridged over by a badly-constructed beam, which has deflected and fractured the brickwork resting on it.

Mr. Knightley, district surveyor, produced a model of the beam, a rubbing of the brickwork with a level line drawn upon it that the deflection might the more easily be understood; he also gave the deflection of each beam, and submitted a drawing showing the

proper manner of trussing a beam. The magistrate inquired if the brick on edge was a brestsummer, but upon being told that a brestsummer was made of wood not of bricks, he said he knew nothing about such things; the case must be referred to an architect. Mr. Roberts, representing the Metropolitan Board of Works, refused assent until instructed by his Board.

The Metropolitan Board of Works, having a large number of dangerous structure cases to deal with, and having no power to recover extraordinary expenses, objected on principle.

When the case came on again before Mr. Sheil, Mr. Reade, engineer, gave evidence as to the insecurity of the structures, the unequal power of the brestsummers to support the load, and was followed by Mr. Thomas, of the Metropolitan Board of Works' Dangerous Structures Department.

Two professional witnesses were called for the defendant. Both admitted they were not members of either Architects' or Engineers' Institutions, but had examined the buildings, and found nothing amiss; the brestsummers had deflected a quarter of an inch, and usually did so of their own weight—evidence which will surprise most constructionists. Mr. Sheil said he could not understand the question, so dismissed the summons. The interesting structures, therefore, are to remain.

## ART WORKMANSHIP.

**Stained Glass in Lerwick Town Hall.**—Messrs. James Ballantine & Son, Edinburgh, have nearly completed the commission with which they were intrusted for the filling in of several windows of the newly-erected town hall at Lerwick with-stained glass, illustrative of events in the history of the northern islands. The two principal windows, which are 13 feet in height, are ready for delivery, and will be placed in the south gable of the building. One of these is given by the Earl of Zetland, and the other by Sheriff Thoms. The former is in memory of "Harold the Fair-haired," and Jarl Rognvald, the first king and the first earl of Orkney. These ancient rulers are represented in nearly life-size, while underneath the figures are small groups illustrative of the landing of Harold in Shetland A.D. 870, and the investiture of the Earl of Orkney. The corresponding window, bestowed by Sheriff Thoms, shows the figures of Archbishop Eystein, of the ancient metropolitan see of Orkney and Shetland, and Bishop William the Old, the first bishop of the diocese. Underneath are representations of the consecration of King Magnus by the Archbishop, and the founding of St. Magnus Cathedral. At the top of the window are the arms of Norway and Thronhjelm.

**Huntington.**—A stained glass window has just been inserted in the chancel of Huntington Church. It is the gift of Mrs. Bennett, of Millcrooks, and is erected to the memory of her husband, the late Mr. James Bennett. The window is of two lights, and the subject is the Apostles Peter and Paul. The four archangels, distinguished by their emblems, fill the tracery above. The chancel now possesses three stained-glass windows, thus completing the work. The window has been executed from designs by Mr. D. A. Walter, architect, of Hull.

## GENERAL.

**Signor de Fabris**, the architect of the new front of the cathedral at Florence, died on June 28 at Florence, on the eve of the day appointed for uncovering his great work.

**The Society of Arts Conversazione** will take place on the evening of Wednesday, July 25, at the Fisheries Exhibition.

**Mr. Alma Tadema, R.A.**, and **Mr. Herkomer, A.R.A.**, are among the exhibitors at the International Art Exhibition, which was opened at Munich on Monday.

**The Rembrandt Society**, lately established at Amsterdam, has been formed for the purpose of purchasing paintings and drawings of the old Flemish and Dutch schools, when offered for sale either privately or at auctions, and so prevent their exportation to foreign countries, as has happened several times lately in Holland with respect to celebrated collections. The paintings thus secured for the country would be offered at moderate prices to Dutch museums and galleries. The Burgomaster of Amsterdam has promised his energetic co-operation with the society, which numbers some leading men among the merchants, artists, and connoisseurs of Holland.

**The Selection of a Site** in Canterbury Cathedral for the recumbent figure or altar-tomb which it is proposed to erect there as a national memorial of Archbishop Tait, has been made provisionally by Mr. Beresford-Hope, M.P., the Dean of Westminster, and the Rev. J. H. J. Ellison (one of the chaplains to the late Primate), who were accompanied by Mr. G. L. Scott, the architect, and Mr. Boehm, the sculptor engaged by the Executive Committee of the Memorial Fund. The site selected is immediately behind the archiepiscopal throne. The committee for the local memorial have decided on the erection of a sedilia.

**Mr. Charles R. Gribble** has been appointed architect to the Directors of the National Bank of England.

**The Sale of the Towneley Manuscripts** has realised a total sum of 4,054*l.* 4*s.* 6*d.*

**The Queen** by command has permitted the Institute of Painters in Water-colours to assume the title of "Royal," and is now to be styled the "Royal Institute of Painters in Water-colours."

**The Bristol and Gloucestershire Archæological Society** will hold their annual meeting at Bath on the 25th, 26th, and 27th, instead of, as originally intended, on the 31st and following days.

**An Anonymous Donor** has given 3,000*l.* towards the building of the permanent church of St. Alban the Martyr, Nottingham.

**The Cork Industrial Exhibition**, described as the best which has yet been held in Ireland, was opened on Tuesday by the Lieutenant of the county, Lord Bandon. An illustration of the exhibition buildings appeared in *The Architect* of June 16.

**Messrs. Carpenter & Ingelow**, architects, have made a report stating that the tower of Sherborne Minster is unsafe, and that it will be necessary to rebuild it.

**"The King's Gateway,"** by Mr. Briton Riviere, R.A., was sold by Messrs. Christie & Manson on Saturday for 1,270*l.* 10*s.*; and a picture, *The Rising of the Nile*, by Mr. F. Goodall, R.A., realised 1,197*l.*

**The Preamble** of the Manchester Ship Canal Bill has been proved, subject to conditions imposed on the promoters.

**Mr. Hebb**, assistant architect to the Metropolitan Board of Works, will be for a time relieved of all other work, so that he may give his whole time and attention to the metropolitan theatres and music-halls.

**The Sheffield Society of Local Artists** opened their ninth annual exhibition of works on Saturday last.

**The Emperor of Germany** has promised 12,500*l.* to found a hospital on the island of Norderney, in the German Ocean, if an equal sum be made up by private subscription.

**Manchester Cathedral.**—The demolition of the north gallery of the cathedral was begun on Wednesday. Before Sunday next it is expected that this never very slightly adjunct to the cathedral will be entirely cleared away, and steps will shortly be taken to carry out Mr. Crowther's plans for the erection of the new north porch, and other necessary alterations and restorations.

**A Panorama** of the battle of Tel-el-Kebir was opened on Wednesday at Westminster. Mons. Olivier Pichat is the artist.

**The Building Committee** of the Birmingham School Board intend to obtain plans for schools to accommodate 1,000 children on sites in Cowper Street and Stratford Road.

**The Electric Lighting of the Royal Courts of Justice** is considered to be a success. The central hall is illuminated by six Crompton arc lamps, each of 4,000-candle power, and the courts and corridors by Swan incandescent lamps. There are from 22 to 24 lamps in each of the twenty courts, and upwards of 20,000 yards of conducting wires are laid within the building.

**The Iron Roofing** for the new markets at Ebbw Vale has been placed in the hands of Mr. A. D. Dawney, Assoc. Inst. C.E., for execution. The roof for the Blaenau markets, recently opened, was constructed by the same firm. Mr. E. A. Johnson, of Abergavenny and London, is the architect for both markets.

**The Promenade Pier in Ramsgate**, which was constructed about a year ago at a cost of over 12,000*l.*, is to be sold by auction on Saturday next, the 14th inst., under a liquidation order.

**The Plans** for extensive alterations and additions to the Swansea Union Workhouse have been approved, and tenders will shortly be asked for. The estimated cost is 24,000*l.* Messrs. W. D. Blessley & Aspinall, of Cardiff, are the architects. The same firm have also prepared plans for an extension to the Bedwelty Union Workhouse, Tredegar.

**The Hove Commissioners** have decided to carry out forthwith the scheme prepared by Sir John Cooke for a sea wall and groynes for the defence of the lawns and foreshore of Hove, at a cost of about 25,000*l.*

**The Wednesbury Local Board** have decided to adopt surface drains and intercepting sewers to convey the sewage of the town and storm water combined to some spot hereafter to be selected, and there dealt with. It is estimated that the scheme will cost 30,000*l.* less than by a system of deep drainage.

**The Foundation-stone** of the Northumberland Avenue Hotel will be laid on Thursday, July 19. The hotel is being erected from the designs of Messrs. Isaacs & Florence, for the Northumberland Avenue Hotel Company. This hotel, it is believed, will be the largest and most commodious in Europe. The floors will be fire-proof, and there will be escape staircases from every floor. All the rooms will be well lighted and well furnished, and will be let at moderate charges, including the use of an unusually extensive suite of public rooms, having all the accommodations and comfort of a good club.

# SUPPLEMENT

TO THE

# ARCHITECT

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, JULY 7, 1883.

### COMPETITIONS OPEN.

**NEWCASTLE-ON-TYNE.**—July 30.—Designs are invited for a Hospital for Infectious Diseases to be built on a Site near Heaton Junction. Subject to certain conditions, the successful Architect will have the carrying out of the work, and a premium of 50% will be divided between the second and third competitors. Mr. Hill Motum, Town Clerk, Town Hall, Newcastle-on-Tyne.

### CONTRACTS OPEN.

**BERKHAMSTEAD.**—July 9.—For Building Tramp Wards at the Workhouse. Mr. William Huckvale, Architect, Tring.

**BIRMINGHAM.**—July 21.—For Building Liberal Club. Mr. J. A. Cossins, Architect, Warwick Chambers, Corporation Street, Birmingham.

**BLOXWICH.**—July 7.—For Erection of Public Buildings. Mr. F. E. F. Bailey, Architect, Walsall.

**BRIGHTON.**—July 12.—For Forming Garden Enclosures on South Side of Western Esplanade. Mr. P. C. Lockwood, Borough Surveyor, Town Hall, Brighton.

**BROMFIELD.**—July 7.—For Erection of Farm Buildings. Messrs. Pickering & Crompton, Architects, Whitehaven.

**CAMBRIDGE.**—July 16.—For Construction of a Building for the Enlargement of the Guildhall. Mr. Edmond Foster, Town Clerk, Guildhall, Cambridge.

**CANTERBURY.**—July 8.—For Additions to Barton Mill. Mr. J. G. Hall, 4 St. Margaret Street, Canterbury.

**DARLINGTON.**—July 12.—For Building Fifty-five Houses. Mr. William Hodgson, Architect, 1 North Terrace, Darlington.

**FYFIELD.**—July 10.—For Building Truants' Home for Eighty Boys. Mr. J. T. Newman, Architect, 2 Fen Court, E.C.

**GOOLE.**—July 12.—For Building Sailors' Institute and Dwelling-house. Mr. W. Alfred Gelder, Architect, 7 Saville Street, Hull.

**GORLESTON.**—July 12.—For Building Group of Schools with Boundary Walls, &c. Messrs. Bottle & Olley, Architects, Regent Street, Great Yarmouth.

**HEBDEN BRIDGE.**—July 14.—For Building Schools, Board Room, Caretaker's House, Boundary Walls, &c. Mr. John Sutcliffe, Architect, Romfield Buildings, Todmorden.

**MORLEY.**—July 11.—For Extension of Peel Street School. Mr. J. Sykes, Architect, Queen Street, Morley.

**SEELY OAK.**—July 9.—For Repairs to Workhouse. Mr. George Ingall, Architect, Temple Row West, Birmingham.

**THORNTON-IN-CRAVEN.**—July 9.—For Restoration of Church. Messrs. Waddington & Son, Architects, 5 Grimshawe Street, Burnley.

### TENDERS.

#### ATHERSTONE.

For Additions to Drawing-room, &c., Sheepy Hall, Atherstone, for Mr. C. B. Love, J.P. Mr. WILLIAM TOMLINSON, Architect, Coventry.

Fox Bros. . . . . £372 0 0

Allow for old materials . . . . . 21 0 0

Total . . . . . £351 0 0

Shilton, Stoke Golding . . . . . £340 0 0

Allow for old materials . . . . . 18 0 0

Total . . . . . £322 0 0

Shilton, for conservatory, not including heating and-stands, &c. &c. . . . . £115 0 0

#### BLAINA.

For New Board School for 1,200 Children, including Out-buildings and Master's House and Board Room, Blaina, Mon. Messrs. W. D. BLESSLEY & ASPINALL, Architects, Cardiff.

JENKINS, Brynmawr (accepted) . . . . . £8,495 11 0

#### ACCRINGTON.

For (Contract No. 2) the Construction of 3 feet 6 inches by 2 feet 4 inches Brick Sewer in Hyndburn Road, Union Street, Blackburn Road, and Abbey Street; for 3-foot Brick Overflow and 15-inch Pipe Sewer in Blackburn Road; for 18-inch and 15-inch Pipe Sewers in Abbey Street and Manchester Road, with Man-holes, Lampholes, &c., for Accrington. Mr. E. KNOWLES, Borough Engineer.

Hunter . . . . . £2,283 0 0

Rambottom . . . . . 1,940 0 0

SHARPLES (accepted) . . . . . 1,887 0 0

For Main Sewerage Works (Contract No. 3), Accrington.

Rambottom . . . . . £1,800 0 0

**STAND No. 140. ROW G.**

# LINDSAY'S IMPROVED PATENT REVERSIBLE TREADS & LANDINGS FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

In Hospitals, or places where it is desirable to be free from dust, the blocks can be placed close together, not leaving any cracks, so that the treads or landings can be swept or washed quite clean; also, if it be necessary to get light under a Staircase or Landing, rough glass block can be fitted in the Iron frames, side by side with the wood, and a subdued light thus obtained.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be re-filled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works,

**13, 14, & 15 SOUTH WHARF, PADDINGTON, LONDON, W.**

## BELLMAN'S PATENT GULLY.

This Gully possesses the following advantages:—

**Receives and Disconnects one Rain-water Pipe and Three Waste Pipes.**

**Avoids all Splashing.**

**Ventilates the Pipes and Trap.**

**Forms Drain for Area or Surface.**

**Is Easy of Access for Clearance.**

The ordinary P or S trap to be used in connection with Gully being in a separate piece, can be placed at any angle to meet the drain exactly, thus ensuring a perfect joint, the Gully being fixed at right angles. This is a great advantage over other arrangements made with the trap in one piece.

*The Holes for Rain-water Pipes are made both Circular and Square and of various sizes.*

DESCRIPTIVE CIRCULAR ON APPLICATION.

**THIS GULLY IS HIGHLY RECOMMENDED by Authorities on Sanitary Matters.**

**PRICE AT WORKS, 8/6 EACH.**

Also SINGLE GULLIES, for Sink Wastes only, price 3/9 each.

**BELLMAN & IVEY, 95 Wigmore St., London, W.**

The following Illustrations, which have appeared in "THE ARCHITECT," can now be obtained in a separate form suitable for Framing.

**A Coloured Reproduction, by permission of  
THE FRENCH GOVERNMENT  
OF THE  
CELEBRATED FRIEZE,  
BY JULES DIDIER,**

Exhibited in the Salon last Season. In Nine Sections, price Sixpence each. Now ready. Sent by post, carefully rolled, price Sevenpence each.

May be obtained from all Newsagents or Booksellers, or at the

**OFFICE OF "THE ARCHITECT," 175 STRAND, LONDON, W.C.**

# The Architect.

## LADYLIKE ART.

**L**F the reflections we made bold to offer last week upon Gentlemanlike Art have been found to contain in any degree the element of good sense, our readers will not be likely to object to a continuation of the discourse on similar lines in the form of some remarks upon the subject of Ladylike Art. At any time, and under any circumstances, the treatment of artistic work by the feminine instinct and the feminine hand must be regarded as a most interesting question, whether considered philosophically or practically; but we will take leave to say that in English art work at the present day there is something in the part taken by women which is more than usually worthy of the most favourable attention.

Amongst well-known aphorisms there is one to the effect that women are born actresses. It would probably be more true to say—perhaps as a better way of expressing almost the same idea—that women are born artists. So simple a fact is this, and so readily recognisable, that it is not at all a difficult task to maintain the proposition broadly that all art is of a sort of feminine gender; as if one should say masculine science, feminine art; masculine strength, feminine finesse; masculine power, feminine grace. Illustrations are, indeed, so common that it is almost a superfluity to speak of them. The aptitude for self-adornment as a thing to live for, the delight in daintiness from the very cradle of infancy, the irrepressible love of all that is beautiful, the delicacy of touch in every kind of handiwork, the gentle, sentimental feeling for all poetic things, are instincts of the sex, not attributes of the individual. A few women (some of us are ungallant enough to say the fewer the better) may have in them the stuff that physicians are made of, politicians, preachers, philosophers; but there are few indeed who, except it be by accident, are incapable of becoming musicians, dancers, decorators, milliners of course, and dreamers generally of all sorts of dreams that are pretty and refined. Perceiving this, as we all must do, if there be not something about feminine art that turns out to be peculiarly charming because of the very femininity of it, then ought we to be signally disappointed somehow.

But it need scarcely be said in so many words that in the whole history of art the place of the female artist has always been an honourable one. So much is this so, that in painting and in sculpture, in poetry and in musical composition, women have been in all ages the welcome rivals of the best of men. To exaggerate their merits in the express direction of manliness is as undesirable here as it is in all else; but it is even still more especially unnecessary; for although, in some instances, as exceptions, a vigorous masculinity has been strikingly exhibited, yet in all cases the more natural characteristics of delicacy and daintiness have been sufficient to mark out for female artists a province which they could hold as their own, and which many of them have so held amidst the applause of all the world. Descending, however (if we may so say), from those higher eminences of art which are occupied by the few, to the more level ground which affords a firmer foothold for the many, how can it be questioned that the fine tact and versatile temperament of a woman must enable her to produce, both in design and in execution, something so graceful, as compared with the parallel work of a man, that its very deficiency in vigour shall be but a part of its characteristic elegance? Take, for instance, the work we see in London just now in such departments of art as flower-painting, china-painting, and needlework, and those of the harder sex who may be disposed to take credit for gallantry when they treat the generality of feminine Academy pictures with toleration, and even to disallow gallantry itself to disguise their opinion of feminine novels, and perhaps feminine poems, will not be able on any terms to persuade themselves that these so-called minor efforts are of minor merit, or the graces that are peculiar to them of less practical value to society. And if we descend (so to speak again) still further to those devices of dress which occupy so considerable a share of the

attention of the sex, and are frank enough to acknowledge that this devising of female attire is in sober fact the earliest and most continuous of all the arts of the beautiful in point of history, infinitely the most universal in its application over the whole surface of the globe, and in one sense the most varied, while in another the most unvarying of all the endeavours of human ingenuity, there can be no possible difficulty in discerning how essential an element in the construction of the female intelligence is the disposition to deal with the beautiful for its own sake and for the sake of its own joys. In short, without introducing into our argument any form of speculation as regards the origin or the cause of the intellectual difference between the typical man and the typical woman, it is too plain to be matter for debate that the mental constitution of the woman, as regards the entire province of elegant design, is just as different from that of the man as are her fingers daintily and delicately different from his.

What, then, are the particular fields of artistic work which women ought to be encouraged to cultivate? To those philosophers who are content to think that, because a man has a brain and a woman has a brain, therefore the brain of man and that of woman are obviously the same brain, like two triangles that are equal and similar, and, in fact, the same triangle, the answer is easy but wrong. The right answer seems to be that in the increasing division of labour, in art as in all else, the future function of the female artist will probably apply to those kinds of work in all branches which are the more delicate and graceful, the less imposing, the less formidable, certainly the less scientific and the less mathematical. The remarkable weakness, for instance, of the female hand and eye in respect of accurate geometry, even in dressmaking, is a point which we need only hint at in the vaguest manner, and leave to the tailors to explain if they will; but, on the other hand, what tailor would presume to build a bonnet, or what human being of the tailor's sex in all the world would assume the responsibility of decking it with flowers? Possibly we might say, if allowed to be so irreverently figurative, that woman is the milliner of art and man the tailor.

But there is another question which we have to raise. In speaking of Gentlemanlike Art, it was made clear enough that the difference between the art of a well-bred man and that of an ill-bred man is a real difference in favour of good breeding. Is there any equal or corresponding difference in the case of female artists? We hold that there is a corresponding difference, but not an equal difference. The reason of this distinction is that the art of a rough man is rough art, while the art of a rough woman involves a sort of contradiction in terms. That is to say, the woman who becomes an artist, within the meaning to which the word is usually restricted, can scarcely be rough, as no doubt many a sound artistic spirit of the other sex may be and is. Therefore, although there must be, in women as in men, a whole infinite range of gradations between the most refined and the least, yet, with exceptions of course, no feminine work worthy of the name will ever be rude, or altogether crude, or in any sense coarse or graceless. Now, inasmuch as the gentleman is really possessed by gentleness as the basis of his character, so the lady is possessed by a similar gentleness as the basis of hers. To make this a matter of dispute in either case would only be to play upon words. We may consequently venture to lay it down as a principle that Ladylike Art is so far of the same order as ladylike behaviour, the value of which every one can appreciate. Whether, in the article of bonnets, for example, the refined manners of the artist are found to produce a refined arrangement of the ribbons, flowers, lace, and other paraphernalia, and a refined adjustment of the whole air of the thing to suit the style of the wearer, far be it from us to pretend to know of our own knowledge; but we are credibly informed that what may respectfully be called a vulgar hand, as a rule, turns out a vulgar article. Now, if this is the case in a species of art which is (if we may say so without giving offence) pretty and popular and that is all, is it not reasonable to conclude that, as we ascend the intellectual scale of artistic merit, the superiority of intellectual power—of the feminine kind—will be more and more apparent, and therefore that good breeding, which in a woman is specially akin to intellect, must clearly manifest itself in the higher efforts of design, and in the higher efforts of execution also?

The practical conclusion at which we arrive need be no more than this: That the encouragement which is now being given on all hands to women of cultivated mind and refined

manners to take part in the artistic work of England is good policy, whether regarded as personal or national. As an artist of any kind, a ladylike woman is at least in her right place ; as an artist of the right kind she ought to be supreme.

## STUDIES OF SOME LONDON CHURCHES.

[BY A CORRESPONDENT.]

AT length the writer takes up his pen after a long interval\* and resumes the above subject, having been prevented, owing to more pressing occupations, from sooner putting the "Studies" into literary shape. Yet it is hoped his observations will not lose by this, and should alterations have since been made to any of the buildings described, this essay ought, at least, to have historic interest.

It will soon become a very difficult task for an architect to examine all the new churches, as the circumference of London gets larger and larger year by year. His peregrinations in the limits of the "City" itself, however, will be reduced, as notwithstanding the exertions of that most careful body (one that, alas ! should have been formed much earlier, before ruthless modern vandals had swooped down on first one, then another, interesting fane) the City Church and Churchyard Protection Society, some historic structure is almost annually razed to the ground. But in these times it is, unfortunately, not only City churches that are threatened, but any one that is supposed to block up a vista, or, by some stretch of the imagination, declared to be "in the way." For example, St. Clement Danes, Strand, has by some people been doomed, because it is considered to interfere with the access to the New Law Courts, and to spoil the view of the latter as one comes along the Strand. In the writer's humble opinion one of the most picturesque prospects in London on a fine sunny day is from the "knifeboard" of an omnibus going eastwards as the slight winding of the Strand gradually reveals the elegant St. Mary-le-Strand, at first appearing almost to block the thoroughfare, and then a little further on its scarcely less elegant companion St. Clement Danes, while the lofty and beautiful *flèche* on the great central hall of the Law Courts towers up in the distance. It may be remarked *en passant* how much more picturesque such streets are than the interminable Parisian boulevards, and how effective and artistic fine buildings standing in such a position as this are.

Go a little further eastwards past the majestic Palace of Justice, and commencing to descend Fleet Street, the grand outline of St. Paul's looms conspicuously in the background, seeming to bar all progress beyond the narrow defile of Ludgate Hill. Even at the risk of being considered an opposer of all progress, the writer cannot but think that when Ludgate Hill is widened, as is settled, and more of St. Paul's seen, some of the present effect will be lost. Not that such a manifest improvement should not be carried out, far from it, for we are bound to move with the exigencies of the times. If, when this was done, a good granite or solid stone viaduct to replace the Chatham and Dover Railway Company's pretentious iron structure was built, the cathedral, of which we are so proud, would not so much suffer by the alteration of its western approach. Situation is a very important element as affecting the external effect of churches. How many a building one can call to mind, the aspect of which has been well nigh ruined by a bad site and awkward surroundings. St. Martin-in-the-Fields is an example of a church admirably adapted to its surroundings, and in a noble position. The interior is so well known that the writer need not comment on it, except to remark that it is unfortunate the galleries form no constructional feature of the church, being merely "scribed" to the piers. There is no doubt the fine proportions of the building would be better displayed were the galleries removed. But as externally provision has clearly been made for them by two ranges of windows, the *raison d'être* of such design would in that event be abolished. But there is no likelihood of the galleries being molested, particularly as the neighbourhood is to some extent a residential one.

As in the previous "Studies," it is not the intention of the writer to describe very methodically the churches commented upon, but rather to touch upon each in such a fashion as to bring out a few of the salient points. Sometimes the contem-

plation of a single detail in a church may call up a train of reminiscences of features in other buildings *à propos* to it. To follow them out may not be unprofitable, bearing in mind that relevancy has to be considered. One of the delights of travel to an architect who has a fairly retentive memory, is that the precious stones of experience and observation, picked up in many a pleasant trip, are sure to more than realise their value years and years afterwards, if judiciously selected and recut to advantage. No change in marketable rate will affect them ; they will always have their intrinsic worth, whether in the shape of sketches or written notes, or of impressions on the brain.

Let the reader proceed to the *Church of St. Anne*, South Lambeth, and he will see there a successful transformation of a very unecclesiastical-looking "Georgian" edifice. This has been so much recast and altered as to appear almost to have been rebuilt in a kind of Romanesque style. It is a real pleasure to see a most uninteresting-looking structure (formerly South Lambeth Chapel, consecrated in 1869), not metamorphosed into a churchlike building, with a chancel added. The treatment of the internal splay to the windows—a point which should be more looked after than it often is—is very natural ; a  $4\frac{1}{2}$ -inch plastered reveal, then the splay, so as to avoid cutting the bricks more than can be helped. But the sudden transition from this splayed reveal to the square order above the springing line of the rear arch is not very successful ; a more gradual change would have been better. The manner also in which the corbelling out to the shaft of the chancel arch a little way down the springing line is managed is crude. The corbel should either have been made a distinct feature or abolished altogether. It is in these little refinements that the real difficulty of design lies, and nothing but intuitive perception or long practice and experience can produce the desired result. Perhaps there is no single feature in a building which is a truer test of a good eye for proportion, and the skilful hand of the artist, than a gable-cross or the weathercock to a spire. These features stand conspicuously backed by the skies, and, if they are not successful, the remaining details rarely are so. In the glazing to the windows of St. Anne's, the horizontal joints in the square quarries and those to the borders are continued through in a line. It would be better for appearance, certainly, if the joints had been broken.

It is a pleasing surprise, after traversing the dingy Blackfriars Road, to come upon a well-cared-for interior like that of *Christ Church*, Southwark, for the ugly exterior, destitute of any architectural character, built of dull brick, begrimed with London smoke, and guiltless of any freestone dressings, little prepares one. Perhaps it is as well, for in how many notable churches—particularly continental ones—does the uninteresting external shell cover a charming kernel, which, after all, is the most important part of the church. The same remark holds good as regards many a quiet little English village church, where the trouble the traveller experiences in getting the keys, in no wise daunted by the unpromising exterior, is amply rewarded. In designing new churches, whether in towns or in the country, it appears to the writer that it is wise to adopt the happy mean, a not too ornamental exterior, but certainly not ugly, and to reserve for the worshippers in the earthly presence-chamber of the Most High the better part of the ornamentation. In 1870 a semicircular apse was added to Christ Church, and the choir seat arrangement brought forward into the nave. Though galleries exist both at the west end and north and south sides, the building is divided into nave and aisles by piers square in plan, with moulded capitals and bases, carrying semicircular arches, all well executed in wood. The piers stand clear of the galleries. The nave has tie-beams and a semicircular barrel-plastered ceiling. The walls and ceiling are coloured in a harmonious and effective manner, but the angles in the spandrels of the nave arches are not very happily conceived. On the responds of the chancel arch are representations—on the north side, of St. MARY MAGDALENE and other female saints ; on the south, St. STEPHEN, St. GEORGE, and others. Around the lower part of the apse walls are ranged in couples figures of the Apostles, surrounded by an architecturally-painted framework. As the apse windows are also filled with painted glass, the effect of the chancel is rich.

In the *Church of St. Andrew*, Stamford Street, there is no structural division or arch between the nave and chancel, the roof being continuous. But the arcades are rather differently treated ; there are narrower bays to the chancel, and the open roof is much more ornamental. In a very large church it

\* See *Architect*, June 29, 1878.

seems to be better not to adopt such a treatment, but in a smaller building it answers well. The piers to the nave arcade are circular, with small shafts attached to them north and south, carrying part of the arch mouldings, the remainder stopping on the subsidiary piers in "discontinuous" fashion. This is an unusual arrangement, and, if better contrived, would have looked well. It is refreshing to see a slight departure from the regular jog-trot style. Mere eccentricity in architecture for its own sake is to be condemned, but in the hands of a master the occasional wandering from the beaten path often results in the happiest successes. A building bristling with oddities, where each of them appears to be saying, "Come, look at me, I am so funny," is disturbing to the artistic eye, and cannot be said to possess that element of repose which is so essential a thing in true architecture. We do not want severe academicism, or lifelessness, but we do look for some little play of fancy and lifting-out of the commonplace.

The church which is now to be commented upon—*St. Andrew's*, Tavistock Square, formerly Woburn Chapel—may be said to have passed into history, though very recent history; and whatever is said about it must be in the past tense. Unattractive externally, when it was seen by the writer, it was still less so internally as regards the fabric. But it is surprising how much "millinery and upholstery," as some people would say, tend to brighten up and redeem a building ugly in itself. Entering the church one dark Sunday morning in the depth of winter, the interior at first sight seemed almost impressive. On the lightest day it must have looked sombre, there being only windows at the north and south ends (the church was not orientated), and these a considerable distance from the floor. A few small windows existed on the west side, but little light struggled through them. Owing to its darkness and the arrangement of nave and aisles of almost equal height, "groined" in lath and plaster, the church reminded the writer of a Spanish interior. The proportions give the appearance of being lofty, and render it effective. But there is no constructional chancel, as the building is very short and the detail is very bad—of the worst "Carpenter's Gothic." The nearest approach to anything good was the tracery of the rose window to the chancel, which, with a little modification, could have been rendered a good design. There was a plain and very open chancel screen, surmounted by a cross. The altar was considerably raised, with a very lofty super-altar quite 2 feet 6 inches high, and therefore unnecessarily high. Not only were there vases of flowers and candlesticks, but pots containing arums, an unusual adornment in such a place.

Under the before-mentioned rose window and above the super-altar was a large oil-painting, which the darkness made undecipherable. Over the window was a painted vesica, containing our Lord in Majesty, with adoring angels kneeling, and below on either side an angel standing. There were two lecterns on either side of the chancel screen doorway, hung with lace frontals; and here was read not only the lessons, but the gospel and epistle. The *raison d'être* of such a practice did not exist in this building, whereas in a very long and large church it is suitable. From the foregoing remarks it can be guessed that the ritual was "advanced," and it can cause no surprise to learn that a couple of acolytes were attached to each officiating clergyman, whenever he had in the course of the service to shift his place. A fatal bar, however, to all correct ritual arrangements was the fact that there was no central processional path or passage, as seats extended over the middle of the church. The absence of such a passage is always a subject of regret where ritual is carried out.

The fine and carefully-studied *Church of St. John the Evangelist*, Red Lion Square, so wonderfully different from the last named, shows all the characteristics of its gifted architect, Mr. PEARSON, exhibiting his refinement and happy appreciation of scale and proportion, together with his great delicacy in detail and moulding carried almost to a fault. To speak first of the exterior, there are majestic turrets—in fact, almost towers—flanking the east end of the chancel, polygonal in plan instead of being square, as are those in a similar position at *St. Augustine's*, Kilburn. The composition of the upper portion, with the little buttresses projecting at the sides of the turret between the cardinal points, is elegant. Unlike the *St. Augustine's* examples, which are covered with lead, these are crowned with stone-weathered courses, the plan at this point being circular, giving rather a heavy appearance. The pseudo-porch under the future tower is an excellent com-

position, with its gable, &c.; but it is rather to be regretted that some figure sculpture was not used here instead of so much arcaded work. A little sculpture at times gives wonderful life, interest, and variety to architectural work, which no amount of other ornament can afford. The clergy-house on the north side of the church being built flush with the east end somewhat interferes with the proportion of the chancel. It is a pity the north side does not stand clear. However, in London the exigencies of space are great, and one ought to be thankful that the remarkably irregular and awkward site has been so skilfully manœuvred by a subtle hand, so that its very blemishes have given birth to beauties. In fact, the mediæval spirit has inspired the architect, and thus uncouth angles have been cunningly coaxd by means of groining, &c. The beautiful morning chapel shows this in a conspicuous degree. The plan of the wide nave and narrow chancel reminds one of the splendid cathedral of Gerona, Spain, though of course the scale of that is infinitely greater. This noble church fitly adorns a commonplace London square by no means remarkable for its beauty. A great deal more might be said about this interesting structure, but so much has been already written about it elsewhere, that it is unnecessary to comment further on its details.

(To be continued.)

#### MR. DENMAN TRIPP'S GALLERY.

MR. DENMAN TRIPP has selected a central situation for his gallery, which occupies the angle of the Rue de Provence and the Rue Lafayette. The fête which inaugurated its opening was attended by M. ANTONIN PROUST, Ministre des Beaux-Arts, as well as by most of the notabilities of the art world. The object which Mr. TRIPP had in view has been admirably carried out. He conceived that a place of rendezvous where the *cognoscenti* could in perfect seclusion study the works of masters of which they wished to possess examples was needed; as also where they could transact business connected with art, obtain the address of artists with whom they wished to be in communication, and also where students arriving from England, ignorant of where to find the masters of special schools, could acquire information with regard to these, hear where models were to be studied, and generally obtain *renseignements* connected with their profession. Neither study, taste, nor expense has been spared to accomplish these ends. The galleries contain the most perfect examples of TROYON, COROT, MILLET, DIAZ, and the whole of the French school of the last half century which it is possible to bring into the market. ALEXANDRE DUMAS fils paid 500*l.* some years ago for a COROT, which it was his pride to point out to his artist friends as one of the finest of that master's works. By a strange accident the picture proves to have been painted by one TROUILLEVERT, who has so perfectly caught the trick of COROT's manner as to have gained his livelihood for years past by selling landscapes to picture dealers, for small sums, from which they have effaced his signature and superposed the five magic letters of the name which turns to gold a few inches of canvas otherwise not valued at as many sous. The peculiar luxury of enjoying pictures hung at a distance one from the other, in a perfectly lighted and, let us add *en passant*, exquisitely decorated *salle*, is rarely granted to us in Paris, where every centimètre of space is of infinite value. To the examples of dead masters are added specimens of the two LELOIRS (LOUIS and MAURICE), of LUMINAIS, of DE NITHS, of TOFANO, of DÉTAILLE, *e tutti quanti*. The gallery on the first floor must be inspected in order to get some idea of the artistic arrangement and refined taste with which it has been decorated. In the upper galleries is a rare collection of the engravings of the eighteenth century. To resume our idea of Mr. TRIPP's gallery, let us remark that his house is a charming home, where, as at an art club, none but the *élite* of the art world are admitted, and where specimens of various schools can be studied in all the retirement of the private home of a millionaire, to whom space, light, and luxury are the necessities of everyday life. Among the works now exhibited are FLAMENG's *Jean Bart à Versailles chez Louis XIV.*, which immortalises the famous scene where the gallant old admiral, more at home on a quarter-deck than in the perfumed chambers of the great, quietly lights his pipe while recounting his last victory to the Grand Monarque; the splendid portrait of

a woman by LEHMANN, which attracted so much attention at the Salon of this season; CLAIRIN'S *Intérieur d'un marchand au Caire*, two companion pictures by MOSLER, entitled *Les Fraises* and *Echanges de bons Procédés*; an episode of the siege of Paris by RICHEMONT, &c.

## THE ENGINEERING EXHIBITION.—II.

IRON is hardly a metal that the casual observer would pronounce to be capable of adaptation to purposes of ornament. Other metals are in themselves more sightly, they are more easily worked, and lend themselves more readily to artistic purposes. Nobody acquainted with art but knows, however, that the most beautiful and artistic of works have been wrought by the smith, and that admiration for the art of the blacksmith is in no degree second to the artist's appreciation for the daintiest work of the gold or silversmith. Old mediæval examples, for instance, here and abroad, whether still *in situ* or treasured up as relics of art, are proof of the lovely and delicate work that can be produced by masters in the craft. Thus it was a pleasure to see work such as that shown by Messrs. W. H. LINDSAY & Co. (Paddington Ironworks, Wharf Road), testifying to the excellent modern work done by the firm, samples of ornamental ironwork for churches, mansions, business premises, and mediæval ironwork being shown. Work in hammered wrought iron is beautifully represented by a thistle and bunch of roses. We can quite understand that the rose-bunch, as a matter of cost, is worth its weight in silver. It represents a spray plucked from a rose-bush, with rose and bud clustered in delicate leafage. In execution and finish it would be hard to match, let alone whether many firms would essay to do so. In the same category must be mentioned the excellent example of a panel for a door, likewise of hammered wrought iron. Other work shown includes details of gates, panelling, railing, staircase balusters, &c., of mediæval design; and as the firm undertake to carry out any designs required, architects need have no difficulty in seeking a firm to whom they may entrust the carrying out of their designs. We understand, too, that the firm are at present executing large contracts for balusters in some West End houses.

Among the exhibits of Messrs. ROBERT BOYLE & SON, of the Holborn Viaduct, and Glasgow, is shown the heating and ventilating apparatus, a full description of which appeared in *The Architect* of June 23. There is also a model of the firm's concentric tubes for drawing off the heats and products from combustion of gas, models of the complete economical system of ventilation for workmen's cottages, and plan of the system of ventilation and sanitation for dwelling-houses. The various specialities of this firm in the way of ventilators are also shown for churches, schools, halls, and other public buildings, for private mansions, hospitals, infirmaries, warehouses, workshops, and especially for ships, for the ventilation of which this firm received the 50<sup>th</sup> prize and gold medal.

The "Pennycook" Patent Glazing and Engineering Company, Limited, of Glasgow, and 57 Chancery Lane, show as a model, the section of a roof illustrating their patent method of glazing without putty. The advantages claimed for the patent are great light space, the sash bars being small in section, and the purlins far apart; no breakage of panes from expansion, contraction, or vibration; no screws, or other fastenings, to remove when replacing broken panes; no skilled labour required to replace broken panes; no drip from water condensed on the inner surface of the glass; saving in maintenance and repair; no painting required; wind and water-tightness, &c.; and that the sash-bars being self-supporting and complete, the expense of wooden or iron bars, when putty and other systems are used, is dispensed with. Among the architects for whom the firm have executed works are Mr. E. C. ROBINS, F.S.A., Mr. WATERHOUSE, A.R.A., Mr. JOHN HONEYMAN, of Glasgow, Mr. A. G. THOMSON, and Mr. A. MYLES, also of Glasgow. The highest award in the shape of a silver medal was awarded to the company at the Wirral and Birkenhead Agricultural Societies' Exhibition last year.

Messrs. SAMUEL OWENS & Co., of Whitefriars Street, Fleet Street, E.C., exhibit varieties of pumps, BLAKE'S patent direct-acting steam pumps, single, double, and treble-barrel well pumps, pumps in frames, single and double portable force pumps, irrigators, fire-engines, &c.; also hydraulic rams, hydraulic jacks, the Cassiobury fire extinguisher, &c. There

is a model of LACOUR'S patent, direct-acting, steam pile-driver. Patented in France, November 1876, up to the present time nearly 100 of these machines, provided with monkeys ranging in weight from 6 to 30 hundredweight, have been supplied to Government departments and contractors in France, Great Britain, and on the Continent. The advantages claimed for the patent are, that a rapid delivery of a number of strokes by a heavy monkey, with a moderate fall, giving a steadier and more even blow than when these conditions are reversed, as in the case of the ordinary pile-drivers—except in the Nasmyth machine, the immense cost of which renders its employment almost prohibitory. That the height of the fall and the number of blows delivered in a given time can be regulated with ease; and the monkey may be operated by hand or arranged to work automatically. That any existing pile-engine can be fitted with LACOUR'S steam-monkey, and the necessary steam may be taken from the boiler of an ordinary portable engine. And that the machine will do a greater amount of work in a more effective manner than any hitherto made, whilst its first cost and expenses of maintenance are far less than those of any other steam pile-driver. Mr. JOHN WADDELL, of Edinburgh, the contractor for the new Putney bridge, is employing three of these machines, which is very good proof of their efficiency.

The hydraulic ram is an improved, self-acting apparatus, to raise and supply water at any reasonable height or distance, without cost for labour or motive power, to public or private establishments, farm buildings, railway stations, &c. All that is requisite is to obtain a few feet of fall from the source whence the water is to be raised, which may be a brook or spring, lake or pond, &c. The apparatus works night and day, and needs but slight attention, and the cost of the apparatus is moderate. The Cassiobury fire-extinguisher, as designed by Messrs. OWENS for the Earl of ESSEX, is also shown. To the effective service of this apparatus the Earl has acknowledged that he owes the preservation of his house from total destruction by fire.

The well-known Archimedian screw ventilator of Mr. JAMES HOWORTH, 147 Queen Victoria Street, is shown by the Machinery and Hardware Company, Limited, as also Messrs. WINN & Co.'s double-action "Waterfall" pump, specially designed for irrigation works; Mr. H. L. MÜLLER'S "Alpha" patent portable gas-making machine, and a GILLINGHAM patent radiator; also a one-horse power patent vertical gas-engine of Messrs. S. CLAYTON & Co.

The valuable specialities of Messrs. EDGAR ALDOUS & SON, 18 Queen's Road, Peckham, were lately referred to when exhibited at the exhibition of the National Health Society. Messrs. ALDOUS now show their ventilating and exhaust systems as adapted for shipping purposes, and to these we may allude as illustrative of what the system may be expected to do when applied to houses, &c. The recommendations claimed for the hot and foul-air extractor are, among others, that it has no equal for extracting gas or vitiated air, and is proof against down-draught, and, being entirely self-acting, it can be applied to any class of ship, whether steam or sailing. It can be placed on deck or over skylights, and, by means of tubes connected with the bottom, conveyed to any part of the ship. At least four or six distinct ventilators can be constructed without interfering with the action of the exhaust; for instance, a moderate size tube in coal bunkers will effectually discharge the inflammable gas as generated "with disastrous consequences, where spontaneous combustion and explosions frequently result from inadequate ventilation," and so make the exhaust a ventilating shaft. By so doing it will act in a double capacity—first, by discharging gas or steam which may be conveyed into it from any part of the ship by means of pipes—secondly, there being a very strong suction it will of itself extract gas and steam independent of any pipes connected thereto. The ventiduct, or intake, is constructed upon the same principle as the exhaust, with a concentrating and concentric tube. The head receives the wind from any point of the compass, it is then carried down the concentrating tube into the concentric shaft, and thus forming a column. By means of a cone it is split up and carried into an octagonal chamber; this chamber is divided into eight separate compartments—by this means it will throw out a circle of fresh air in the form of a disc at least from four to five feet diameter, and no direct down-draught is felt. To each of the compartments in the octagonal chamber can be fixed a tube carried to any part of the ship, and so take its own proportion

of fresh air; the air in the tube again forms a column; it can then be divided as in the first octagonal chamber, and can be multiplied eight times, or less, as may be required. Although the exhaust and the ventiduct have no connection one with the other, the action of the ventiduct materially assists the exhaust, that is to say, the fresh air comes in and drives the vitiated air out.

Messrs. SALMON, BARNES & Co., Ulverston, Lancashire, and 7 Victoria Street, Westminster, show in action an A B C patent self-sustaining hand-power lift with balanced friction gearing and automatic brake. The lift exhibited was loaded with several weights, amounting in all to 56 lbs. It is so easily set in motion that a child might work it, the starting or stoppage being to all intents and purposes instantaneous when the hand is applied or withdrawn. In case of overloading the lift, the greater the weight (within limits) the more effective the brake becomes. A notable point is found in connection with the friction gearing, an improved form used without tooth-wheels, and so arranged that the wheels are kept in gear by the pressure of the weight of the cage, balance weight and load, and with an increased load there is an increased grip upon the gearing, which under all ordinary and safe conditions is sufficient to convey the power to the load without slipping, besides which any sudden strain, such as a jerk, from a jam of the cage or balance weight, or sudden release from a momentary jam, the friction gear would slip and no breakage would ensue. The speciality is quite new, and the fact that the firm are booking orders is a guarantee of what is claimed for it, namely, cheapness, simplicity, ease in manipulation and fitting up, combined with safety. A working model of the patent mining and deep well double-action balanced pumps is shown. In this pump the ordinary pump rods are replaced by tubular rods, which form the rising mains to convey the water to the surface, so that a fixed rising main is not required, thus effecting a saving in first cost of pumping plant. These pumps are double-acting and balanced, and with spring and atmospheric cushion, the columns of water are kept in motion without shock or strain, or loss of power. The firm also exhibit specimens of revolving shutters, iron and wood, and a new wood revolving shutter, moulded on both sides; each side being identical in appearance, a capital division is formed for school purposes, for which it is, among other uses, employed. It has been adopted at the Acton Priory School, among other places that could be mentioned.

Messrs. HAYWARD BROTHERS & ECKSTEIN, Union Street, Borough, have on exhibition their patent "semi-prism" ships' deck lights for securing a maximum transmission of light through decks into saloons, cabins, gangways, stores, &c. One side of the lens is nearly upright, and the other inclined at an angle, so that the light passing through the upper surface shall strike the inclined side, be reflected within the lens, and issue from the upright side in the required direction.

Mr. R. ADAMS, 7 Great Dover Street, Borough, has on view his fanlights opened by patent apparatus, patent compensation spring hinges with adjustable shoe-top centre, reversible, the patent safety windows, thief-proof casement bolts, fasteners, spring hinges, &c., and other specialities. These have been noticed lately in *The Architect*.

Mr. CHARLES D. PHILLIPS, Emlyn Works, Newport, Mon., shows samples of his patent lock-jaw roofing tiles in an improved form, lapping with a double groove or grip. The single-grip and double-grip tiles are red, dun, or glazed, as required. They form a roof impervious to wind, wet, and snow. When adjusted on a roof each tile locks into and forms a groove, and tenon joint with its fellows on each of its four sides, so that nothing can penetrate, and as each tile in process of manufacture undergoes a pressure of forty tons, they are practically non-porous. The improved hip cover of Mr. PHILLIPS is specially designed to fit any pitch of roof. These covers fit course by course with the tiles, and the ends are coved in, and when laid leave no mortar or cement visible. Also are exhibited drilling machines, planing machines, saw bench, lathe, and other machinery, shafting, leather beltings, &c.

**The Annual Excursion of the Shropshire Archæological Society** took place last week to the district around Lydbury North, including a visit to Walcot, the Shropshire seat of the Earl of Powis, the ancient seat of the Plowden family at Plowden, and the famous ancient British encampment known as the Bury Ditches on Tangle Hill, near Walcot.

## PARIS NOTES.

M. CAMESCASSE, the Prefect of Police, has demanded and obtained from the Municipal Council the necessary funds for the creation of a special service for the sanitary inspection of all kinds of lodging-houses, which number not less than 10,000 in Paris, and present in many respects, if not well looked after, a real danger for the public health. The staff of inspectors, who are to enter upon their duties on the 1st of next month, comprises five architects at a salary of 3,000 frs., four assistants at 1,500 frs., and two clerks.

The colossal statue of *Liberty*, destined to serve as a lighthouse for the port of New York, is now rapidly advancing towards completion. The body, in fact, is almost finished, and preparations are being made for placing the head, which, it may be remembered, figured at the 1878 Exhibition. It has been arranged that Bartholdi's great work shall be erected provisionally in the Parc de Montsouris, previous to being sent across the Atlantic.

The Minister of Fine Arts has decided that France shall be represented at the exhibition of the graphic arts which is shortly to open at Vienna. This exhibition is intended to be a retrospective one, showing the progress made in the art of reproduction during the last fifty years. The French exhibits will comprise specimens of the engravings executed by order of the Louvre management, of those made under the control of the Administration of Fine Arts, and last, but by no means least, of the work of private artists produced since the year 1833.

The French Archæological Society will this year hold its fifth annual congress at Caen, between the 16th and 21st of the present month. Several visits to spots of archæological interest in Caen and the neighbourhood will be made, and the council of the Society invite archæologists of all countries to attend.

The committee formed for the purpose of preserving the remains of the Arènes de Lutèce, lately discovered in the Rue Monge, has elected M. Victor Hugo as its honorary president, M. Henri Martin, senator, as president, and MM. Duruy, Clémenceau, Laurent Pichat, deputies, and M. Renier, of the Institute, as vice-presidents. The committee has decided to demand permission from the Government to organise a lottery for the purpose of raising the necessary funds to purchase the site and lay it out as a public garden.

For some time past it has been apparent that the effect of the new causeway, built to connect the celebrated Mont St. Michel with the shore at all states of the tide, and only completed about two years ago, has been to cause the violent currents that prevail there, and which formerly had free course round the island, to eat into and undermine the cliffs of the Mount, and so endanger the precious buildings it contains. These are classed as historical monuments, and as the departments of Public Works and Fine Arts, whom it jointly concerns, could not agree as to the best steps to be taken to put a stop to these ravages of the sea, the Prime Minister, a fortnight ago, named a special committee, consisting of M. Durand, Under-Secretary of State, Messrs. Antonin Proust, Casimir-Perier, Morel, and Roger-Marvoise, to proceed to Saint Michel and examine the question on the spot. The report of this body recommends the adoption of the following measures: (1) To change the direction of the causeway at a distance of a quarter of a mile from the Mount, so that the end of it may rest on the rocks between the entrance gate and the orphanage, the necessary measures being taken to connect this new terminus of the causeway with the entrance gate; (2) to undertake the necessary works to prevent all silting or deposit by the sea along the coast for a distance of 1,100 yards on each side of the Mount; and (3) to undertake immediately the repairs that have lately become urgent to the ramparts of St. Michel. It is intended to bring the matter before the Chambers at once, and demand the necessary credits for carrying out the recommendations of the committee.

It has been decided to erect new buildings for the Ecole des Chartes on a plot of ground to be detached from the Luxembourg. This school is at present an annexe to the National Archives, but it is very much cramped for room, and the keepers of the archives will be glad of the space it occupies in their building for the storing of many important documents and interesting collections now relegated to the garrets. The new school will cover an area of 6,000 to 7,000 square metres.

The death is announced of M. Edouard Fleury, a distinguished archæologist and the elder brother of M. Jules Champfleury, Con-

servator of the Sèvres Museum. M. Fleury, who died at the age of 68, was the author of a "History of the 1814 Invasion of the North-Eastern Departments of France," and several archæological works.

A young architect, M. Paul Huchet, while occupied on Monday last in examining the roof, gutters, &c., of a five-storey house in the Rue Lafayette, made a false step and falling was killed on the spot.

## BIRMINGHAM ARCHITECTURAL ASSOCIATION.

THE annual dinner of the Birmingham Architectural Association took place at the Grand Hotel on Thursday evening last week, the president, Mr. J. J. Bateman, in the chair; the vice-chair being occupied by Mr. W. H. Kendrick. Amongst those present were the Mayor of Birmingham (Alderman White), Councillor S. Edwards, W. S. Till (borough surveyor), — Earpes (borough surveyor), West Bromwich; W. Henman, J. P. Osborne, E. Wood, F. G. Hughes, V. Scruton, F. E. F. Bailey, Norman Gething, Franklin Cross (hon. sec.), and others. After dinner and the usual loyal toasts, Mr. King James gave "The Profession."

Mr. W. Henman, in responding to the toast, said that in the provinces there appeared to be a want of that feeling of brotherhood which was noticeable in the metropolis. It might be in consequence of the want of means of meeting together, but he was unable of course to say. He was pleased to know that the Architectural Association was doing a good work towards bringing about an improvement in that respect. It brought together the younger members of the profession, but the older members never seemed to meet. There was no profession which did more, if properly carried out, for the health, comfort, and happiness of mankind in general than that of the architect. It had lately been said by Dr. Foster that the medical profession should be better represented in Parliament than it was; but he thought he was correct in stating that they had not a single representative in the House of Commons. He should like to see some of their leading architects with a seat in that august assembly.

The Chairman proposed "The Association," and said he should like to refer to what was a grave question in his mind, and one upon which the profession seemed to be impotent. It was with regard to the fearful devastation of buildings by fire. If ever there was a time when fireproof constructions were needed, it was at the present moment. They were horror-struck by the devastation of invaluable art treasure which had taken place lately, and which, by due forethought, might, in all probability, have been preserved. He did not think they could lend very much help in buildings already erected, because there were so many thousand hidden sources of conflagration. It would be impossible to attempt any reconstruction with anything like satisfactory results. All that they could do was to organise chemical appliances for the prevention of the spread of fire whenever it might occur. It was important to consider the question of new erections. They did not seem to have taken due cognisance of the numberless warnings which were occurring almost every month. A most stringent building Act should help them to isolate and give substantial reality to every building, but they wanted an internal construction which should resist the ordinary action of fire. That would never in his opinion be accomplished to the satisfaction of the public until the cost of fireproof construction was so minimised as to enable an ordinary builder to do the work. There was no doubt, in the construction of theatres, rooms for public assembly, or buildings where large numbers of persons congregated, that the very great difficulty with which they had to contend was not perhaps so much the fireproof character of the building as the question of panic. The question of "panic" was an important one. He did not think that any buildings should be licensed by the authorities unless there were ample means of exit. He did not mean wide doors, where people could be thrown out, but an exit which would be effectual for the purpose of emptying a theatre in a reasonable space of time. If he were allowed to suggest the class of building that appeared to be the most suitable, he should say that all buildings should be surrounded with what he would call a fireproof shell, into which from every level all the auditory could enter the corridors, which should be perfectly safe. In illustration of what he meant, he would mention the Albert Hall, in which there was accommodation of this kind. This was a subject which should form the subject of their future study. He should be pleased to place at the disposal of the association a prize of 5*l.* 5*s.*, to be paid for the contribution of the best essay on fireproof construction, architecturally illustrated. In his opinion terra-cotta was the coming material for the external work of their buildings, and for the reason that it was as nearly indestructible as possible. Their difficulty hitherto had been more particularly in its manufacture. Its manufacture, however, had now been greatly improved.

Mr. W. H. Kendrick acknowledged the compliment, and gave a *résumé* of the progress of the association during the twelve months.

In replying to the toast of "The Mayor and Corporation,"

which was proposed by the chairman, his worship said that when he came to Birmingham thirty-five years ago, he thought that it was an ugly and uninviting town as far as its exterior was concerned. In the past few years, however, they had redeemed the past as regarded the meanness and shabbiness of the buildings. It was no longer the hardware village, but the great Midland metropolis. Birmingham now took high rank amongst the great cities of the empire. He was glad that they were living down the age of ugliness.

The other toasts were "The Visitors," proposed by the chairman, and responded to by Mr. S. Edwards; "The Retiring Officers," proposed by Mr. F. E. F. Bailey, and responded to by the secretary; "The Allied Arts," submitted by Mr. N. Gething, and acknowledged by Mr. J. W. Tonks; and the "Honorary Members," proposed by Mr. Scruton, and responded to by Mr. F. F. Proud. During the evening several songs and recitations were given by the members and visitors. Mr. C. A. Harrison, a gentleman unconnected with the profession, during the delivery of an eloquent speech generously offered to place at the disposal of the committee the sum of 10*l.* 10*s.* to be devoted to a prize for the best essay on "The Ventilation of Buildings."

At the last ordinary meeting the following members were chosen as officers for session 1883-84: President, Mr. J. J. Bateman; vice-president, Mr. W. H. Kendrick; hon. secretary, Mr. F. W. Franklin Cross; hon. treasurer, Mr. A. Reading; hon. librarian, Mr. Norman Gething; ordinary members of committee, Messrs. O. Essex, F. G. Hughes, W. G. Mantel, V. Scruton, F. Simon, H. Rayner, and E. Wood; auditors, A. Hale and T. W. F. Newton.

## PROPOSED RAILWAY BRIDGE ACROSS THE CHANNEL.

A BILL brought forward by M. Achard, the object of which is to obtain powers to make soundings preparatory to the construction of a railway bridge over the English Channel from Cape Grisnez to Folkestone, was distributed in Paris on Monday to the members of the Chamber of Deputies. It provides that the control of the soundings already taken, and of those which are to be made, at distances of fifty mètres apart, shall be in the hands of hydrographical engineers. The preamble of the Bill states that the promoters of the scheme only ask from the State this verification and control of the soundings in order to accurately determine the nature and consistence of the bottom of the sea and the depth of the water along the line proposed to be followed, and that they claim neither a subvention nor a guarantee of interest. The preamble points out that the success of the enterprise would prevent the diversion of the routes of transit from India and the East, and would create between France and England a veritable bond of union and a policy of mutual cordial agreement.

## THE ARCHITECTURE OF LEDBURY CHURCH.

AT the meeting of the Woolhope Naturalists' Field Club, held recently, the Rev. J. Jackson, M.A., rector, remarked that ecclesiastical architecture must always be regarded with peculiar interest. A thoughtful mind cannot but experience melancholy feeling on beholding the barbarous mutilations and additions to which the Gothic piles of the Middle Ages have been subjected, which nevertheless still retain a holy and venerable character, appearing through the land like monuments reared to bear testimony to the genius and piety of our forefathers. Whether any remains exist of a church at Ledbury earlier than the Conquest is doubtful; but if there be, the only fragment is the hagioscope on the north side of the chancel, which, until about six years ago, was blocked up with stone walling, plastered over and hid from sight. The rudely-constructed arch, built of stone from a neighbouring quarry, might lead to the conclusion that it was Saxon work; but on this point various opinions have been given. I am in some degree confirmed in my opinion that this is of pre-Norman date, from the fact that on the north side of the hagioscope, in what is known as St. Mary's Chantry Chapel, a Norman piscina was introduced without interfering with the hagioscope on the south side of the wall. Shortly after the Conquest, a Norman church existed of the length of the present one—viz., nave 97 feet, and chancel 90 feet, with side aisles of narrow width, and chantry chapels at the east end of those aisles, with their altars, aumbries, and piscinas, the latter of which are still remaining. The Norman doorway, with its rich mouldings, not unlike in character to the chancel arch of Kilpeck Church, the outline of two Norman windows, and the Norman buttresses with their conical heads show this at the west end, and the Norman arches of the chancel, the remains of two Norman windows, the two perfect ones in the north and south walls, and the buttresses at the east end, show unmistakably that such church existed.

All traces of Norman work in the east wall have disappeared,

and a perpendicular window has taken the place of the Norman. An examination of the outside of the west end of the south aisle shows the foundation of an aisle about eight feet in width, similar to the south aisle of the Priory Church of Great Malvern, and the drip-stone in the north and south walls of the chancel, underneath the circular clerestory windows, show that those windows during the existence of that church were in the outer walls of the building. In the north aisle is a Norman pillar and capital, from which sprung the arch which separated the aisle from the chantry chapel, and at the west end of the drip-stone on the north side of the chapel is a portion of stone cut out at an angle, which shows the pitch of the roof of that aisle and chapel, which was evidently what is called a "lean to" roof. From the grotesque carving of that date (forming, no doubt, some of the corbels) which has been fortunately preserved and inserted in the eastern ends of the north and south arcades, there is sufficient to show that the Norman church was of no mean pretensions. The pillars of the Norman arches on the north and south sides of the chancel, square to a certain height, and then circular, are singular specimens of Norman architecture. The chapels on the north and south sides would appear to have had a stone screen to separate them from the chancel, for on the east end of the walls, under the capitals, are stones with mouldings, which have formed one side of doorways to communicate with the chapels and chancel. The chancel arch is one of the obtuse pointed or drop arches, which are occasionally found in Norman work of the latter part of the twelfth century. The peculiarity thereof is that the east and west sides do not correspond in their character and mouldings.

The next important change which we find is the removal of the Norman side aisles. In the early part of the thirteenth century, when the Early English style of architecture changed the form of the windows, and elongated ones with tracery took the place of the Norman, the principal portion of the south aisle was built of a greater width than its predecessor, and appears to have been built at three different periods, the easternmost part (known as St. Anne's Chapel), as appears from a straight joint in the wall, with its three windows and doorway, being the most ancient; then the aisle, with its four windows to another straight joint in the wall, where it probably ended. From that point westward a totally different style prevails, in the formation of the buttresses, string-course and inner mouldings of the window jambs, the concave being changed to convex in the heads of the south-west and west windows. At a later period, while the Early English style prevailed, the north aisle was built with its beautiful tall windows at the east and west ends. The porch appears to have been added about that period, as the same character prevails in the outer arch, in the arch of the doorway, and the windows of the north side of the aisle, which have this peculiarity, that the heads are not curved to merge gradually into the jambs, but spring from a point, and the heads take a shape approximating to an equilateral triangle. In the porch is a lower chamber formerly connected by a staircase with two upper chambers for the use of the sacristan. One of them has a fireplace and piscina of Early English date. The proportions of the rooms have, however, been entirely destroyed by a fine specimen (I hope the last of its kind) of what is called "churchwarden's architecture," when, about thirty years ago, the ceiling of the lower chamber was raised, thereby interfering with the windows of the upper chamber, as well as with one, or it may be a doorway, in the north wall of the church.

Up to this date the north and south arcades of the nave remained in their Norman shape. In the early part of the fourteenth century, when the Decorated style was introduced, the south arcade was taken down, and the present pillars and arches were built, corresponding in form and moulding with those at Sandhurst church, in Kent—viz. a plane octagonal pier, with a simple capital and moulded abacus. A few years ago, when, in consequence of their deflection from the perpendicular, two of the present arches were taken down and rebuilt, several Norman corbels like to those still remaining in the south wall of the chancel, and portions of circular clerestory windows were found in the walls between the arches. At the same period, when the ball-flower, the ornament most peculiarly characteristic of the Decorated style of Gothic architecture, prevailed, the beautiful chapel, known as St. Catherine's, at the north side of the north aisle, was built. The wall was pierced, and an archway was made to connect the aisle and chapel; the original window over the archway was shortened, and left as it appears at present, but, until a few years ago, it was walled up and plastered over.

The last change which took place in the architecture of the church was the substitution of the present north arcade for the Norman, in the year 1619, as appears by a date on the wall-plate of the roof. The meagre capitals, with the lozenge-shaped pillars, show that Gothic architecture was then on the decline. The workmen who built those arches and pillars appear to have had one of two motives for their work, either to be at as little trouble as possible, or to preserve all that remained of the Norman arcade, for in the easternmost pillar some portion of the moulding of a Norman capital is visible, and in the four westernmost arches the Norman hood-mouldings were used, which give them their irregular and zigzag appearance, while the two easternmost arches have mouldings of a different character. The tower is and always

has been separated from the church. The lower part thereof, up to and including the lower tier of the windows, is of strictly Early English character. The original tower was surmounted by a shingle spire placed thereon without battlements. In the year 1725, October 10, the following resolution appears in the churchwardens' books: "Resolved, that the steeple shall be taken down as conveniently as it can, it being so much out of order that it cannot be repaired;" and in the year 1727, July 14, an agreement was made with — Wilkinson, mason (who built the Worcester spire), "for the new erecting a stone spire of hundred feet in height" above the present stonework. The tower was raised one storey, in which the bells were re-hung, and the present spire was built, a passable work considering the time of its erection, though the Corinthian cornice underneath the battlements, and the upper windows in the tower, ill accord with the graceful outline of the Early English windows and doorway beneath. The height of the tower and spire is 202 feet.

In the year 1771, the mutilation of the timber roofs commenced. No doubt the men of that generation were so well pleased with their performance that the north and south aisles were also "seeded," and in carrying out this unfortunate work, the mouldings on the timbers and wall-plates and the stone cornices were recklessly destroyed. These ceilings have disappeared, and the original roofs are again brought to light.

The roof of the south aisle, constructed entirely of English oak of massive dimensions, is an exact restitution of the original. On its being repaired, a few years ago, every feature of the old roof was retained. I have little doubt that the settling of the south wall from the perpendicular took place immediately after it was built; as it was found on careful examination and measurement of the principals of the roof, that they had been fitted to the expanded form of the walls. The panelled roof of St. Anne's Chapel at the east end of the aisle, is an exact copy of the original, all old work being carefully retained. The roof of the north aisle is similar in character and detail to that of the south aisle. The roof of the nave is waggon-shaped, and of much later date. All the roofs of the Early English character were of very high pitch. Towards the end of the fifteenth century they became much lower. Unfortunately the roofs of this church are placed on walls of a much earlier date, and consequently in the nave and north aisle they interfere with the heads of the windows.

Attention may be called to the glass sun-dial in one of the windows of the south aisle. There are not many of the kind in existence. They are curious, but not altogether to be depended upon for their accuracy in denoting time, as the surface is affected by the action of the wind. The painted glass in the tracery of the east window, some figures in the north window of the chancel, some fragments in the window over the door of St. Catherine's Chapel, which have been collected from other parts of the church and reglazed, is all that is worthy of notice. The other painted or stained glass is of a modern and inferior character.

## NEW THEATRE AT EASTBOURNE.

At a special meeting held on Thursday, last week, of the building committee, the members proceeded to the new theatre premises, now nearly complete, in Seaside Road, for the purpose of making an inspection. Mr. F. W. H. Cavendish, Mr. Charles Adams, Mr. Simmons, Mr. Luck, and other members of the Local Board were present, as were also Mr. F. W. Schmidt and Mr. Tomes, surveyors.

Mr. Schmidt explained to the committee the plans of the shops as passed at a previous meeting of the Board, and pointed out that it was a clear contravention of the by-laws to so arrange the theatre premises that portions of the shops incorporated should be used as private dwellings. It was contended that no adequate space had been left by the architect—Mr. Phipps—such as would justify the use of any of the upper rooms as dwellings, and that the plans, as passed by the Board, never contemplated such dwellings.

Mr. Simmons and others, on the part of the representatives of the theatre, maintained a contrary view of the question, pointing out the vast size of the frontage and the upper storeys of the new theatre.

After a considerable time had been spent in the inspection of the building, the committee agreed with the building surveyor that it would be a direct contravention of the by-laws to allow dwellings, other than the shops for business purposes only, in connection with the new theatre.

**A Sumptuous Travelling Car.**—The Central Hudson Company have just completed, for the use of Mr. W. K. Vanderbilt, the finest and most complete car which has yet been constructed. It has been prepared from plans by Mr. Vanderbilt at a cost of 5,000*l*. The body of the car is 60 feet long and 9 feet 8 inches in width. The interior is entirely finished in carved mahogany. It contains sleeping berths and bedrooms, with toilet and bath-rooms, dining-room, kitchen, &c.

## NOTES AND COMMENTS.

"OLIVER MADOX BROWN," a biographical sketch, by JOHN H. INGRAM, has been just published by Mr. ELLIOT STOCK, 62 Paternoster Row, E.C. To those who want to read of the precocity of his genius, and know something of the charm of so short a life, this work will be most interesting.

THE second edition of "Lambeth Palace and its Associations," by J. CAVE-BROWNE, M.A., is now ready (W. BLACKWOOD & SONS). As the first edition was only issued in November of last year, it speaks well for the work that a new edition is now before the public. It is a coincidence that the first edition was dedicated to Mrs. TAIT, and the preface written by Archbishop TAIT, whilst the second edition is dedicated in sorrow to the memory of Archbishop TAIT himself.

THE Kent Archæological Society will hold its annual summer meeting at Ashford on the first and second days of August. In course of the proceedings of the first day the Old Grammar School, Hinxhill Church, Brook Church, Boughton Aluph Church, and Kennington Church will be visited, and in the evening papers will be read on the "Early History of Ashford," by Mr. ROBERT FURLEY; on "Heraldry with Architecture and Art," by Canon R. C. JENKINS; and on the "Characteristics of Kentish Churches," by Mr. LOFTUS BROCK. On the second day visits will be made to Ashford Church, Eastwell Church, Westwell Church, Charing Church and the remains of the Archbishop's house, Newland Chapel, Little Chart Church, and Pluckley Church.

THE Rector of Chester-le-Street Church, the Rev. W. O. BLUNT, records the discovery of several old Saxon stones in his church, and describes the latest one discovered as the shaft of a cross bearing a figure of a man on horseback, with a Pictish shield on his left arm; above him are the heads of two dragons, and cut on their necks, which probably are intended to interlace with each other, is the name EADMUND, undoubtedly that of the Saxon king who is recorded to have stopped at the cathedral in this place on his way to fight against the Scots, and to have made rich presents to the shrine. But the peculiar part of the inscribed name is that the M and N are in Runic characters, the rest of the letters being the ordinary Roman type.

WE lately commented on the supposed connection of CHAUCER with Woodstock, the evidence of which rests only on poetical allusions and local tradition. On occasion of a visit paid by the Birmingham Midland Institute to Kenilworth Castle, on Saturday last, Mr. HOWARD S. PEARSON, who gave an address on the history of the castle, argued that CHAUCER and SHAKESPEARE must have visited the castle, a supposition which he based on an apparent allusion in the "Midsummer Night's Dream" to the festivities which took place when Queen ELIZABETH visited the Earl of LEICESTER. The argument no doubt is ingenious, but is hardly evidence of the fact, though it may tend to found a local tradition, or even history.

It is questionable how far technical knowledge on the part of a judge is advantageous to the suitor. A judge who is specially informed, or a counsel specially qualified, in any particular branch of scientific or technical knowledge is apt to take for granted a knowledge on the part of others which they do not possess, and to neglect careful investigation where it might be useful in enabling him to arrive at the truth. The skill of the counsel lies more in his power of extracting information from the witnesses than in the use of any special knowledge of his own with regard to the subject in dispute. The ability of the judge is best seen in the use to which he puts information so placed in possession of the Court. Strange though it may appear, a technical knowledge on the part of the judge is rather apt to bias or weaken his judgment than to assist him in arriving at a correct conclusion. Mr. Justice STEPHEN appears to prefer the evidence of his own eyesight to the testimony of expert witnesses, and in a "light and air" case the other day adjourned to view the premises where the light was alleged to be obstructed. He seems to have personally formed a speedy judgment in the case, and to have given a verdict

accordingly for the defendants. The judgment was no doubt sound and the decision right, but if a judge does not rely on the evidence of experts in these matters, the suitor may be spared the expense of calling them. Judges of the Chancery Division have recently adopted a plan of appointing or selecting a skilled witness to report to the Court independently of the parties to the action, and the plan has been hitherto successful. We are unaware of the amount of technical knowledge possessed by Mr. Justice STEPHEN in "light and air" cases, but it may be doubted whether the learned judge had a proper opportunity for forming a sound judgment during the short adjournment of the Court when he inspected the building. Our judges, moreover, will find abundant and varied occupation if this practice of inspecting the *locus in quo* is generally followed.

A MEETING has lately been held at Earls Barton to form a committee for the purpose of carrying out the restoration of the tower of the famous and interesting old church of Earls Barton. A committee previously appointed has already succeeded in getting in subscriptions for the purpose, and with this as a starting-point there is little reason to expect that the necessary funds needed for the required work will not readily be forthcoming.

A MEETING of the National Smoke Abatement Institution is, we learn, to be held at the Mansion House on Monday next, at three p.m., to report progress and consider measures for further advancing the important objects connected with the Smoke Abatement movement. The meeting will be held under the presidency of the Lord Mayor, supported by the Duke of WESTMINSTER, K.G., the Duke of NORTHUMBERLAND, Sir R. A. CROSS, Sir WILLIAM SIEMENS, F.R.S., and others.

THE arrangements for the annual meeting of the Royal Archæological Institute, to be held at Lewes, are now complete. The Earl of CHICHESTER is president of the meeting, and the presidents of sections are—of antiquities, Major-General A. H. LANE FOX PITT-RIVERS, F.R.S., F.S.A.; of history, Mr. E. A. FREEMAN, D.C.L., LL.D.; and of architecture, Mr. J. T. MICKLETHWAITE, F.S.A. The Mayor of Lewes, Mr. CROSSKEY, heads a large and influential local committee. The inaugural meeting will be held on Tuesday, July 31, at noon, when the president will deliver an address. The Castle and Priory will be afterwards inspected, and the various sections will be opened on that and the two following evenings, when papers will be read. There will be daily excursions in the neighbourhood, among other places to Pevensey Castle, Rye, Winchelsea, Hastings Castle, Battle Abbey, Hurstmonceaux Castle, Worthing, New Shoreham, Old Shoreham, Arundel Castle, &c. The mayor gives a *conversazione* on the Thursday night.

A FIRST Annual Manufacturers' Mediæval, High Art, and Ecclesiastical Furniture and Decorative Exhibition is announced to be held in Humphreys' Hall, Albert Gate, Hyde Park, from August 25 to September 8 next. As a representative trade exhibition, it cannot fail to be most interesting to our readers and the general public, who will have an opportunity of inspecting specimens of Mediæval and high art workmanship in all its varied designs and branches. The ecclesiastical and decorative sections are intended to be specially attractive, many eminent firms in connection with the trade generally having already secured space for their exhibits.

A REPORT has been presented to the Canterbury Town Council by the surveyor on the means of egress from theatres and public halls in the city. In the case of one theatre, there was a narrow corkscrew staircase allowing only one person to come down at a time. Consequent on this report the Council decided to call upon the owners of the halls and the theatre to make all the doors open outwards; and in the case of the theatre, it was further decided to ask the owner to alter the staircase in such a manner as to render it safe, adding that in the event of his failure to do so, the Council would oppose the renewal of the license. It is quite time other towns, who have not yet done so, should institute a like examination. It will be curious to see what revelations follow in consequence.

LANRO QUIRINI TEACHING IN A VENETIAN PIAZZA.

TEMPLEMEERE, OATLANDS PARK, WEYBRIDGE.

THE additions that have from time to time been made to this building have enlarged it from an intended summer-house or smoking-salon to a very commodious mansion. It was originally commenced by the Duke of YORK when residing at Oatlands Park; and His Grace intended to have reproduced as a summer-house a fac-simile of the Temple of VESTA at Rome, but unfortunately the original design was never completed beyond the cornice on the main building and the two columns as shown in this view. The shell remained in this state until some thirty years ago, when it was purchased and converted into a hall for the approach to the few rooms that were built round it.

The present owner, Mr. WILLIAM HEWETT, has lately added the southern wing, as can easily be seen by the plan, and has decorated the interior entirely in keeping with the style of the building, the effect of which is anything but severe. A domed ceiling, richly coffered and groined round the circular windows, has been placed over the entrance-hall, which is nearly 30 feet high; and the walls of the hall are further enriched by niches, as shown on plan, and the pilasters which support the dome. All this work is in carton pierre, by Messrs. JACKSON & SONS, of Rathbone Place. There is a billiard-room under the smoking and morning-room, and to gain sufficient height it has a solid wood-block floor kept one or two feet below the level of the ground.

The situation of the house is most charming, being placed on the extreme edge of the Oatlands Park hills, and having from three aspects views extending for fifteen and twenty miles across the valley of the Thames to Chertsey, Egham, Windsor, Sunbury, &c. The additions have been carried out under the superintendence of Mr. ARTHUR CAWSTON, Architect, of Spring Gardens, S.W.

OTE HALL, SUSSEX.

THIS work has been carried out for Major-General GODMAN, by one of whose ancestors the house was built in the early part of the sixteenth century. The house is of excellent timber construction, with good external and internal details, and, as it was generally in good condition and all unnecessary alteration was carefully avoided, it is now an unusually authentic specimen of the smaller country-house of old date. There is a very good staircase and some good panelling and mantelpieces. The offices, &c., have been placed in a new wing adjoining the old building, so as to avoid interference with the old plan. The architect was Mr. RALPH NEVILL, F.S.A., of Guildford and Gray's Inn, and the builder, Mr. S. NORMAN, of Burgess Hill, and to the latter great credit is due for unusually intelligent care.

BATLEY COTTAGE HOSPITAL.

THE OXFORD ARMS, WARWICK LANE.

THIS ancient hostelry, formerly situated in Warwick Lane, Paternoster Row, was demolished in 1878, and the residence of the minor canons of St. Paul's Cathedral now occupies the site. As will be seen from the illustration, it was an excellent example of the galleried inns at one time so common in London, but now becoming more scarce every year. That the Oxford Arms existed before the Great Fire of London is proved by an advertisement in the *London Gazette* for March 1672-73, quoted in "Cunningham's Handbook of London": "These are to give notice that EDWARD BARTLETT, Oxford carrier, hath removed his Inn in London from the Swan at Holborn Bridge to the Oxford Armes in Warwick Lane, where he did Inn before the Fire. His coaches and wagons going forth on their usual days, Mondays, Wednesdays, and Frydays. He hath also a Hearse, with all things convenient to carry a Corps to any part of England." The inn was within the area of the fire, in which it probably perished, but was rebuilt a few years later on the old plan, the buildings surrounding a large courtyard, and bounded on the western side by the remains of the old city wall.

The following passage occurs in "Stow's Survey," page 33, and points to the antiquity of Warwick Lane, in which this inn was situated: "Nearer to our time, I read, in the 36th of HENRY VI., that the greater estates of the realm being called up to London . . . RICHARD NEVILLE, Earl of WARWICK,"

came "with six hundred men, all in red jackets embroidered with ragged staves before and behind, and was lodged in Warwicke Lane, in whose house there was oftentimes six oxen eaten at a breakfast, and every tavern was full of his meat, for he that had any acquaintance in that house might have there so much of sodden and roast meat as he could prick and carry upon a long dagger." W. H. N.

QUIRINI LECTURING IN VENICE.

WE give an illustration of a remarkable work in bronze, which was completed a few months ago. It was modelled by Signor G. MICHELO, and was cast by his father, who has a great reputation in Italy for his works in metal. The subject is taken from the life of LANRO QUIRINI, who lived in the early part of the fifteenth century. At a time when the ardour for classical and other studies was growing stronger day by day in Italy, it was the endeavour of QUIRINI to bring the new learning to all classes, and hence it is said he discoursed on philosophy in the Piazza dei Mercanti in Venice, and wherever the people congregated. What he taught has long been forgotten, but at that time there were more scholars in Italy than in all the rest of Europe, and QUIRINI, like some of them, may have been a prodigy from his "vastissima erudizione." Italy now possesses an enduring memorial of the philosopher in bronze.

## THE CHANNEL TUNNEL.

THE joint committee appointed by both Houses of Parliament to consider and report upon the general question of the Channel Tunnel met on July 10 to consider the report of Lord Lansdowne, the chairman, and the reports prepared by other members of the committee. The report of Lord Lansdowne declared substantially in favour of the tunnel, and on this the committee first divided, rejecting the report by six to four. The minority were Lord Lansdowne, Lord Aberdare, Mr. Baxter, and Mr. Peel, and the majority were Lord Devon, Lord Camperdown, Lord Barrington, Sir Massey Lopes, Sir Hussey Vivian, and Colonel Harcourt. The committee then proceeded to discuss the remaining reports, of which there were five. All of these were hostile to the scheme, but on different grounds, the reasons advanced in one report for opposing the scheme conflicting with the reasons advanced in another, which arrived, however, at the same conclusion. On the reports of Sir H. Vivian and Lord Barrington the numbers were equal, which was equivalent to their rejection; and as none of the remaining reports gained the approval of the majority, it was ultimately resolved that the report to Parliament should be confined simply to the facts that four were in favour of the scheme and six against it, and that no distinct declaration beyond this could be agreed upon.

## NATIONAL COMPETITION WORKS AT THE SOUTH KENSINGTON MUSEUM.

THE private view of the yearly exhibition of prize works by students of the Government schools of art in this country was held on Thursday. There are now nearly 200 schools of art and branches in the United Kingdom. From these schools, close upon a quarter of a million of drawings, paintings, models, and artistic designs for manufacturers have this year been received and examined by the Art Department. But barely 1,000 of them reached the standard required for "national competition." The rewarded works are now to be publicly exhibited in well-proportioned, top-lighted corridors forming part of the new buildings destined ultimately to accommodate the National Art Library of the South Kensington Museum.

A fresh departure has been taken in the arrangement of the exhibition. Entering its first division, at the eastern end of the gallery, we find it composed only of drawings and paintings each distinguished by the award of a gold medal; in like manner, the works for which silver medals are given form the next section; bronze medal awards the third; and national book prizes the fourth. All these works exemplify in strong or weak degree various "advanced" stages in the course of art instruction propounded by the South Kensington Department for the acceptance of the country. To complete this exemplification a series of specimen drawings of rudimentary work which beginners are set to carry out is added. Upwards of 520 works are thus included in this year's exhibition, which maintains the high and useful standard of careful execution and student-like neatness reached in previous years. Occasionally going beyond this condition so necessary in the early practice of the designer are works which show inventiveness and some originality in the use of recognised canons. Designs for carpets (Nos. 21 and 30) from Glasgow,

based upon Oriental patterns, are probably in advance of many similar productions shown in previous years. A stereotyped class of wall papers of floral patterns, picked out with gold lines, has apparently given place to designs more harmonious in effect and less unsuitable as backgrounds for the sketches, prints, bits of china, &c. There are two or three notable designs for printed stuffs, one (No. 16) from Manchester in particular; while for distinguished elegance, the pattern of garlands and chrysanthemums (No. 1), to be some day, perhaps, woven into a silk hanging at Macclesfield, has rarely been surpassed. That which takes a silver medal (No. 67) comes from Exeter. A feature of promise in this year's exhibition seems to lie in schemes for decorative work in which figure composition plays a leading part. No. 379 is an ambitious design from South Kensington for the lid of a grand pianoforte—a cleverly-drawn composition of sirens luring mariners. A great classic galley, fancifully constructed, with highly-reared prow and architectural temple in the stern, occupies the central position. To the right, upon a rocky foreground, is a group of nude and draped figures, towards whom boatmen are wading from the galley. Sirens swim about the beak and others hover in flight among the tackle. Of quite different character is the set of decorations for a room (No. 73), from the West London School, done chiefly in tones of dark blue, brightened here and there with gold, and of a style which is identified with that used by the late Alfred Stevens and by his pupils for much of the ornamental work of the South Kensington Museum. No. 308, from the same school, four small panels of Apostolical figures merit a book prize, although the student has attempted to model his style upon such broad and free treatment of figure composition as attained a height of excellence through the great Italian masters of the late fifteenth and sixteenth centuries.

Modelling is conspicuously strong this year. The South Kensington and Lambeth Schools of Art hold a pre-eminence in this stage. No. 4, a model of a nude figure from the life, in half-reclining posture, is a good example of what sound instruction may effect.

It may be interesting briefly to note that the Hanley and South Kensington Schools each carry off two gold medals, the remaining gold medals falling to schools at Macclesfield, Hull, Sheffield (No. 5, two cleverly-modelled and appropriate designs for cast-metal panels), Leicester, Brighton, Bloomsbury (No. 11, water-colour painting of flowers), and West London (No. 12, design for tiles). Besides these, 58 silver medals, 105 bronze medals, and about 210 national book prizes have been given.

### THE NATIONAL PORTRAIT GALLERY.

THE twenty-sixth annual report of the trustees of the National Portrait Gallery was issued on Wednesday. Since last report the following donations have been made: John Britton, F.S.A., Mary Ann Cross ("George Eliot"), King George II., Sir William Grant, Professor Richard Parson, Sarah Austen, John Flaxman, R.A., Anne Flaxman, Oliver Goldsmith, John Ramsay McCulloch, Lord John Russell (a marble bust), John Rennie, F.R.S., Sir William Hamilton, K.B., John Singleton Copley, Lord Lyndhurst, Viscount Stratford de Redcliffe, K.G., Admiral Lord Lyons, G.C.B., John Keats (a mask in plaster). The following portraits were purchased: Anne Boleyn, fourth Earl of Southampton, K.G., military group of officers, second Marquis of Londonderry, K.G. (marble bust). A number of autograph letters has been added to the collection.

The Trustees propose to continue the issue of a shilling catalogue as hitherto, with a supplemental catalogue of the latest accessions at sixpence each, and also to provide a simple list of the portraits with dates and painters' names, to be sold for one penny. In a former report to the Board of Treasury, the Trustees stated that "the great success which attended the alterations in the 'High Room' by blocking up all the side windows and opening skylights in the roof instead," induced them to hope that a similar improvement might be effected by Her Majesty's Office of Works in the upper long gallery, where the construction of the roof naturally lent itself to such an arrangement. This proposal having been favourably entertained by Her Majesty's Government, the pictures and busts were forthwith dislodged from the upper long gallery and disposed as far as practicable in other parts of the building. The temporary crowding in some places and the enforced disregard of chronological order continued till the autumn of last year when the pictures were replaced under a completely new arrangement.

At this time the pictures presented by the Society of Judges and Serjeants-at-law from Serjeant's Inn, and by the trustees of the British Museum, which had hitherto been kept together in the "High Room," were, in accordance with an understanding established at the time, dispersed and incorporated in the rest of the collection in chronological order. These pictures, from the vivid colours of the legal costume, are now seen to greater advantage, as they are toned down by being hung in proximity to other portraits which are proportionately relieved from monotony of colour. The "High Room," formerly occupied by the Serjeant's

Inn and British Museum pictures, will now be mainly appropriated to the display of recent acquisitions and to portraits requiring particular attention, until such time as they also may be drafted off and incorporated chronologically in the rest of the series. Inscribed tablets distinguishing the pictures presented by the Society of Serjeant's Inn and the trustees of the British Museum, with historical information regarding the persons represented, are in preparation, and will be affixed to each frame. But these historical notes, being somewhat copious and elaborate, require considerable time for completion. On December 11 last, the new arrangement of the pictures having been completed, the entire series of these galleries was again thrown open to the public. In the new distribution of the pictures and sculptures more space has been assigned to portraits and records of the earliest period. The vestibule at the top of the eastern staircase is occupied by portraits and monumental effigies of the Plantagenet dynasty. Large inscribed placards or tablets, giving dates of the different rulers and explaining the system of classification adopted, have been affixed to the walls and screens throughout the building.

The Trustees in their report of last year referred to their financial position as affected by the large amount which it was thought advisable to spend on the purchase of the Conference picture at the Hamilton sale. The funds specially placed at their disposal for this purpose having been more than exhausted, they have in consequence been considerably crippled in their resources for the current year. They, however, report that the picture in question is universally admitted to be an acquisition well worthy of such a special expenditure, regard being had both to its artistic and its historical merit. They believe that the readiness with which the Government afforded them special facilities on that occasion was fully appreciated by Parliament and the public, and they trust that whenever such opportunities for enriching the gallery present themselves the same consideration may be afforded as materially adding to the public interest in the gallery, an interest which they believe to be steadily progressing.

### HUDDERSFIELD FINE ART AND INDUSTRIAL EXHIBITION.

ON Saturday last the Duke of Somerset, K.G., performed the double ceremony of opening the New Technical School and Mechanics' Institute, and the Fine Art and Industrial Exhibition in connection therewith. The institute dates back more than forty years, and during that period it has performed an exceedingly valuable work with regard to primary, secondary, and technical education; but it was some years ago felt that if Huddersfield and the neighbouring district were to successfully compete with foreign nations in the production of articles of fancy manufacture, it was necessary that still further opportunities should be afforded of acquiring that particular kind of technical instruction which should fit workmen to carry on successfully the various trades in which they were engaged. It was at first decided to extend the old institution, but later councils determined on erecting a new building at a cost of 20,000*l*. Plans were furnished by Mr. Edward Hughes, architect, of Huddersfield, and a handsome and commodious building has been erected. About 15,800*l*. has been already promised or subscribed—the Clothworkers' Company (London) contributing 2,000*l*., Sir John W. Ramsden, 1,000*l*., and so on.

### SANTA FÉ, MEXICO.

SANTA FÉ, the capital of New Mexico and the oldest city in the American Union, is now celebrating its tercentenary, or what is believed to be the 333rd year of its existence. The surrounding region was occupied after a fashion by the Spaniards, under Coronado, who, in 1550, laid out the city, which still preserves in many respects the characteristics of a Mediaeval Spanish town. The houses are mostly one-storeyed. All that are not wooden are built of sun-dried bricks, so that in appearance they differ little from the ground on which they are raised. Even the cathedral and the "palaces" of the Governor and the Archbishop are built in this fashion. The chief industry is gold and silver filigree work, which is frequently of remarkable ingenuity and beauty. Very many exquisite specimens of this work will form one of the chief attractions of the "exhibition," which is itself the principal feature of the tercentennial celebration. The Pueblo Indians also exhibit some very interesting examples of their singular earthenware, which is a combination of the old Mexican work. Some of them represent grotesque figures like the old Aztec divinities; others domestic utensils of all kinds. All of them are usually of bright colours. Some authorities contend that the present city of Santa Fé is only a continuation of an older Aztec town named Cicuye. The railway now connects it directly with the port of Guymas, on the Gulf of California, whence, no doubt, steamers will run across to Australia, Japan, and China, opening up a future hardly dreamt of by the first Spanish settlers,

THE ARTISTS' BENEVOLENT FUND.

LORD THURLOW presided over the seventy-fourth annual festival of this fund, lately held. During the past year 66 widows and 15 orphans of artists received annuities amounting in the whole to the sum of 1,306*l*. Since the institution of the society the sum of 45,690*l*. has been distributed to widows and orphans of artists, the recipients being in circumstances which rendered them proper objects for assistance. The chairman, in proposing the toast of the evening, drew attention to these facts, and commented upon his occupation that night of a position which had been held in bygone days by men of the stamp of Lord Russell and Lord Palmerston. He dwelt upon the uncertainty of the artist's profession, notwithstanding the increase of appreciation shown for art, and said that the perplexities of those who administered the funds had been correspondingly increased. In speaking upon the influence which the work of the artist exercised, he expressed his view that it was outrageous that in this large first city of the Empire the multitude should be debarred from the study of works of art on the Sunday, while in other large places, centres of population, the creations of art were open to the view of the people. He warmly commended the fund to the benevolence of the public. Mr. John Absolon responded to the toast, and then Mr. Lambton Young, the secretary, read the list of subscriptions, which, headed by Her Majesty's annual subscription of 100 guineas, amounted to upwards of 500*l*. Other toasts followed. The musical arrangements were under the direction of Mr. Cozens.

GLASGOW MUNICIPAL BUILDINGS.

At a meeting of the Town Council last week, the tenders sent in for the erection of the municipal buildings were considered.

The Town Clerk read the report by the sub-committee appointed to consider the tenders. The minute contained a report by the architect and measurers to the effect that they had examined ten estimates sent in by ten contractors, and checked the four lowest of these. The four lowest tenders were as follow :—

Contractors.	Amount of original offer.		Amount after checking.	
	If Polmaise stone.	If Dunmore stone.	If Polmaise stone.	If Dunmore stone.
Morrison & Mason .	£ 163,080 3 0	£ 163,080 3 0	£ 163,086 0 3	£ 163,086 0 3
James Watson & Son	170,000 0 0	—	170,000 0 0	—
David Short & Co. .	180,008 0 0	180,008 0 0	180,984 2 0	180,984 2 0
Watt & Wilson .	181,000 0 0	186,350 0 0	180,995 14 1	186,345 14 1

The other offerers were: A. & T. Stewart, 183,496*l*. 14*s*. 10*d*.; F. & D. Meikle, 198,196*l*.; Alex. Muir, 213,089*l*.; Robert M'Cord & Son, 221,600*l*.—221,000*l*.; Edmund Gabbatt, 223,399*l*. 19*s*. 9*d*.—230,399*l*. 19*s*. 9*d*.; John Thomson, 237,991*l*.—224,923*l*. To the tender of Messrs. Morrison & Mason the following condition was attached: "This tender is made on the understanding that it is in our option to take the stones from Polmaise or Dunmore quarries." The reporters stated that in their opinion this condition must be withdrawn before the estimate could be accepted. In preparing their estimate Messrs. Morrison & Mason had omitted to price and extend seven items in the mason-work schedule, which, if priced at the rates of the next lowest offer, would increase the amount of their offer by the sum of about 830*l*. The sub-committee, having considered the report, resolved to recommend that the Council authorise the committee to accept the offer of Messrs. Morrison & Mason, whom failing of James Watson & Son, whom also failing of David Short & Co., whom also failing of Messrs. Watt & Wilson, on the distinct footing and condition as regards the offer of Messrs. Morrison & Mason that the stipulation by them to the effect that they should have the option to use either Polmaise or Dunmore stone shall not receive effect, but that, on the contrary, it shall be in the power of the Corporation to determine which of the descriptions of stone above referred to shall be used either wholly or partially in the construction of the buildings, and subject, as regards the several offerers in the order above set forth, to the further conditions—(1) That the contractors to be preferred shall find sufficient caution, to the satisfaction of the Corporation, for their due and perfect fulfilment of the contract; (2) that the sub-contractors to be employed by the contractors shall be subject to the approval of the architect; and (3) that a contract for the due and proper execution of the work be forthwith entered into between the Corporation and the contractors and their cautioners. Subject to these recommendations, the sub-committee further recommend that it be remitted to the Municipal Buildings Committee to make all the requisite arrangements for proceeding with the work, and fix the time within which the work shall be completed, and the penalties for failure; to determine the stone to be used in the building, and further, to determine as to the

cautioners to be offered by the contractors, and to adjust and complete the contract on behalf of the Corporation.

Mr. Osborne moved the approval of the minutes. As to the stone to be used in the construction of the buildings, the contractors were bound to take it from two quarries. These quarries were substantially the same stone, but it must be in the option of the Corporation to say which of the quarries the stones were to be taken from. The reason why the Council were asked to approve of a written minute was that there was a large amount of brick work connected with the building. The brick to be used required to be of a special form, different from that presently made in the neighbourhood. It was important that they should have summer weather for the manufacture of these bricks, and therefore it was desirable to hasten the completion of the contract.

Treasurer Walls seconded the motion.

Mr. Neil wished to know how the cost of the building would be under the estimate, seeing that the mason work was to cost 164,000*l*.

Mr. Osborne said that was the offer for the whole contract, including mason work, joiner work, slater work, and everything.

The motion was unanimously adopted, and it was remitted to the Building Committee to make arrangements for the ceremony of laying the foundation-stone.

ELECTRIC LIGHTING AT THE SOUTH KENSINGTON MUSEUM.

ON Tuesday evening the picture galleries of the South Kensington Museum were lighted for the first time by the Sun lamp which will henceforth be used for this purpose in lieu of gas. The plant used is composed of a 30 horse-power steam-engine, driving four alternating current Gramme machines, from which eight circuits of five lamps run to the galleries, lighting the two Jones bequest-rooms, seven out of the eight picture-rooms, and the reading-room. In the rooms containing the Jones collection where the lamps are placed low, the light is extremely pleasant and produces no fatigue to the eyes; and in the picture galleries, in which the lamps are suspended from the roof, the colours of the pictures are not at all affected, and the result shows the lamp eminently suited for such a purpose. In the reading-room the lamps are fixed in an inverted position, and the light is obtained by reflection from the walls and ceiling, which renders it soft and perfectly shadowless, thus enabling the visitors to read with comfort, and in any part of the room. The lamps used are each of 1,200 candle-power (estimated), and are fixed in lanterns with opal globes so constructed that they are perfectly noiseless. The light, which is a combination of the arc and incandescent light, is obtained by two carbon pencils which are inserted in a block of marble, a cavity in the latter being heated to incandescence by means of the arc formed. General satisfaction was expressed by the visitors present, and the numerous advantages of the lamp as compared with the gas jets employed in one portion of the galleries were very prominent.

THE SHREWSBURY SHIREHALL.

MR. J. M. LOCKWOOD, of Chester, the architect for the restoration of the Shirehall, has reported on the satisfactory progress made in the works. It will be recollected that after the fire which wrecked the old Shirehall, the outside walls were left comparatively uninjured, and these still remain as they were, but have been cleaned down, so as to match with the new portion in High Street. This latter front is built to correspond with that in the Square, and both are of the well-known Grinshill stone. The building has been very considerably enlarged. From High Street there is a new entrance for the prison van. Over this is an archway of stone, with the borough arms at the top. The principal entrance, that intended for the judges and members of the bar, is the old entrance-hall, which remains much as it did in the old time. After ascending the flight of steps in front, come the entrances for the members of the bar to the courts, and further on are new corridors and vestibules. The corridor is laid with mosaic, after the style of Roman work. At the far end of the corridor is the door leading to the hall-keeper's stairs. On the right and left are the judges' retiring rooms, and also the barristers' robing-room. In the ceilings of the corridor and judges' room are stained-glass lights, and both the judges' rooms and that for the barristers will be fitted up with pitch pine. Turning to the left from the judges' corridor is another smaller corridor, which leads to the grand jury room. Leading from this apartment is a corridor with a mosaic pavement, and out of this are the steps to the grand jury gallery inside the court. There are also retiring rooms for the jury and witnesses, and near all the retiring rooms referred to are lavatories and other conveniences. There are also apartments for the hall keeper, &c. The new mayor's court will be used for borough purposes, and for the police business of the county. The new Crown Court, which

is 52 feet long, 36 feet wide, and 34 feet high, is in the left wing of the building, and possesses—as will also the Nisi Prius Court—two principal entrances. The main door, and the one through which the judges will pass, is that in the centre of the Shirehall, while the witnesses, public, and others will be admitted by the door nearest to High Street. On either side of the court is a gallery, that on the right for juries in waiting, and the one on the left for the use of the grand jury. Immediately below the right-hand gallery is the jury-box, and the court is so constructed that the jury can gain access to their retiring-room from the jury-box without passing through the court, and therefore without running the risk of being interfered with, an inconvenience which they formerly had to submit to. Immediately opposite to the jury-box, and just below the left-hand gallery, is the witness-box, the crier's seat, and adjoining these the reporters' desks. The judge's seat is exactly midway between the witness and the jury. In the rear is the judge's retiring-room, 14 feet by 13 feet, lighted from the ceiling with a window of stained glass. On either side of the judge's seat are seats and desks for the judge's clerk and the high sheriff, and there is accommodation on the bench for about a dozen magistrates. Immediately below the bench are the seats of the associates and the solicitors' table, next to which are two rows of seats for members of the bar, there being accommodation for about twenty-four counsel. Behind the barristers' seats is the dock, and at each end are seats and desks for the governor of the gaol and a warder, and there is communication with the cells below by means of a flight of stone steps. On either side of the dock are four rows of seats for solicitors in waiting, and behind is ample room for persons interested in the cases for trial. In the extreme rear, 7 feet from the ground, is a spacious stone gallery for the accommodation of the general public. Along the front of the gallery is an iron railing, and the floor of it, as also other portions of the court, will be covered with linoleum. All the fittings of the court are of polished oak, while the ceiling is panelled with pine wood and coved, that being the best form for acoustic purposes. In the centre of the ceiling is a very handsome light, containing eight panes of stained glass, in the centre of each of which are the arms of county families. In the first pane, counting from the judge's seat, are the arms of the county of Salop, in the next those of the diocese of Lichfield, in third those of Roger de Montgomery, fourth Lord Hill, fifth Earls of Bradford, sixth E. Pemberton, seventh the Corbet family, and in the eighth the Kenyon family.

### AIX-LA-CHAPELLE CATHEDRAL.

**M. R. G. MAINWARING**, writing from Aix-la-Chapelle, says: A remarkably fine view of the Dom of Charlemagne is temporarily open through the rebuilding of some business premises. The view is from north-east, comprising the choir, with its lancets 85 feet high, the octagon of Karl, and some of the fine decorated northern chapels, and the new spire. The view from the south side is much obscured by trees, and defiled by an incongruous Ionic excrescence. The pending reconstruction of the shop will shut out this view by an erection parallel to and within 12 mètres of the choir, and touching a chapel which projects as a transept. London would not allow Westminster Abbey to be thus blocked in, whatever might be the cost of compensation. London has opened out, at great expense, St. Bride's, St. Martin's, St. Paul's, Westminster Hall, and many other historic edifices. Aachen Cathedral is the heritage of an area not limited by the German frontiers.

The public spirit evinced by Aix in conserving the Stadtwald, ten times the size of Hadley Wood, might well be evinced in rescuing the chief remaining historic monuments of this city. Indeed, it seems incredible that a community which has within the last twenty-five years erected the Marienkirche and St. Jacobs-kirche should permit its cathedral to be insultingly hidden by the desecration now proceeding.

### LEGAL.

**High Court of Justice.—Queen's Bench Division.**

**THE PATENT SILVERING COMPANY v. R. H. PADBURY,  
W. C. WARE, AND H. BURMAN.**

**LIGHT AND AIR CASE.**

This case was heard before Mr. Justice Stephen, it being contended by the plaintiffs that the erection of a skylight on a yard abutting on their premises had injured the light for their trade. The freeholder of the two properties had in granting a lease to the plaintiffs covenanted to make no erection which should interfere with the light of the premises.

The plaintiffs called several witnesses engaged in the trade to support the injury, and also Mr. J. D. Mathews, surveyor. For the defendants the witnesses were Banister Fletcher, A. Peebles, W. W. Groyther, and J. Gibson. Mr. Justice Stephen went to view the premises and the skylight, and on returning gave his verdict for the defendants.

### REVIEWS.

**A PRACTICAL TREATISE ON THE STRENGTH OF MATERIALS, INCLUDING THEIR ELASTICITY AND RESISTANCE TO IMPACT.**  
By **THOMAS BOX**. Published by E. & F. W. Spon.

The books which Mr. Box has written on heat, hydraulics, &c., have been recognised as standard manuals on their subjects. The bulky volume by him on "The Strength of Materials" is likely to become of more general use. The author has many qualifications for the task he has undertaken. He neither accepts with submission the results of other inquirers nor tries to supersede them. His office, as he interprets it, is that of a judge, and he endeavours to derive all the good he can from previous researches, but in the first place he must be satisfied of their accuracy. In describing how he compiled his book he tells us that "every rule has been subjected to the test of experience, almost every available experiment having been examined and compared therewith, the error, or rather the difference per cent. between the rule and experiment being given in each case. When the theoretical laws did not bear that test, they were relentlessly modified or abandoned altogether in favour of empirical rules, whose accuracy was proved by experiment although they did not admit of a theoretical demonstration."

The manner in which Mr. Box deals with the subject will be inferred from the order of the chapters, which is as follows: Tensile strain, rivetted joints, cohesion applied to pipes, strength of chain, ropes, &c.; shearing strain, crushing strain, strength of pillars, connection of pillars with transverse strains, wrinkling strain, transverse strain, "Similar" beams, connection of transverse and other strains, roofs, torsional strain, extension and compression, deflection of beams, torsional elasticity, modulus of elasticity, permanent set, impact, collapse of tubes, factor of safety, and fatigue of materials.

The information which is given under these heads is derived from the experiments of Hodgkinson, Clarke, Kirkaldy, and others, and from the way in which it is presented by Mr. Box it obtains fresh interest. It sometimes would appear that in engineering books the aim of the author is simply to construct neat formulæ, and facts are made to further that end in a marvellous way. Mr. Box does not believe in sacrificing truth to mathematics. If things do not appear to be resolvable he says so plainly, and does not attempt to reduce them. "It is impossible," he says in one place, "to give general ratios for the strength of pillars of different materials, which will be correct for all diameters and lengths. Mr. Hodgkinson has given a series of numbers as the ratios of strength for cast-iron, wrought-iron, steel, and timber pillars, but these are simply misleading, for if they are correct for a particular diameter and length they must of necessity be incorrect for all other dimensions." This extract will indicate the spirit of the book and the independence of the author. His desire is to give information that will be useful in practice, and which accordingly must be trustworthy. Problems which are outside practice are left to physicists and mathematicians to determine. The book is clearly arranged, and must be commended as a valuable addition to professional literature. The diagrams are well lithographed, but if they had been introduced in the text, instead of in plates at the end, the references to them would have been less troublesome.

**LETT'S POPULAR ATLAS.** Complete Edition. Published by Letts, Son & Co., Limited.

According to Cardinal Newman there cannot be a nobler, wider, or more philosophical subject than geography. It runs, he says, collaterally with the history of the crust of the earth or geology on the one hand, and with the history of the human race on the other, and it is difficult to hinder it from embracing ethnology and the philosophy of the relations between human nature, physical and moral, and the material dwelling-place where man passes the probationary portion of his existence. But it is only in Germany that the manifold relations of geography are studied as a necessary branch of education, and as carefully as they deserve. In England, ignorance of the subject is often exhibited by our public men in a way which is as amusing as the amazement of an English Premier in the last century when he heard that Cape Breton was an island. One of the causes which has prevented people from having accurate notions of the subject has been the scarcity of cheap and good atlases. Long ago the Useful Knowledge Society tried to supply the deficiency. The maps were excellent and cheap, but the sixpenny sheets were uncoloured. A coloured sheet was a shilling at least, for in those days there was no colour printing, and copies had to be tinted by hand. When a map is plain it does not strike the eye sufficiently to impress geographical facts upon the mind, and so many things have now to be shown in colour on a map that hand work has become useless for the purpose. What can be done by colour printing, as a means of producing a cheap and elaborate atlas, is exemplified in the "Popular Atlas" of Messrs. Letts, Son & Co., Limited. When the price, the quantity, and quality of the work are considered the volume is a marvel. It contains 156 double-page maps, an exhaustive index of 23,000 names, and is sold for two guineas, or at the rate of about 3d. a map. All the countries of the world are shown according to the latest authorities; there are twenty-seven maps of England, Scot-

land, and Ireland, showing geology, watersheds, &c., and plans of the principal cities in the world. There are twelve sheets for India. Where the oceans appear the depths are given, and if there is a vacant corner on a map it is filled with statistics or other information. Several astronomical charts are also included. The atlas represents an enormous amount of labour in its preparation, and could not have been produced without a large expenditure of money. How it is to repay the publishers is not clear. The atlas is adapted for the counting-house as well as the library. The trade routes, lighthouses, &c., are laid down, and the places where British consuls, vice-consuls, or agents are stationed are distinctly marked. It should find a place in all English merchants' offices throughout the world, and for general reference it is invaluable.

THE BIBLIOGRAPHER: A JOURNAL OF BOOK LORE. Vol. III. Published by Elliot Stock.

The world of books, which, according to the poet, is both real and good, is the subject of the monthly "Bibliographer;" everything relating to books, their binding, title-pages, errata, printers, publishers, is treated as if they were of equal importance with political events. Sometimes the writers even condescend to refer to the authors. The "Bibliographer" is a most fascinating periodical. One curious error is noted. It is by a Birmingham bookseller, who under the head of "Architecture" has placed "Le Pâtissier Pittoresque." But this is excusable, for the work contains 425 plates of pavilions, rotundas, temples, ruins, &c.

### ART WORKMANSHIP.

**Stained Glass.**—A two-light window executed by Messrs. Wailes & Strang, of Newcastle-on-Tyne, has just been erected in Storrington Church, Sussex. The window has been designed as a memorial of the late Charles J. Farnham, who died at Rome, at the early age of twenty, on January 30 last, and has been erected by friends and fellow-pupils. The subjects represented are the Baptism in the Jordan and the Last Supper. The work has been executed in the best style of the firm. The essential characteristics of Early English have been followed, but according to request the expressions and action of the figures has been rendered in a natural manner, avoiding all grotesqueness or other conventionalism. A large brass placed under the window is devoted to the memorial inscription.

### NEW BUILDINGS.

**Bolton.**—The plans for twenty-eight new dwellings about to be erected in the Haulgh by the trustees of Dr. and Mrs. Chadwick's charities in lieu of those in Peabody Street, sold to the London and North-Western Railway Company, have been prepared by Mr. Simpson, architect, of Acresfield, Bolton.

**Canterbury.**—The London and County Banking Company Limited, intend to rebuild the premises on the Parade, where the business of the Canterbury branch has been carried on for so many years. The building, which is estimated to cost about 8,000*l.*, will be erected from the designs of Mr. J. G. Hall, city surveyor of Canterbury.

**Cardiff.**—A large horse repository, with stalls for 100 horses, carriage show-rooms, shoeing forge, covered yard for sales and riding-school, offices, saddler's shop, &c., was recently opened in Cardiff, having been erected on a site near the Great Western Railway Station, for Messrs. Gottwaltz, Bowring & Hughes. Messrs. W. D. Blessley & Aspinall, of Cardiff, were the architects, and Mr. W. White, of Swansea, the contractor.

**Dudley.**—The foundation-stone of the buildings for the Dudley Free Library and School of Art has been laid. The works are being carried out by Messrs. Webb & Round, builders, Dudley, under the superintendence of Mr. J. J. Bateman and Mr. B. Corser, architects, Birmingham, whose plans were selected in limited competition.

**Hyde.**—The foundation-stone has been laid of a new town hall, at Hyde, Lancashire. The architect is Mr. J. W. Beaumont, Manchester, whose design was selected in competition. The contractor is Mr. Samuel Robinson, builder, of Hyde.

**Kirkcaldy.**—The memorial-stone of a public hall at Pathhead, Kirkcaldy, has been laid. The hall occupies a position in the leading street of Pathhead. Seating accommodation will be provided for 800, though the hall is capable on an emergency of holding 1,000. The plans were prepared by Messrs. Campbell, Douglas & Sellars, Glasgow, who have chosen the simple Classical style prevailing in Scotland during the seventeenth century. Besides the hall proper, a reading-room, library, billiard-room, and other accessories have been provided. The total cost of the building is estimated at 3,560*l.*

**Stainland.**—The memorial-stones of the Stainland Mechanics' Hall have been laid. It is being erected from the designs and under the superintendence of Messrs. Leeming & Leeming, architects, of

Northgate Chambers, Halifax. The builders are Normanton & Whiteley, of Stainland, masons; A. Park, of Stainland, joiner; S. Collins, of Sowood, plasterer and slater and painter; J. Naylor, of Halifax, plumber, &c.; Taylor & Parsons, of Bradford, white-smiths; and Rodgers & Roberts, of Holywell Green, carvers. The contracts amounted to 1,816*l.* 12*s.*, exclusive of cost of land, furniture, &c.

**Whitby.**—A residence for Mr. William Wright is now being erected in Upgang Road, Whitby, from the designs of Messrs. Perkin & Bulmer, of Leeds. The materials are red New Holland bricks with stone dressings, and timber gables filled in with brick and cemented on face, and covered with green Welsh slating. The stables are completed, and consist of carriage and wash-houses, saddle-room, hay and corn chamber, two stalls, and two loose boxes.

Premises specially planned to suit the requirements of Mr. Charles Fisher's business in Silver Street, Whitby, are now completed, and consist of plumber's shop, office, and warehouse three storeys high, with residence, yard, &c. The builder was Mr. John White, of Whitby, and the architects Messrs. Perkin & Bulmer, Leeds.

Four houses in the half-timbered style, and two cottages adjoining in Stakesby's Vale, Whitby, have been recently erected from the plans of Messrs. Perkin & Bulmer, Leeds, for Mr. William Wright.

**York.**—The new premises in Davygate, for Mr. Alderman Melrose, are now completed. The building is faced with New Holland pressed red bricks and Tadcaster stone dressings. The ground floor consists of wine merchants' offices and two shops. The first and second floors are occupied as offices and house-keeper's apartments, &c. The whole of the shops and offices are let and occupied. The building has been carried out by Mr. William Biscomb, contractor, York, from drawings prepared by Messrs. Perkin & Bulmer, architects, Leeds.

### CHURCH BUILDING AND RESTORATION.

**Appleby.**—The village church of Appleby has been reopened after restoration. The style of the building is of the Decorative period. In the course of the work the tower has been heightened and a new entrance-porch built. The architect was Mr. Crowther, of Manchester, and the contractor, Mr. Hopkinson, of Retford.

**Benfieldside.**—Works of extension have been completed at the parish church, comprising a south aisle and shallow transept, 61 feet by 13 feet, providing seats for 111 adults. The organ-chamber, 17 feet by 14 feet, has a lofty arch opening into transept, and double arches next the chancel, with corresponding arches opposite. By this means seats for forty adults and boys are obtained. A choir vestry has also been added at the south-west side of the church. The works generally have been carried out by local tradesmen of Shotley Bridge and Blackhill. The cost, exclusive of private gifts, will be about 1,650*l.* Mr. J. W. Walton-Wilson is the architect.

**Birkenhead.**—A chancel and side chapel which, with a tower, have been added to St. Peter's Church, have been opened. The structure, as now completed, containing a total accommodation of 838 sittings, consists of a nave with side aisles, 76 feet long and 54 feet wide, with sitting accommodation for 739; a morning chapel, 27 feet by 21 feet on the north side, providing accommodation for 60; a large chancel, 31 feet by 24 feet, with apsidal end, contains choir stalls for 39; and there is a tower on the south side containing an entrance portal and clergy vestry, with organ chamber overhead, opening into the chancel. The choir vestry is arranged on the basement floor. The materials used are red brick, with moulded brick decorative features, freestone being but sparsely used; it is dependent for architectural effect upon its proportion and treatment. The walls of the chapel, as also the chancel, are wholly finished in brickwork, the moulded strings, shafts, and other decorative features being executed by the New Ferry Brick Company. In style the first erected portion of the works are of an emphasised Early French character, and the last completed works have been designed to accord therewith, and the tower, which is 19 feet square, rises to a height of 130 feet from the street level to the top of the vane. The works have been executed by Mr. W. H. Forde, of Birkenhead; the heating and gasfitting by Mr. Henry Thompson, of Birkenhead, and the window glazing by Messrs. Forrest, of Liverpool. The works have been designed and superintended by Mr. David Walker, architect, Liverpool.

**Chorley.**—A new church is being erected at Adlington, from designs by Messrs. T. D. Barry & Son. The church, when completed, according to the plans, will consist of chancel, 32 feet by 23 feet; nave, 82 feet by 25 feet; north and south aisles, 82 feet by 10 feet 6 inches; north and south transepts, 21 feet by 14 feet; organ-chamber at the north-east, 18 feet by 15 feet; clergy vestry, 12 feet by 11 feet 6 inches; choir vestry, 12 feet 6 inches by 13 feet 6 inches. These are at the south-east, and can be thrown into one

when required. The tower is placed in the second bay of the south aisle, and the principal entrance is through it.

**Harpurhey.**—The memorial-stones of a new Wesleyan chapel have been laid. The chapel will be built in Renaissance style, having a tower at one angle, rising to the height of 80 feet, in which will be placed extraction coils and shafts to assist the ventilation. The heating will be by means of hot water on the low-pressure principle. The architects are Messrs. William Waddington & Son, of Cross Street, Manchester, and the contractor is Mr. James Macfarlane, of Churnett Street.

**Holloway, Derbyshire.**—Memorial-stones of a new Primitive Methodist chapel were laid at Holloway on Wednesday, the 4th inst. It is picturesquely situated on the side of the hill, with foliage abounding all around, and the architect—Mr. John Wills, of Derby—has designed it after the Old English, with timbered gables. It is in close proximity to Leahurst, the residence of Miss Nightingale, and will form a conspicuous feature in one of the most beautiful of Derbyshire valleys. The chapel will seat 250 persons. Mr. B. Askew, of Matlock Bridge, is the contractor.

**Llandyssil, S. Wales.**—A new Unitarian chapel is being erected here after designs by Mr. John Wills, of Derby. It stands on an excellent site, and will be the best architectural feature of the place. The front will have a mullioned window, with twelfth century tracery, and a tower rises over the porch. The glazing will all be in cathedral rolled glass, and the internal fittings of pitch pine. The contractor is Mr. Watkin Davies, of Llandyssil.

**Narborough.**—The church of All Saints, Narborough, has been reopened after restoration. Mr. Bacon was the architect, and Mr. J. Clifton acted as clerk of works. The wrought-iron chancel screens were supplied by Mr. Burbidge, of Leicester; the chancel-gates and altar-rail standards by Mr. Barford, of Maidenhead; memorial brasswork by Messrs. Hart, Son, Peard & Co., of London. The masons were Messrs. Thrall & Payne, Leicester; the joiner-work was executed by Mr. Stirk, of Leicester; and the granite walling by Messrs. Langton, of Enderby.

**Old Lenton, Notts.**—A new Primitive Methodist chapel was opened on the 5th inst. It seats 350 adults, and has school-rooms and class-rooms for 200 children. The style is Eleventh Century English, and is carefully treated throughout. Very complete provision is made for opening the class-rooms into the school-room, and also for the usual modern requirements. The cost of the building is 1,500*l.* The architect is Mr. Wills, of Derby, and the contractors Messrs. Savage & Attewell, of Nottingham.

**Preston-on-Wye.**—The church of St. Lawrence has been reopened after restoration. The work has been carried out under the direction of Mr. T. Nicholson, diocesan architect, Hereford. The contractors were Messrs. Davies & Hiles. The cost of the work has been about 1,400*l.*

**Sal.**—The new church of St. Paul's was opened on the 30th ult. The style is Early English, and the building has been erected under the direction of Mr. H. R. Price, architect, Manchester, by Mr. J. Herd, contractor. Accommodation has been provided for 700 worshippers. The cost of the work amounts to 5,000*l.* The tower has not yet been erected. Internally the church consists of nave, two side aisles, and chancel.

## ARCHÆOLOGY.

**The French Archæological Society**, founded in 1853 by M. A. de Caumont, is about to celebrate its long course of useful work by a general congress at Caen, on July 16. In addition to the usual business of such annual meetings and to visits paid to the monuments abounding in Caen, and also to an excursion on the 19th to Bayeux, the programme of operations contains a novel and attractive feature in a three days' excursion, to commence on the 23rd inst., from Granville to Jersey, where the French Archæological Society will be received by Colonel Le Cornu, President of the Société Jersiaise.

## GENERAL.

**Mr. C. R. Gribble** has been appointed architect to the National Provincial Bank of England.

**The Honorary Degree of LL.D.** has been conferred, by the University of Cambridge on Mr. G. F. Watts, R.A., and on Mr. R. Stuart Poole, keeper of coins and medals at the British Museum.

**The President and Council of the Royal Academy** gave their annual conversation on Wednesday evening. The guests were received by Sir Frederick Leighton, who has now recovered from his recent indisposition.

**An Evening Fête** will take place at the International Fisheries Exhibition on the 18th inst., at nine o'clock, under the special patronage of their Royal Highnesses the Prince and Princess of Wales, in aid of the funds for the erection of an English church in Berlin.

**Professor Anton von Werner**, Director of the Royal Academy, Berlin, was taken ill while painting in his studio, and has been ordered absolute repose.

**Mr. W. Tanner**, of Newport, has been appointed surveyor for the county of Monmouthshire. There were 114 applicants for the post.

**The Weston-super-Mare Town Commissioners** have sanctioned plans for the erection of a new promenade pier over a mile in length, to cost 70,000*l.* This scheme, together with that for a new sea front, will involve an expenditure of 100,000*l.*

**Messrs. Debenham, Tewson, Farmer & Bridgewater** ask us to state that they are the agents concerned in the sale of Devizes Castle, to which attention was drawn in our columns of Saturday last.

**A Portrait** of the late Admiral of the Fleet, Sir James Hope, G.C.B., painted by Mr. Sydney Hodges, has just been placed in the Nelson Room of Greenwich Hospital. It has been subscribed for by numerous friends and followers of this distinguished naval officer.

**A Sanatorium** for foreign cattle is to be constructed at St. Lawrence, Newcastle-on-Tyne, at an estimated cost of 8,880*l.*

**When the Vote for the British Museum** is proposed in Committee of Supply, and the House is asked to agree to an expenditure of 45,000*l.* for the purchase of the Stowe portion of the Ashburnham manuscripts, exception will be taken by some honourable gentlemen below the gangway at the Ministerial side of the House to the application of public money for the purpose.

**The Trustees** of the Middlesbrough High School have decided to proceed with the erection of the east wing, and to solicit subscriptions for the purpose. Mr. Alfred Waterhouse, A.R.A., is the architect, and the estimated cost of the work is 6,500*l.*

**The National Health Society** have awarded a silver medal—the highest award—to Messrs. William Woollams & Co. for their artistic wall papers, free from arsenic.

**Ventilation of the Cork Exhibition.**—Messrs. Robert Boyle & Son's, 64 Holborn Viaduct, E.C., and Glasgow, patent self-acting air-pump ventilators are applied for the ventilation of the International Exhibition at present being held in Cork.

**The Work** of demolishing the old fortifications of Calais, and filling in the deep fosses which surround that town, are now being actively proceeded with. The total estimated expenditure on the undertaking is 600,000 frs. The work, together with the important harbour works which are being rapidly pushed forward in Dover, is destined to effect an important change in the history of this ancient town.

**The Anniversary Meeting of the Sanitary Institute of Great Britain** was held at the Royal Institution, Albemarle Street, on Thursday. The chair was taken by Professor Humphry, M.D., F.R.S., and an address was delivered by W. Eassie, C.E., F.L.S., F.G.S., entitled "The Relationship between Geology and Sanitation." The medals and certificates awarded to the successful exhibitors at the exhibition at Newcastle, in 1882, were presented at the meeting.

**The London Sanitary Protection Association** are to hold a meeting in the Kensington Town Hall on Tuesday, the 17th inst., at 8.30 P.M., at which the newly-elected president, the Duke of Argyll, will take the chair for the first time, and will deliver an address upon this subject. Tickets can be obtained gratis on application to the secretary of the association at its office, 1 Adam Street, Adelphi.

**Artisans' Dwellings.**—The Industrial Dwellings Company, of which Sir Sydney Waterlow, M.P., is chairman, has acquired from the Metropolitan Board of Works over an acre of land in Soho, having frontages to the new street from Charing Cross to Oxford Street, on which nearly a thousand rooms will be erected. Up to the present time this company has provided for the accommodation of about 25,000 persons of the working classes in various parts of London.

**Exhibition of Christmas Cards.**—The organisers of the forthcoming Printers' Exhibition at the Agricultural Hall are arranging for a comprehensive display of designs for Christmas, New Year, birthday, and other congratulatory cards, and of paintings in oil and water-colour, etchings, &c., of a nature suitable for cheap reproduction and sale by stationers. No limit is assigned to the number of designs to be admitted, but the manager reserves to himself the right to exclude contributions which do not satisfy a fair standard of merit. Exhibits must not reach the hall later than the 25th inst.

**Building Societies' Protection Association.**—At a meeting of the executive committee of this association, the following resolution was unanimously adopted: "That, in the opinion of this meeting, it is desirable that the attention of building societies generally should be called to the heavy ground rents to which comparatively small houses are frequently liable, especially in the suburbs of the metropolis; and that, unless in exceptional cases, advances should not be made on property where the ground rent exceeds one-sixth of the estimated rack rental."

# SUPPLEMENT

TO THE

# ARCHITECT

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, JULY 14, 1883.

### COMPETITIONS OPEN.

**BELFAST.**—Aug. 1.—Designs are invited for proposed Public Library. Premiums of £100, £50, and £25. Mr. Samuel Block, Town Clerk, Town Hall, Belfast.

BATH STONE.

BOX GROUND, CORSHAM DOWN, FARLEIGH DOWN, COMBE DOWN, STOKE GROUND, WINSLEY GROUND WESTWOOD AND BETHEL. SUPPLIED BY PICTOR & SONS, BOX, WILTS.

BY HER MAJESTY'S ROYAL LETTERS PATENT

ESTABLISHED A.D. 1774.

AUSTIN'S

NEW IMPERIAL PATENT SUPERFINE FLAX LINE.

The above article is now being manufactured and sold in large quantities for Greenhouse Shutes, Public-house Shutters, and other heavy work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making five qualities; and they strongly recommend that in all cases they should be purchased in preference to the patent lines made from jute, which article has neither the strength nor the durability of flax, consequently cannot give so much satisfaction to the consumer.

They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.

They can be obtained of all Rope-makers, Ironmongers, Merchants, Factors, and Wholesale Houses in town or country.

N.B.—Please note that all our goods as advertised above are labelled either inside or outside with our Trade Mark—The "ANCHOR."

POLONCEAU AND SEYSSSEL ASPHALTE.

ESTABLISHED 1838.

For Covering Flat Roofs, Paving and Flooring of every description, especially in places subject to damp and vermin. This asphalt is now extensively used for paving Stables (as shown above), the absence of joints preventing the generation of ammonia. For Estimates and Prices, &c., apply to JOHN PILKINGTON, 15 Fish Street Hill, London, E.C. Country Builders supplied with Asphalt in bulk for covering Footings, Barn-floors, &c., with instructions to lay it down.

ACCIDENTS!—64 Cornhill. No man is safe from accidents! Wise men insure against their cost! Accidents by land or water insured against by the Railway Passengers' Assurance Company. The oldest and largest Company, insuring against accidents of all kinds. Subscribed capital £1,000,000. Paid-up capital and reserve £250,000. Moderate premiums. Bonus allowed to insurers after five years. £1,840,000 has been paid as compensation.

Apply to the Clerks at the Railway Stations, the Local Agents, or 8 Grand Hotel Buildings, Charing Cross; or at the Head Office, 64 Cornhill, London.

WILLIAM J. VIAN, Secretary.

NEARLY READY.

# The Architect.

## SANITATION SOCIETIES: THE POSITION OF ARCHITECTS.

ERHAPS it is not altogether sanitary science, or even the practice of sanitation, in the full sense of either of these terms, but something that is to be called sanitary business is certainly making considerable progress with the public. A few weeks ago, for instance, the presence of royalty was secured for the opening of the new "Parkes Museum of Hygiene."

One day last week the formal annual meeting of a new organisation, with the imposing title of the "Sanitary Institute of Great Britain," was held in no less dignified a place than the Royal Institution, when many medals and certificates of merit were handed to the representatives of new and improved appliances of health produced all over the country. "Sanitary Inspection Associations" are also being established in various large towns, with what seems to be regarded as a sufficient prospect of success. Annual dinners, moreover, are being eaten in remembrance of these various institutions, which is always a practical sign of their supporters "meaning business." So, there can be no doubt of it, we are spectators of a vigorous public movement in the direction of sanitation. It is no disparagement of such a movement to observe that it is limited for the present to the improvement of the healthiness of dwelling-houses, and, indeed, confined almost entirely to the improvement of drainage apparatus. Such is the case for two simple reasons: not only is the wholesomeness of our dwellings a consideration of the very foremost importance, but there is so much to be done, as matter of fact, in this first field, that it may, indeed, be some time before we see any other department of the enterprise attacked with energy.

We have not failed to discuss occasionally in this journal the important issues that have been raised in connection with domestic sanitation; and we cannot help viewing with continuous interest the measures which are being taken to give practical effect to the advance of public intelligence and the formation of public opinion thereon. We may therefore be permitted now to inquire whether the enterprise as a whole has reached the point at which the practical question may be asked—*What position do architects mean to assume?* Putting the case very plainly, there are to be seen in the lists of the promoters and managers of the new sanitary institutions the names of so very few architects, and those of so unpretending a character, that no practical man can well help wondering what such a circumstance indicates. Who is entitled to take the lead in any matter of house building before the architect? Who else is bound, as he is bound, to see personally to all such affairs? Is he above his business? Is he ignorant of his business? Is there anything in the mere sanitation of the houses he builds, the responsibility for which, in the face of a practical people, he can venture to propose to delegate permanently to someone else? No one who has any appreciation of the function of what is called a profession, or even of a trade, in this purely commercial nation, can fail to see that these are serious questions, and questions that must sooner or later be seriously answered.

The chief idea which lies at the root, we may say, of such organisations as we have alluded to, is no doubt the manifest expediency of promoting the examination and amendment of the haphazard drainage appliances of the common run of houses. The leading doctrine is that they are both badly contrived and badly executed, and that the health of the people is almost as much prejudiced as benefited by them—at any rate, very greatly and quite needlessly prejudiced, and this especially, of course, in large towns. It is on this incidental ground, perhaps, that the movement has been initiated, as it has been, without the leadership of architects. Doubtless a sanitary surveyor is prepared to deal with new houses as well as old, and important ones as well as unimportant; and doubtless also there are not wanting instances in which houses of the best have been carelessly contrived in sanitary respects by architects of the best.

We may admit—it would be both disingenuous and useless to attempt to deny it—that the proper arrangements as regards the drainage of a house are not even yet understood as they ought to be by architects of certain classes. We may even go further, and acknowledge that all architects require at this moment to devote special attention to the study of the experimental science of drainage. But all this is because this science of drainage is in a certain sense a new science; and we do not in any way acknowledge the existence of professional negligence because a new science, albeit a small and simple one, takes time to develop. Our argument is only this—that the sanitary movement cannot permanently dispense with practical architectural leadership; and we are asking the question when this leadership is to be introduced. Three or four gentlemen educated for physicians, with a handful of miscellaneous "civil engineers," may suffice to bring the matter before the public in a sort of amateur way; but when the public are fully alive to the necessity for action, it is not to specialists of this empirical and self-constituted order that they will look, but to the experienced profession of practical men of business, on whose shoulders alone the responsibility for house-contrivance rests by the express appointment of society. Such design, in a word, is the work that is committed to the architectural profession to do; it is the *raison d'être* of the architect's existence; he is *architectus*, the chief of the workmen, or nothing at all; and the English public will never consent to relieve him from any part of his work; "he must do it all, or it will not be done," is the language of simple common sense.

That the men who are the practical leaders of the architectural profession, so soon as they are brought to study the new science seriously, will be found fully and readily equal to all the necessities of the case, it would be idle to deny. When the time comes for their decided action, it will no doubt be said that they are taking up the work of the present pioneers and reaping where they have not sowed; but that cannot be helped. We are inclined simply to say that if they delay their action much longer, mischief may come of it. The Institute of Architects, in short, ought to move in the matter, and the sooner this is done the better for all concerned. We say this because, as it seems to us, the only other alternative is the establishment of a special association of architects—to all intents and purposes an association of the members of the Institute to do the work of the Institute—for attending to the sanitary part of architectural business, and for advancing in a way at once theoretical and practical the scientific study of the subject. One of the principal purposes which the new sanitary societies profess to have in view is the examination of sanitary surveyors and their certification for specialist practice. This, we venture to think, is a pragmatic project that has no prospect of success. If there is to be such a thing as a diploma set on foot for the practice of wholesome house-building, in whatever way, it is the great house-building guild of the country that must undertake the administration of it, and not a little committee of amateurs. We stumbled at random the other day upon an odd phrase in an American journal. The advice that he had received, said the unabashed writer, "to go in for hygiene as a promising lead," was sound. . . . My new American Universal Ventilator is a success—can be applied to anything, from a hat to a hospital;" and so the next proposal of this enterprising philanthropist is "to start a daily hygienic journal . . . to be printed on medicated paper," and so on. If some of our English sanitarians are only "going in for hygiene as a promising lead," no one need object; it is the way of a commercial community; but so soon as this has come to anything of real public utility, the practical work, we repeat, must be taken up by the practical men who are duly qualified and appointed to serve the public *secundum artem*.

Judging by the observations which are now and then made in public—a little too zealously perhaps—with reference to the subject in hand, it would appear that some of our chief amateur sanitarians are inclined to regard the English architect as a futile official, who not only can be easily dispensed with by clever people, but can scarcely be expected, in any business of his own, to be the possessor of such skill as belongs to common sense. We have not heard so much of this doctrine in its relation to general affairs as we were accustomed to a few years back; it would seem as if some class of our practitioners, who were wont to provoke especially the anger of the scorners, may have disappeared. Perhaps the succession of playful Queen ANNE art to the abdicated ascendancy, of austere Gothic may have brought about this result in partial

atonement for its own little sins; but so it is, and the architect is certainly not at present the butt of animadversion that he used to be. But we take it upon us to say that, so far as it goes, the new distrust of the architect will prove quite as foolish as past distrust of him has been. There is something in the lifelong habituation of the mind to the special contrivance of buildings, which those who do not happen to possess it by the regular means can scarcely ever acquire or understand; and we have no hesitation in asserting that already, in the matter of improved drainage—crotchets apart—there is as good average work being done by the ordinary run of architects, privately and quite without pretence, as any fair average of the best specialists in the so-called profession of sanitary engineering can possibly show. The real working architect of everyday English business is not the distinguished artist or the prominent dignitary of the Institute; in most cases he is not a member of the Institute at all, and, if an artist—possibly a clever artist—a modest one. It is men of this stamp who are the backbone of the profession as regards the esteem of the public; indeed, in the aggregate, they do almost all the work of the country and make almost all the money; and it is these who, as they must before long take sole charge of domestic sanitation, will be found to be already taking partial charge of it with sufficient success. But still we want in these days, in every important professional movement, a formal recognition of the work at the hands of authority, and this we think it is obviously the function of a Royal Institute of Architects to supply. When the holidays are over, we hope to find some of the more enterprising and practical members taking up this matter with earnestness—not two or three half-informed casual inquirers, but a sufficient number of really expert scientific men to represent the whole force of the profession, and probably to be constituted one of the standing committees of the Institute.

### M. JULES DIDIER.

[BY A CORRESPONDENT.]

IN 1858, the Council of the Ecole des Beaux-Arts issued a decree in virtue of which the professorship of landscape painting was *supprimé*; the class of students of that special branch of art was consequently dispersed. JULES DIDIER was one of the last pupils who carried off the Prix de Rome, by an historical landscape. His father, the founder of the *Librairie Académique*, educated his son in the strict principles of classicism. A profound reverence for the antique, an abhorrence of impressivism, and, indeed, of innovation generally, were carefully inculcated in young DIDIER's home, and when his manifest vocation for art study compelled his father to decide on the master under whose direction he should acquire his first principles of art, COGNIET, then in the *apogée* of his fame, was the professor selected. COGNIET's *atelier* was crowded by the aspiring geniuses of the day. Among JULES DIDIER's class-comrades were the great portraitist BONNAT, whose finest work, perhaps, is his portrait of his old master, and JULES LEFEBVRE, whose *Psyché*, "l'étoile au front, les mains tenant le sort du monde," attracted so much attention at the Salon of this season. COGNIET's studio formed the majority of the men who have come to the front within the last twenty years. The old man was a stern disciplinarian. He detested smoking in all its phases. From the *bien culottée* pipe to the delicate cigarilla all means of imbibing the noxious weed were equally hateful to him. "Impossible," he maintained, was it "to preserve *mens sana in corpore sano* while inhaling an atmosphere charged with vile smoke, and as to judging the effects of gradated light, for instance, *Sacrebleu, jamais!*" Having delivered these sentiments, COGNIET would leave the studio, at which he appeared but twice in the week. A model being engaged for eight days only, the students had to make the best of their opportunities. If, however, on entering to give his lesson, the old man perceived a cloud of tobacco smoke, he simply shut the door and did not return for days, the pupils thus losing the benefit of his correction of their drawings of a model who had probably been changed since old COGNIET's last visit. *Tant-pis* for them! JULES DIDIER studied lithography as well as landscape painting under COGNIET's direction. In the pre-photographic days, lithography was almost the only means of obtaining a popular reproduction of the works of the time. The revived art of etching was then in abeyance. JULES LAURENS and DIDIER

emulated MOUILLERON in their lithographs of TROVONS and DIAZ landscapes, and of FROMENTIN's scenes of camp life in Algiers. Specially remarked at the time were DIDIER's lithographs of ROSA BONHEUR's *Cheval de Trait*, and of her *Chevreuils*. In 1857 young DIDIER carried off the Prix de Rome by his *Diana Surrounded by Nymphs*, and consequently left COGNIET's *atelier* for Rome.

Life at the Villa Médicis was in those days pleasant. The fortunate prizemen had 200*l.* a year at their disposal for five years, which a quarter of a century back sufficed them, for Rome did not then rival Paris in the excessive dearness of the necessaries of life. Under the Republican Government it has been impossible for the *Ministre des Beaux-Arts* to obtain an increased stipend commensurate with the higher rate of living, and the sum hitherto allowed for five years' residence having been found insufficient, the prizemen are henceforth restricted to a four years' course of study in Italy. M. SCHULTZ was professor in residence when JULES DIDIER reached Rome. The situation of the Villa on the Pincio, commanding as it does an extensive view over Rome from one side and over the Campagna from the other, is particularly happy. An *atelier*, besides a furnished apartment, is allowed to each of the students, who meet in the refectory for their meals, and, moreover, enjoy the use of a magnificent *salle* wherein to receive their friends. Professor SCHULTZ presided over the advancing fortunes of no less than four successive generations of young artists, who speak of him with reverence, as having been accessible to all who sought advice from him, but as having carefully abstained from the slightest interference with them. At the expiration of three years at the Villa, JULES DIDIER started for Naples, Florence, and Venice, in accordance with the programme of the *Ecole des Beaux-Arts*. Architect pupils proceed to Greece and Turkey to study Greek and Byzantine architecture, and are allowed a considerable sum in addition to that given to painters and sculptors, in order to defray the expense of these travels.

The study of POUSSIN, whose works are scattered over Italy, made a profound impression on DIDIER. It is evident, not only by the choice of his subjects, but by the manner of his composition, that to this day POUSSIN is his ideal; but specially is the influence of the great master noticeable in DIDIER's early works. His last *envoi* from Italy, *Horace discovered by the Shepherds*, sent to Paris 1862, was purchased by Government for the Musée de Boulogne. The child-poet, covered by the leaves which doves have laid over him, has fallen asleep at the base of rocks surmounted by trees, through the branches of which light falls on the figures of the shepherds who discover the infant. The blue waters of the Mediterranean are seen in the far distance. DIDIER carried off a medal at the Salon of 1866 for two pictures; the subject of one is *Souvenir of the Lake of Trasimene*, and of the other *Labourage sur les Ruines d'Ostie*. In the latter, the primitive system by which land is tilled in the vicinity of the Italian capital is graphically rendered. Six teams of four oxen, guided by a *mercante di campagna*, are harnessed to ploughs which would amaze, if not enlighten, a Yorkshire farmer. Each consists of an iron shaft secured to a plate, on which a man stands in order that his weight should force the instrument into the soil. The artistic merit of the picture consists in the masterly drawing of the oxen, and the sense of slow movement given to the heavy animals who follow in procession round the field. Both these works were purchased by Government for the Luxembourg, where they now are. M. CABANEL, then in the zenith of his artistic career, on seeing the *Lake of Trasimene*, regretted that a second and separate medal could not have been accorded to it, on account of the luminous quality of the atmosphere in which the landscape is painted. In M. DIDIER's studio, 59 Rue de Vaugirard, there is but a single canvas besides the one on his easel, for the simple reason that his works are scattered over France. He was put *hors concours* in 1869 by *Entre Rome et Civita Vecchia*, an effect of evening sun on the coast-road, along which some magnificent dun cows are slowly returning from grass. JULES DIDIER's Italian subjects recall his contemporary OSWALD ACHENBACH's, so popular in Germany on account of the golden light which pervades them. Amiens purchased his *Castel Fusano*, and sent him its *diplôme d'honneur*, and Rouen his *Abreuvoir dans les Abruzzi*, which carried off the gold medal of the year.

In 1878 the City of Paris commissioned DIDIER to execute three large water-colour drawings of the principal promenades of Paris. The *Place de la Concorde*, the *Champs-Élysées* and the

*Bois de Boulogne*, and the *Parc des Buttes Chaumont* are the subjects he selected. They were exhibited at the Universal Exhibition, and, to M. DIDIER's extreme gratification, elicited marked approbation from H.R.H. the Prince of WALES, whose attention they were fortunate enough to attract.

In direct opposition to the impressionist movement of the day, JULES DIDIER, trained in the traditions of the school of which *POUSSIN* is the ideal, does not rest satisfied with the *à peu près* of a landscape half concealed by a hazy mist, through which the eye but dimly discerns the idea the artist wishes to render. He honestly expresses on canvas the sensation he himself experiences in presence of the scene he paints. Air freely circulates on his canvas, his scenes are admirably chosen, light and shadow are carefully distributed. His style is reminiscent of *PAUL BRIL*, whom he recalls by the delicacy and brilliance of his touch, as also by the truth and simplicity of the details in his foregrounds. In 1881 he carried off the prize offered for the decoration of one of the schools belonging to the City of Paris. By permission of the authorities the various drawings for the frieze of the buildings were reproduced in *The Architect*, and are, therefore, fresh in the memory of our readers.

His studio is of the simplest, and typical of the artist to whom it belongs. JULES DIDIER is utterly unconscious of his own superior talent, and, in speaking of the various distinctions which have been lavished on his works, he seems, with quasi-amusing simplicity, to apologise for their having been bestowed. Gladly he turns conversation to any other topic, even falling back to the somewhat threadbare siege, during which he and his friends, the sculptors *FALQUIÈRES* and *CHAPU*, served in the 19th Legion of the Garde Nationale. JULES DIDIER then lived in the Rue de Fleurus; a shell burst within one mètre of the wall of the house without injuring it, although the next building was shattered by the concussion. The one picture in his studio which recalls his life in Italy is of *Ostia*, which, it will be remembered, was the harbour of ancient Rome. In the course of centuries the sea has receded some miles, but the sandy quality of a sea beach remains and now forms the river-bank of the Tiber. On this beach Roman cattle have come to rest after their day's work on a farm. The water of the river reflects the white light of a winter sun. In the distance are ruins.

On the easel is one of the decorative panels on which M. DIDIER is at work for the Comte de CHABRILLANT'S *Château de Beauregard*. The subject is a French hunting-scene. The whipper-in, riding a powerful brown horse, is attired in a blue costume faced with red, and wearing a *cor de chasse* slung across his chest, of dimensions which would startle the most self-possessed M. F. H. who ever guided the fortunes of the Quorn or the Cottesmore. The hounds are cleverly drawn. The country across which they have to ride is more picturesque than pleasant. The subjects of two other panels for the same room are taken from the legend of St. HUBERT, who, it will be remembered, was a mighty hunter in his day, but somewhat profane as regards his manner of speech, habits, and customs. On one occasion he was using language not precisely canonical to his whipper-in, when, lo! in front of him, beneath the over-arched branches of oak trees, he saw a stag—a royal stag of ten—and between his antlers a luminous cross (whence proceeds the light in DIDIER's picture). Straightway, spite the brilliance of his crimson suit, on his knees fell St. HUBERT in the muddy forest-path, for it was mid-winter, and the Ardennes is a rainy district. He there and then vowed he would repent, which he proceeded to do by that night entering a convent (we conclude that he previously entered into arrangements as regards selling his stud of hunters), and the last history records of him is of his installation as Bishop of LIÈGE.

An architectural drawing in water-colours of buildings lately erected by M. PAUL SEDILLE, architect, at the angle of the Rue du Havre and the Boulevard Haussmann, not only reproduces the elegance of M. SEDILLE's design, but the *va-et-vient* of Paris life. The broad street is thronged, for it is mid-day, and the season is at its height. A bank messenger, in all the stately importance conveyed by his cocked hat and blue livery; *pieu-pieu* in *petite tenue*, their *képis* slouched over their faces, their blue jackets and red trousers somewhat loose for their wiry figures; *sergents de ville*, in their tight blue uniforms, stiffly surveying the hurrying crowd; a heavily-freighted omnibus, and a well turned out Victoria and high-stepping bay, conveying Prince FLEUR DU CHIC to the Jockey

Club, are admirably and characteristically detailed. Shade of *POUSSIN*! *Requiescat in pace*!

A delightful little picture a few inches square, *Shooting Wild Ducks among Reeds on the Banks of the Garonne*, on whose clear water the broad leaves of the *nenuphar* float, is a reminiscence of a pleasant day's sport. "Car," remarked the artist; "j'aime beaucoup la chasse."

## STUDIES OF SOME LONDON CHURCHES.

(Continued from page 17.)

THE Church of St. Luke, Canterbury Road, Kilburn, when the writer saw it, was on the outskirts of metropolitan civilisation, having a road on two sides of it, and nothing but fields beyond. It therefore rightly partook more of the character of a country, than a town church, notwithstanding the material of which it was built (brick), and had no lofty or impressive exterior. But it is vain to write of any church as rural bordering on that great gulf, London, which swallows up everything around it. The gabled bell-turret, instead of being planted at the west end or over the chancel arch, is on the south gable, which has not a happy effect. The ridge line of the nave and chancel roofs is continuous, there being a more ornamental cresting to the chancel, and a red pottery cross over the commencement of the latter. The porch is scarcely in good proportion. It has a roof of sharp pitch, but with a door of scarcely sufficient height for dignity's sake, though no doubt amply sufficient for all save sons of ANAK. The interior of the building is church-like, but a little extra height would have been an improvement had the funds permitted the additional outlay. The nave piers are octagonal, the sides of the cardinal points being longer than the four splayed sides; this plan changes into a square in the bell of the capital. The object of the arrangement is obvious. It saves, as far as possible, any cutting of the brick arches, which are thus able to run down to the top of the abaci. The former have a 2¼-inch square-edged reveal from the face of the wall, with a plain red brick label, and the inner order is also square-edged. Throughout the church every effort has been made to use uncut brick whenever practicable, as in the aisle windows, where there are no splayed inner reveals, but a sufficient width on each side of the sight line. So for all the practical purposes of spreading the light, the desired object has been attained. This square-edged reveal is of good depth, and seems a better treatment than a series of shallow brick orders one after the other, such as are sometimes employed. Even the corbels to the principal timbers of the nave are not of stone, but formed of over-sailing courses of brick, while in the chancel stone corbels are adopted. The nave roof has tie-beams and king-posts, with a polygonal panelled ceiling. The former appear somewhat plain and rude, neither moulded nor chamfered, and too nearly courting the remark of being hardly good enough for a church. There is a soffit above the cornice ranging with the front line of the bracket under the tie-beams. This consists of one long narrow panel between each truss, and could at any future time well be filled with tracery. The object of the architect in this arrangement of the advanced soffit to the cornice must have been to give greater apparent height to the nave, as, if the ashlar pieces above the tie-beam had been set in the ordinary way, the cornice must necessarily have been lower down. The east window consists of a lancet-headed triplet, without any cusps, enclosed in a large square-edged arch; the latter is carried on a brick pilaster, which, having a deep reveal, gives some considerable dignity to this end of the church, at the same time economising material. On the north side of the chancel is the prolongation of the nave lean-to aisle; on the south a gabled organ chamber, with vestry. The opening on the north side is an arch within an arch, presumably that it may better accord with the south side. The only distinction between the nave and the chancel is the raising of the floor of the latter, and the occurrence of a stone shaft supporting the hammer-beam principle, the former extending quite down to the floor. The central passage of the nave is happily of good width, a great point in a church where economy is evident along the whole line, and where, in other cases, false economy is often practised. It is laid with Portland cement, covered with cocoanut matting, and with a narrow edge of tiles. Taken altogether, this structure is a favourable specimen of an inexpensive church where dignity has been obtained.

The *Church of St. James*, Westmoreland Street, does not present any particular architectural character, though there has been a scheme for putting a good façade to it, published in one of the architectural journals some time since. Though the building is Italian in style, it has been treated in a kind of Byzantine manner, and decorated in colour. Unfortunately it has been too often the practice for architects in the case of churches to relegate Italian decorative work to the background and to attempt a sort of compromise. Now the writer has very strong notions as to the superiority of Mediæval architecture over Classic, but at the same time trusts he could restrain himself and not let his Gothic peculiarities run wild were he called upon to embellish or decorate in colour some Italian or Renaissance structure. "A place for everything and everything in its place," as well says the homely old proverb. At St. James's Church, semicircular arches have been added under the bearers of the gallery fronts, carried on responds attached to the main piers. The spandrels are filled in with semicircular arches. Embossed glass is used to the windows, the advantage of which is questionable, and one wonders what is the object just as much as in the case of pavements, for which during the last few years embossed encaustic tiles have been sometimes employed. In wall decoration such tiles offer a favourable opportunity for a variety of treatment, but in the tiles used for pavements a perfectly flat character seems best. The writer is not aware in Mediæval work of any precedent for embossing in glass. This is not necessarily a reason for "tabooing" it, but there was doubtless some good reason why our forefathers did not adopt it. For instance, dust and dirt are liable to collect in the interstices and so destroy the transparent character so all essential to glass, and sometimes so sadly ignored by the too lavish use of opaque enamels. Moreover, an irregular surface does not seem suitable to the material and gives it a heavy effect, while flatness in the glass spaces, where such flatness is natural, gives all the more emphasis to the general architectural lines. With this little explanation of the text taken from St. James's Church, the writer finds he has said all that is necessary about a church which is more celebrated for its pastor than for the material fold in which his sheep are gathered together.

The *Church of St. John*, Ashburnham Road, Chelsea, close by the site of Cremorne Gardens, is a specimen of a red brick building, and externally is of no special interest. The interior is more satisfactory, though the detail is not very refined. Perhaps the best feature of all is the mode in which the lower stage of the tower is used as a baptistery, and vaulted in red brick, banded at intervals with white brick. The tower being at the north side of the church, and standing independently, though semi-attached to it, is in an appropriate situation for the convenient use of its ground floor; the infants are thus well protected from cold and draught. On the west side of the tower is what, externally, appears to be an aisle, but is in reality the lobby and approach to the west gallery. The porch in the angle formed by the tower and the nave has a plain boarded ceiling, and in character appears scarcely good enough when near so elaborate a baptistery. The nave roof is of that form which of late years has become fashionable, though its character is rather un-English, resembling North Italian Gothic. The wood ceiling is trefoil-headed, but differs from the Italian form, as the upper foil is pointed instead of semicircular. Tie-beams and king-posts occur to the trusses, the former ranging with the point where the two foils meet. There is an advantage in this form of roof when the walls of a building for some reason are very high, and the pitch of the roof has to be rather flat; for by this kind of construction the ceiling can really be brought down some way below the plate. But in ordinary instances it is questionable whether much advantage is gained by adopting Continental peculiarities, when we have in England such an abundant store of Mediæval roofs, almost endlessly diverse in design. There is no chancel arch, and the roof of nave and chancel runs continuously from east to west, the length of the chancel being externally marked by a ridge cresting, with ornamental finial at its western limit. The windows of this church in general have plate tracery, a detail which, happily, is not so popular as it was a few years since. In our vernacular Mediæval architecture, about the period when this feature prevailed in France, there are scarcely any genuine examples of plate tracery, though the term is sometimes applied. Mistaken notions of manly vigour and force, simplicity, &c., led many men to prefer this crude cut-out-of-cardboard treatment to the far more refined though

equally simple Early English style. Though the writer has seen and studied the finest examples of Early French architecture, and knows how to attach proper value to many of its priceless beauties, yet he submits that in England we improved on the plate tracery when the Lancet style developed, and the succeeding magnificent style commenced. The arrangement of the two-bayed eastern aisle to the quasi-transept is rather picturesque. But it seems a mistake, while contriving the clerestory wall over the arches opening into the "transept," to have arcades closely resembling, not to say imitating, the clerestory windows. It would surely have been better if this plain, unpanelled piece of wall had been left to tell its own story and serve as a foil to its ornamental surroundings, as has been well done at another church in the west of London (St. Mary Magdalene's, Paddington), the design of one of our most eminent architects. There is a west gallery at the end of the nave, but it has not been treated as an integral part of the building, and has the too-frequent semblance of an after-thought, whereas it was constructed simultaneously with the rest of the church. It is invidious to make comparisons, but one need not wander very far to find some good examples, in this city, of west galleries which do not by any means detract from the monumental appearance of the buildings in which they have been set. Speaking from the point of view of a Churchman, and putting aside for the nonce architectural ideas, a gallery in a church is a mistake, and should always be protested against. In fact, instances in the present day are few and far between of galleries being built. On the contrary, one more commonly hears of their being pulled down. But occasions will arise when architects are called upon to make the best they can of features they rather deprecate. "Where there is a will there is a way," and the writer is convinced that, by a little study, a western gallery, with a circular or octagonal staircase made a feature of externally, and designed so as to be as easy of ascent and descent as possible, might be made picturesque rather than otherwise. There are two desks facing west, at the nave end of the chancel seats, the one on the south side being rather higher than that on the north, and with a brass desk, as it serves for a pulpit. This is unusual and seems a distant re-echo of the ancient basilican arrangement of ambones. It is a rather remarkable feature to find in a church where Evangelical teaching prevails. Within the last few years the idea of a basilican plan, which was taken up by the High Church party, has not gained much ground in that quarter, but has reappeared in buildings where the ritual is of a far less advanced type, as at St. Augustine's, Stepney. There are evident signs that the pulpit is not considered by the clergy so essential a feature as it used to be. It has gradually diminished in height, and in "Ritualistic" churches would appear to be thought of small account, as for years, flimsy, modern, makeshift structures, of an apparently temporary nature, rear their heads unabashed. A feature of a very utilitarian nature exists in this church—a brass drop-ring handle, outside the bench ends, to hold umbrellas, with a little metal pan under. In this rainy climate it is not unfit that in a large church some provision should be made of this nature, as it renders the building less uncomfortable for worshippers, as everyone who has come into church with a dripping umbrella must acknowledge.

(To be continued.)

### THE ENGINEERING EXHIBITION.—III.

AT the stand of Messrs. ENGERT & ROLFE, Barchester Street, Poplar New Town, E., the varieties of asphalt and bitumenous felts manufactured by this firm for all purposes of roofing, whether for houses or outbuildings, lining roofs and covering temporary sheds, lining damp walls, iron houses, and also as effective damp courses in foundation walls, for all which purposes it proves a handy and inexpensive material, were exhibited.

The tastefully-arranged stand of Messrs. MAPPIN & WEBB, Oxford Street, W., and Mansion House Buildings, E.C., did not fail to attract attention, forming as it did a striking contrast with neighbouring exhibits bearing on the construction of houses. When the house is finished it has to be furnished, and it will not be the fault of the firm if a client cannot satisfy himself with the articles produced by Messrs. MAPPIN, whether in the way of artistically-executed plate, candelabra, clocks, and matters of more ordinary detail in regard of household economies.

Messrs. JEAKES & Co., of Great Russell Street, Bloomsbury, showed their patent self-reversing steam washing machine, an invaluable invention for hospitals, workhouses, asylums, &c., and the patent "Invicta" ironing machine, which is no less valuable for efficiency in execution and for saving of time and labour.

Messrs. GEORGE RICHARDS & Co., Atlantic Works, 12 City Road, Manchester, exhibited their sawing and planing machines; among them a cross-cutting and ripping saw combined in one machine; a combined power and hand-feeding planing machine, with power to feed 18 inches wide and 4 inches thick, and supplied with various patent improvements. A comparatively new article offered to the public, and which appears to have found favour, is the patent hand-feeding planing machine. It is used for planing the surfaces and edges of timber of any size, without alteration of the machine. The cutter head revolves below the tables, and the wood is held down and fed by the hands. The tables, both before and after the cutter, are adjustable vertically, to regulate the depth of cutting, while, by means of automatic stops, the tables cannot be brought in contact with the cutter-block as their heights are altered. The machines are complete with cutters, adjustable bevel gauge, counter-shaft, and wrenches. Also shown were the improved steam glue-oven, band-sawing machine, pulley-balancing machine, &c.

Messrs. LEWIS OLRICK & Co., Salford Ironworks, and 27 Leadenhall Street, E.C., showed their well-known earth-boring tools, "Root's" pump, "Field's" boiler, "Blake's" latest improved patent stone-breaker, &c. The "Root" pump, which was to be seen working, differs from the ordinary rotary-pump, as well as from the centrifugal. It consists of two vanes, revolving in a casing in opposite directions. These vanes or abutments are formed in such a manner that a kind of rolling contact is kept up between them, rendering them practically watertight. As each vane revolves on its centre, one-half forms a vacuum between it and the outside casing, into which the water flows as the motion is continued; the opposite end coming round drives the charge already taken in before it, at the same time creating a vacuum behind it, which in turn is filled with water and discharged at the next revolution. The continual charging and discharging goes on simultaneously with both vanes, hence a constant flow is the result. Water may be drawn by suction from a depth of 28 feet, at either high or low speeds. It is chiefly intended for discharging very large quantities at low lifts, up to 50 or 60 feet, for instance; and hence it is especially adapted to the requirements of breweries, irrigation and drainage works.

Messrs. CAYLEY & CAYLEY, Brockley Street, Golden Lane, agents for Messrs. J. A. FAY & Co., U.S.A., had on view the patent hand and power feed surface-planer, variety wood-worker, edge moulding and shaping machine, patent band-sawing machine, &c.

Messrs. RICHARD HORNSBY & SONS, Limited, Spittlegate Ironworks, Grantham, showed a 20 horse-power compound steam-engine, fitted with multitubular boiler to carry a working pressure of 140 lbs. per square inch; a 25 horse-power high-pressure stationary horizontal steam-engine, for working a pressure of 80 lbs. per square inch; and a 3 horse-power vertical engine and boiler combined, and arranged on a vertical column with a double-ended crank, so that the power can be taken off either side.

Messrs. THOMAS ROBINSON & SON, Limited, Rochdale, showed various descriptions of wood-cutting machinery, and among them the universal wood-worker should prove a most useful machine. It can be used for planing, jointing, and trying-up short lengths, also for morticing, boring, and sawing, tonguing, grooving, and rebating. For planing, jointing, and trying-up, the timber is fed by hand over a cutter-block, capable of planing any width up to 12 inches. The tables above the cutterblock are made adjustable, so that as they are raised or lowered they approach or recede from the cutters, so as to keep the opening through which the cutters project as narrow as possible, and avoid any accident through their coming in contact with the tables. It is fitted with a canting fence and pressure rollers for holding down the timber. One end of the cutterblock spindle is bored to receive a boring bit, and is used for morticing and boring. The other end is arranged to carry a small saw 15 inches diameter, and fitted with rising and falling table. The saw can be replaced by a small cutterblock 2 inches wide, and used for tonguing, grooving, rebating, beading, &c. Also shown were a self-

acting grinding machine for sharpening long planing-irons, a small power morticing machine, a combined hand and power feed planing machine, &c.

Messrs. ALEXANDER SHANKS & SON, Dens Iron Works, Arbroath, and 27 Leadenhall Street, E.C., showed a patent compound double-acting vertical steam-engine, which is intended to effect a great saving in fuel. The form of the engine is simple. The working parts are few in number, and easily got at for lubrication, and all parts liable to wear are constructed so as to be adjusted without difficulty.

Messrs. W. H. BAXTER & Co., Albion Street, Leeds, exhibited their stone-breaking and ore-crushing machines, the patent knapping-motion stone-breaker, with improved screen, and others. The firm state that during the past year their sales have by far exceeded their expectations, and to meet the demand they have had to increase their means of production. Every machine supplied is guaranteed to break a stated quantity of stone, pyrites, granite, ganister, slag, boulders; also copper, tin, lead, and other ores. In some materials the machines are said to be breaking nearly double the quantity specified, and by the patent knapping-motion the quantity broken can at any time be increased without increasing the size broken to, no other machine having this advantage.

Messrs. T. WILSON & Co., Stowmarket (Messrs. G. F. SUTTON & Co., 100 High Holborn, agents) showed their protected alkaline composition for removing paint and varnish from wood, iron, and metal work, &c. The composition is effective and speedy in working; a few minutes after application the paint can be wiped away, giving a clear surface with nothing injurious left behind. Where time and labour are required to be economised nothing could be more effective.

Mr. W. H. HARLING, 40 Hatton Garden, had a tasteful display of mathematical, drawing, and surveying instruments, of excellent finish and workmanship. An improved horizontal-compass is designed to obviate, as in the use of beam-compasses, too much weight being allowed to fall upon the pen. The horizontal-compass resembles the ordinary beam-compass, with the addition of a joint in the middle, to which is attached a support running upon a small wheel, taking the weight from the point and pen. By setting the two arms of the beam at various angles small circles can be drawn, and by stretching them out in a straight line circles of the largest radius can be described.

Messrs. THOMAS & WILLIAM SMITH, St. Lawrence Rope Works, Newcastle-on-Tyne, showed various descriptions of hemp and wire ropes, their patent steel ropes of special construction for suspension bridges, for raising heavy loads—breaking strains for which are guaranteed up to 400 tons—also copper rope for lightning conductors, &c.

Messrs. VERITY & Co., Bramley, Leeds, showed their patent flexible shaft couplings, particularly suitable for vessels, &c. Shafts thus coupled together are rendered flexible in such a manner that they will adapt themselves to any irregularities in the line of bearers; and, whilst retaining all the qualities of the rigid shaft, they will transmit the rotary movement from the engine to the propeller evenly and rigidly, under all circumstances, without loss of power.

The Bower-Barff Rustless Iron Company had on view articles in ironwork of various descriptions, rendered rustless by the Bower-Barff process, and besides pipes, gutters, sanitary castings, &c., showed ornamental ironwork similarly treated, medallions, figured reliefs, vases, statues, ornamental brackets, railings, &c.

Messrs. FELTEN & GUILLEAUME, represented by Messrs. W. F. DENNIS & Co., 101 Leadenhall Street, exhibited iron and steel wire of all kinds for fencing and telegraph purposes, electric lighting, &c. The Indestructible Paint Company, Limited, 27 Cannon Street, E.C., displayed their preservative paints and invisible preservative solution.

Messrs. CHARLES CHURCHILL & Co., importers of American machinery and tools, exhibited an extensive assortment. The firm are the sole agents for the genuine MORSE's patent American twist drill, the only American drill made with grinding-line. We may also mention the BROWN & SHARP's gauges, calipers, and straight-edges for the use of architects and draughtsmen.

LLEWELLIN's Patent Machine Company, Castle Green, Bristol, and Bath Street, Glasgow, showed their time-checking machines, brass-finishing lathes, CLYNE's patent sight-feed lubricators, rotary steam-engine, &c.

Mr. JAMES KEITH, High Street, Arbroath, among his

exhibits showed a No. 1 c sectional boiler heating 100 feet, the cost of the apparatus being 5/. No. 2 c will heat 300 feet. The KEITH'S sectional boilers are made in prices to suit the requirements of the purchaser, and a shaking grate, which saves riddling the ashes, is an improvement just introduced. No. 1, alluded to above, is being sold as fast as the firm can supply the orders.

MESSRS. LLEWELLYNS & JAMES, Bristol, are known as the sole makers of CLEMENTS' patent economic lubricator, and showed their steam boiler and engine mountings, pumps, water-works' fittings, plant for brewers, &c. The firm state that there is a steady and increasing demand for the lubricators, both for marine and land engines, and which are guaranteed to effect economy in grease, power, and wear.

MESSRS. ARCHIBALD SMITH & STEVENS, James Works, Queen's Road, Battersea, and Leicester Square, showed the complete self-sustaining double dinner-lift in action, which are said to possess, among other improvements, all the advantages and security arising from the principle of automatic suspension.

MESSRS. HOLDEN & BROOKE, St. Simon Street, Salford, showed a self-acting portable drilling-machine, designed to work inside a boiler shell, and to drill two holes diametrically opposite at the same time; also a one-half-horse vertical gas-engine. MESSRS. DEAKIN, PARKER & Co., Sandon Engine Works, Salford, had on view a half-horse-power Sandon gas-engine; MESSRS. GREENWOOD & BATLEY, Albion Works, Leeds, a patent hand-power rock drill for quarrymen and contractors' use, &c.; Mr. E. S. HINDLEY, Bourton, Dorset, a No. 2 circular saw bench, with band saw apparatus and arrangements for tenoning, boring, and spoke-ending; small vertical engines and boilers, &c.

MESSRS. ANDERSON & HUNTING, Bath Lane, Newcastle-on-Tyne, who received a silver medal (highest award) at the Tynemouth Exhibition, 1882, exhibited their patent automatic dovetail and variety moulding machine. The cutter for forming the dovetail is fixed in a vertical spindle, and is of simple construction. The machine can be converted in a few minutes into a single spindle irregular or circular moulding machine, for moulding, tonguing, grooving, rebating, bevelling, plain and stop chamfering, &c. The improved surface-planing and thicknessing machine was also on view.

MESSRS. W. & T. AVERY, Digbeth, Birmingham, had a 10-ton self-contained wagon weighbridge, with patent self-recording steel-yard. Weighing machines, scales, and balances of various descriptions completed the exhibit. The firm are at present executing an order of 8,000 balances for the new parcels post authorities. Machinery for wood-working, sawing, planing, and moulding, &c., were shown by MESSRS. F. W. REYNOLDS & Co., Edward Street, Blackfriars Road; various descriptions of pumps and pumping machinery by MESSRS. F. PEARN & Co., West Gorton, Manchester; "Reliance" air compressors, and "Eclipse" rock drills, stone-breakers, tramway material, &c., by MESSRS. HATHORN & Co., 22 Charing Cross; and a variety of gas engines by the British Gas Engine and Engineering Company, Limited, 11 Queen Victoria Street; by Mr. JAMES SINCLAIR, 104 Leadenhall Street, MARTIN'S patent rotary pumps, driven by hand and by pulley, "Fire Queen" and "Express" fire engines, &c. MESSRS. JOHN WHITE & SONS, Park Road Tannery, Bingley, have now a representative in London, and had at the exhibition samples of their leather machine bands, manufactured without use of chemicals.

#### PARIS NOTES.

A NOVEL undertaking, both complicated and difficult in execution, has been lately commenced at the Paris end of the Asnières railway bridge. The work in question consists in removing a portion of the immense embankment upon which the lines now rest, and replacing it by an iron arch, under which will pass the new high road now in course of construction along the right bank of the Seine. The difficulty of the operation consists in the fact that the railway traffic over the bridge, which is daily crossed by a greater number of trains than any other in the country, is not to be interrupted for a single day. The length of the new viaduct will be 50 feet, the work being executed in two sections, the first of which consists in piercing two parallel galleries to receive the side pillars of the bridge, and the second in removing the central mass of earth after these pillars have been built up. The work cannot be terminated before next spring, and is being

executed by the Western Railway Company on behalf of the Department of the Seine.

The decorative sculptures for the interior of the new Hôtel de Ville are being rapidly pushed on, and during the past week several important orders have been given out by the Prefect, acting upon the advice of the Fine Arts Committee of the Municipal Council. Thus M. Chapu, whose only work hitherto for the Hôtel de Ville has been the statue of Hérold, the composer, for one of the outside niches on the first floor of the principal façade, has received a commission for two marble statues, to be placed in the grand dining-hall; while M. Idrac, the victor in the late Etienne Marcel competition, and M. Crauk have each secured an order for a marble statue for the same room. The execution of the stone busts to be placed on the bottom landing of the grand staircase has been confided to M. Delhomme, and M. Longepied will carry out the allegorical bas-reliefs for the Cour des Bureaux. The total amount of their orders is 70,000 frs. Nothing has yet been decided upon in reference to the execution of the decorative paintings, frescoes, &c., M. Ballu, the architect, having as yet laid no proposition on the matter before the Council.

At the last meeting of the Commission des Monuments Historiques it was decided to spend 309,500 frs. upon the repairing and preservation of the following: the fortifications of Carcassonne (Aude), the churches of Saint-Georges de Boscherville (Seine-Inférieure) and of Manzon (Ardennes), the old cathedrals of Dol (Ille-et-Vilaine) and of Tréguier (Côtes-du-Nord), the Courthouse of Dijon (Côte-d'Or), and the church of Saint-Martin d'Aime (Savoie). The commission classed as historic monuments the church of Aregno (Corsica), the Zaouia of Abd-er-Rhaman and Talbi at Alger, the Moorish baths of the thirteenth century at Tlemcen, and the old fortifications, including the Mansourah Gate of same town.

A resolution has been passed calling upon the authorities of the church of Saint-Rémy at Rheims to take proper steps for the preservation of the celebrated tapestries contained in that edifice, now hung in a dark and inaccessible passage, where they drag the ground, and are being rapidly eaten into by the damp and dirt; and the commission further urge that arrangements should forthwith be made to provide for the free admission of the public at convenient hours to the old cathedral of St.-Denis, which has lately been restored at great expense to the nation, and turned into a veritable museum of antiquities.

On the recommendation of the Minister of Public Instruction and Fine Arts, the following nominations of members of the art-world have just been made in the Order of the Légion d'Honneur: Officers—MM. Galland, painter, professor at the National School of Fine Arts, and La Rounat, manager of the Odéon Theatre; Knights—MM. Dalou, sculptor, who carried off the Médaille d'Honneur in the sculpture section of this year's Salon; Roll, painter; Gruyer, conservator of paintings at the Louvre; Dutert, architect, inspector of instruction in design; Pisan, engraver; Morice, sculptor of the great *Statue of the Republic*, inaugurated on the 14th inst.; Alègre, conservator of the Bagnols Museum and Library; Dasson, manufacturer of art bronzes, and member of the jury at the 1882 Exhibition of Decorative Art.

After seventy-two days' work the competitors in the painting section of the Grand Prix de Rome quitted their *loges* on Tuesday last. The subject given was *Edipus Cursing his Son Polynices in the Presence of his Daughters Ismene and Antigone*, and the ten competing artists, whose works will be exhibited at the Ecole des Beaux-Arts, have been placed in order of merit as follows: 1. Pinta, pupil of M. Cabanel, 2nd Grand Prix of 1882—born in 1856; 2. Lambert, pupil of MM. Cabanel, Bin, and Lequien—born in 1854; 3. Tollett, pupil of M. Cabanel—born in 1857; 4. Castaigne, pupil of M. Gérôme—born in 1861; 5. Roy, pupil of MM. Boulanger and J. Lefebvre—born in 1853; 6. Friant, pupil of M. Cabanel—born in 1865; 7. Charpentier, pupil of MM. Bouguereau and Tony Robert-Fleury—born in 1858; 8. Baschet, pupil of MM. J. Lefebvre and Boulanger—born in 1862; 9. Millochan, pupil of MM. Cabanel and Feyen-Perrin—born in 1856; 10. Pichot, pupil of MM. Cabanel and Bertrand, 2nd Grand Prix of 1879—born in 1857. The definitive judgment, which is based not only upon this part of the competition, but also upon the performances of the ten artists in the two previous stages, will be made known on the 28th inst.

In the half-yearly sculpture competition at the Ecole des Beaux-Arts, third medals have been awarded to M. Dubut, pupil of

MM. Dumont and Bonnassieux, and to M. Larche, pupil of M. Falquière; while in the medallion competition from the antique a second medal was obtained by M. Deman, pupil of M. Cavelier, and third medals by M. Brincourt, pupil of M. Cavelier, and by M. Belloc, pupil of MM. Dumont and Bonnassieux.

The late M. Coutan, a well-known collector, on his deathbed expressed a wish that several of his paintings should be presented to the Louvre. In accordance with this desire, his heirs, M. and Mdme. Milliet, requested M. de Ronchand, Director of the National Museum, to make his own choice out of the numerous works contained in the collection, and that gentleman has selected *La Chapelle Sixtine*, by Ingres; a *Christ*, and an *Allegory representing the Marriage of Napoleon I. and Maria Louisa*, by Proudhon; and two paintings by Géricault.

## BRISTOL AND CLIFTON JUNIOR ARCHITECTS' SOCIETY.

THE council and members of the above society met at the Fine Arts Academy, Queen's Road, Clifton, on the 13th inst., the principal object being the distribution of prizes to the successful competitors. Mr. J. C. Moncrieff presided, in the absence of the mayor of Bristol. The chairman, in presenting the prizes, said that it was customary to make a review of their position, the work done, the losses the society had sustained, and the advancement of architecture. The object of the association was that its members might work in harmony with the interests of the world, and that art might be more widely practised, better understood, and more admired. There had been of late years a tendency to devote more time to science than to art, and all must be fully aware that the art of building, &c., did not admit of perpetual discussion. The country-house built in the last century was not to be compared with the houses built nowadays. The builder of the present day sacrificed his money to place "gimcrack" ornaments in front of the building, and these were costly to keep in repair. The floors of the houses were so thin that sounds could be heard echoing from one floor to another, and the stormy breezes found their way through the small crevices. In former days they found mansions built with simple good taste and solidity. As a society they were indirectly responsible for building. How many of them were brought up to the idea that all buildings ought to have a good front! It was true that this question should receive more discussion and action. One of the fundamental principles of architecture was that it should be solid before ornamental, for ornament could not be applied to a building like the loose-fitting garments of the present day, to cover defects that were not supposed to be seen. How many inventors claimed that their inventions were cheap, and occasionally convinced them they were lasting? Let them look at the architectural buildings in the ancient city of Bristol, and compare them with the buildings now being erected with lumps of terra-cotta and highly suggestive chimney-pots. Were they what builders of the last century would erect? No doubt a constant and vigilant influence, checking with authority all that was bad in art, and showing favour to all that was good, would have a beneficial effect; and examples of solid, tasteful, and simple works might exercise an influence indirectly towards the chastening of taste. He might mention that that was the first year for obligatory examinations for admittance to membership of the Royal Institute of British Architects. The examinations had been made to raise the standard of education, and so keep out those who were wholly incompetent. They were inducements only to those hard-working and industrious students in the shape of prizes, and could only be gained by those who had achieved artistic excellence. He was pleased to inform them that the University had undertaken to deliver a course of lectures on the history of architecture, and they had appointed Mr. W. E. Jones, of Bristol, as lecturer, who, as they were aware, was well versed in the higher branches of the profession, and he sincerely trusted the students and members of the society would avail themselves of the opportunity of obtaining a thorough grounding in the science and art of building, which was the only means of making them proficient in their profession. There was, however, only one controlling influence, which all of them ought to make it their best endeavour to educate, according to their strength and means, namely, public taste. There were two classes in the society, the old and the young, and in the former he regretted to see many absent. The younger members were trying to work in a groove which ran parallel to their seniors, and he could not see why some means might not be devised for enabling them to do so. He felt that in the energy with which they pursued their work, and the high excellence of much of it, surely some plan could be devised amongst them. In doing so he hoped that they might not only be able to work together but also to be represented at the Council or Royal Academy as was suggested by the late president of that Institution.

Several new members having been elected, the chairman distributed the prizes in accordance with the subjoined list:—

COMPETITION No. 1.—*Measured Drawings*.—For prizes given by the council of the society and Mr. Joseph Wood (vice-president), to the members producing the best and second best sets of drawings, plotted from actual measurement, of any one edifice chosen from a given list—First prize, W. F. V. Francis, subject, entrance to Chapter House, Bristol Cathedral; bracketed equal in merit for second prize, F. E. L. Harris and H. T. Edwards, subjects, Norman Gateway, College Green, and Elder Lady Chapel, the Cathedral; extra prize, George E. Ford, subject, Elder Lady Chapel, the Cathedral.

COMPETITION No. 2.—*Essay Prize*.—For prize offered by the council of the society for the best architectural and historical description of any one of the buildings visited by the society during the year—Awarded to William E. Hill; subject, Bristol Cathedral.

COMPETITION No. 3.—*Design*.—For prizes offered by Mr. Wm. L. Bernard (vice-president) and the council of the society for the best and second best designs for a provision warehouse—First prize, William H. White; second prize, F. E. L. Harris.

Competition for prizes given by Messrs. J. Nicol Smith and Joseph Wood for the best set of drawings, plotted from actual measurement, of the doorway to Spicer's Hall, Welsh Back—First prize, William H. White; second prize, H. J. Edwards; extra prize, William Jane.

On the motion of Mr. W. E. Hill, seconded by Mr. W. H. White, the thanks of the meeting were given to Mr. Moncrieff for presiding. The chairman briefly returned thanks, and moved a vote of thanks to Mr. W. E. Jones for his kindness in looking over the drawings, and making selections for the different prizes. No one better qualified could have been selected for the work. He also proposed a vote of thanks to the donors of the prizes. Mr. Hill seconded the motion, which was agreed to.

## PUBLIC IMPROVEMENTS IN EDINBURGH.

THE eighth annual report of the Edinburgh Cockburn Association has been published. In it the Council of the Association deal with various questions of city improvements. In regard to the site of the old Infirmary, the Council say they are strongly impressed with the conviction that the opportunity, so seldom afforded, of acquiring an open space in one of the most densely populated quarters of the city, should not be lost, but that the site should be laid out as a public garden or recreation ground. The immediate neighbourhood suffers much from overcrowding and want of ventilation, while the attractions of the University would be enhanced by there being a garden either in front of it or at no great distance from it. In regard to the proposed bridge at Bell's Mills, the Council say they would view with alarm any proposal to widen the Dean Bridge—a process which could scarcely fail to injure that beautiful structure—and they believe a new bridge to the west of the present one would be much more suitable, affording as it would do a direct access to the grounds of Trinity Hospital at Blinkbonny, which the Council hope may one day be made available to the public in some form or other. They are of opinion that too little has been done in the way of supplying public parks, and suggest that, if Edinburgh had a public park at Blinkbonny, it could not fail from its situation to become one of the most charming spots in or around the city. The Council have ascertained with satisfaction that the feuars in Douglas Crescent and Belford Park have obtained a right of servitude over the ground in the intervening valley, which is to be laid out by the proprietor, Mr. Waddell, as a tastefully-arranged pleasure ground. While rejoicing that so much has been recently done to improve the city by planting along the streets, in the Meadows, and elsewhere, they again suggest that the line of trees in Princes' Street should be continued past St. John's Chapel. As to the proposed covered rock garden in West Princes' Street Gardens, the Council requested the municipal authorities to postpone their final determination until a more decided expression of public opinion should be elicited by public exhibition of the design of the proposed structure or otherwise. The Council are not aware that anything further has been done in reference to the proposal. The Council regret that the municipal authorities have not been able to see their way to acquire the strip of ground lying between the south boundary of the Arboretum and the Water of Leith, a result the more to be regretted, as the ultimate feuing of the ground in question will undoubtedly injure to a great extent the beautiful views of the city now to be obtained from the Arboretum.

The Town of Darlington has adopted the Free Libraries Act, and Mr. G. G. Hoskins, F.R.I.B.A., has been appointed by Sir Joseph Pease and Mr. Arthur Pease, the executors of the will of the late Mr. Edward Pease, to design and carry out the new library buildings.

## NOTES AND COMMENTS.

THE annual meeting of the Gloucestershire Archæological Society is to be held in Bath on the 25th inst. and two following days. There is an interesting programme. The proceedings will be opened by the reception of the Society at the Guildhall by the Mayor, after which the president will deliver an address. The Roman bath will be examined under the guidance of Major DAVIS, who is entitled to be called its discoverer. There will be a carriage excursion to Hampton Down, where, under the guidance of Prebendary SCARTH, the camp and the Wansdyke will be examined, and the chains of camps on either side of the Avon, with the ancient boundaries, fords, and roads. An evening meeting will be held at the Guildhall for reading and discussing papers, and there will also be a temporary museum. Thursday will be devoted to a carriage excursion to Little Sodbury and Dyrham, going up the Avon Valley along the line of the Foss-Way over Bannerdown, passing the "Three Shire Stones," and thence by the head of St. Catherine's Valley to Marshfield Church, Cold Ashton (church, parsonage, and manor-house), and Little Sodbury (camp and manor-house); returning to Dyrham (battlefield of Deorham, church and house), and through Dyrham Park over Lansdown (battlefield and camp) to Bath. A *conversazione* will be held at the Guildhall in the evening. On Friday, after a concluding meeting at the Guildhall, the members will proceed by special train for Thornbury (church and castle), calling at Iron Acton (church and cross).

THE annual meeting of the National Smoke Abatement Institution was held (as reported in another column) on Monday. The Lord Mayor, on the occasion, remarked on the improved atmosphere of the City during the last few years, now that City buildings were not so much used for dwelling-houses as formerly. It is not to be imagined that every Londoner can be expected to dispense with fires in his house while the knotty question of the efficiency of various types of heating and cooking machines, from coal-burning grates, stoves, &c., to gas apparatus, &c., is being solved. This is a work necessarily of experiment and time, and will, no doubt, be satisfactorily solved, if undue haste is not made in attempting too much with too little experience. What can be done, and should be done, is that measures should be taken to stop the volumes of smoke that are discharged into the London atmosphere as, we may say, a commercial speculation. Owners of factories, and such like, are not the only offenders. For one factory there are legions of bakers' and cooking establishments, hotels, &c., which play a very good second to any factory in the blackness and volume of smoke they emit. As these people make a handsome profit out of the public, they ought to be forced to consume their own smoke, or pay some very solid remuneration to the public in the way of fines, rather than be allowed to poison people and get well paid for so doing.

THE Criterion Theatre, Piccadilly, is to be lighted throughout with about 600 EDISON incandescent lamps. The generating plant will comprise two ARMINGTON and SIMS' horizontal high-speed engines, having 13-inch cylinder by 13-inch stroke, running at 275 revolutions per minute, and driving on to countershafting, from which will be run four EDISON L-dynamos, each capable of sustaining 150 16-candle lamps. Each engine will be capable of indicating 84 horsepower at 70 lbs. pressure, and either engine will thus be able to take the whole load in the event of accident or repairs to the other. The wiring will be arranged on eight circuits, each under independent control, by means of a specially-designed regulator capable of lowering or raising the brilliancy of the lamps from normal candle-power to *nil*. The contract for the work, which will be carried out by the Edison Electric Light Company, Limited, stipulates for the completion of the installation by the beginning of September.

BUILDING amenities have once again been a subject of notice by the Solihull Rural Sanitary Authority. At a meeting of this body on Wednesday Mr. T. W. WHITLEY, C.E., submitted a report on some buildings erected by Mr. KENT, a member of the Board, at Olton. Mr. WHITLEY said on examination he found the foundations and footing of the buildings to be contrary to the by-laws, the walls being built other than upon solid ground, and upon an artificial foundation made up of loose materials not suitable for the purpose. These materials con-

sisted, not of concrete, but of a very large preponderance of wet red sand, with a large proportion of lime riddlings, not mixed thoroughly together, having no binding properties, and being loose, damp, and so soft that it was most easily got from under the footings of the walls with a common walking-stick. The underpinning was awkward, dangerous, and unsatisfactory. Mr. WHITLEY pointed out in conclusion that in a similar case a heavy fine had been inflicted. Mr. KENT, as was natural, did not see the matter at all from the same point of view as Mr. WHITLEY, and considered there must be some ill-feeling on the part of the surveyor towards him. The chairman, however, having gently recalled Mr. KENT to order, that gentleman eventually consented to put concrete under the foundations, and if that did not, in the opinion of the surveyor, render the buildings secure, to take them down and rebuild them. Less than this Mr. KENT could hardly have done, though, considering his official position, he would have been wiser in the first instance not to have transgressed the laws which he has been appointed to uphold.

THE advantage of concrete as a fire-resisting material is shown by statistics of the Paris Fire Brigade during the past year. It appears that 982 fires were dealt with during that period by the Paris firemen. Of these 696 were of more or less trifling proportions, involving only single rooms, doors, &c.; 267 of greater gravity, such as workshops, building yards, and warehouses, while no more than 19 would be regarded as being serious. The estimate of the losses in 977 cases of fire was 7,729,315 frs., of which 7,590,100 frs. were the result of 274 fires in which the average loss amounted to 27,701 frs. per fire. For 703 other fires the loss was 139,215 frs., or an average of 198 frs. per fire.

It may seem somewhat remarkable to find a Duke appearing in a police-court, but as such a court is the special tribunal for cases under the Metropolitan Building Act, and as dukes own property in London, there need be no surprise. On Wednesday the Duke of BEDFORD was summoned to Bow Street to pay district surveyors' and other fees. Some stables belonging to His Grace, in the parish of St. Pancras, were about to be removed, when the district surveyor telegraphed to the contractors that a hoarding must be erected. Afterwards he reported that the stables were "dangerous," and the Duke was called on to hoard them in taking them down, and before this could be complied with, the hoarding was erected at the instance of the surveyor by the Board's contractors. When the case was heard it was shown by counsel, on behalf of the Duke of BEDFORD, that the building *per se* was not a "dangerous structure" within the meaning of the Act, and that any question of hoarding during the pulling-down was governed by the Metropolis Local Management Act, and not by the Building Act; that all proper care and precautions were taken, and that the district surveyor had mistaken his functions in ordering the Board's contractor to hoard in the building. The magistrate was of the same opinion, and the summons was accordingly dismissed.

A DECISION of Mr. Justice MATHEW shows that all the judges do not consider the angle of forty-five degrees to be indispensable to equity in light and air cases. The owner of a coffee-house in Rotherhithe Street took an action against a firm who are erecting large works on the opposite side of the street, which is only 21 feet wide. The coffee-house was not of imposing height, and it was claimed that a low light was of greater value than is usual. The new wall of the opposite premises is 13 feet 6 inches higher than the old wall. After hearing evidence, the judge was of opinion that there was injury, and damages of small amount were awarded.

A NEW description of writing-paper has been issued by Messrs. WALKER & Co., of Farringdon Street. The novelty consists in the imitation of the so-called crocodile leather, and other varieties resemble morocco and Russia leathers. The material, considered simply as paper, is far superior to the best writing papers. It is of good colour, is smooth in surface, besides being thick. But there is a want of fitness in paper which imitates leather. Parchment and vellum are of use for deeds, but they are different in texture from the leather which is prepared by curriers. The inventors could have found a grain far more suitable among the plant forms. There is, too, an objection in the crocodile pattern, inasmuch as it is difficult to write in straight lines over the indentations.

## ILLUSTRATIONS.

DESIGN FOR THE ITALIAN MEMORIAL OF VICTOR EMMANUEL.

WE publish this week an illustration of the design which was submitted by Mr. DANIEL BRADE, F.R.I.B.A., of Kendal, in the competition for the National Memorial of King VICTOR EMMANUEL. It was one of the designs to which a gold medal was awarded. A drawing of the design is in this year's exhibition of the Royal Academy.

The following is a translation of the report which Mr. BRADE sent with his design:—

"In submitting herewith the accompanying design for a memorial to the late King VICTOR EMMANUEL II., I would add a few words in explanation of the design. As will be seen, it is proposed to construct a bridge across the Tiber, at or near the locality of the ruined Ponte Sublicius. The bridge would be flanked by triumphal arches at each end, and with colossal groups of statuary (varied), and along the bridge on both sides, double colonnades vaulted at top, the central portion forming a grand cortile or larger loggia. I would enrich the faces of the triumphal arches, and the friezes and spaces suitable, with statuary, sculptured decoration, inscriptions, and names of illustrious men and women of Italy—both ancient and modern—the form and nature of the structure being designed specially for and adapted to this purpose. The bridge and arches throughout and the abutments and river walls to be in stone, and the faces in Travertine stone, the columns of the triumphal arches in marble, and the capitals in bronze. The bassi reliefs in bronze or marble of varied colours.

"As to the estimated cost, it will be judged from the nature of the memorial that it need not be carried out in its entirety, as to statuary and sculpture, at once. The large groups of statuary and decorative features can be erected in materials more or less costly, from time to time as funds permit, and they may be devoted partly to the commemoration of *future* notabilities and events of Italian history. But taking the work as herein indicated complete, with its pediments, cornices, coffered soffits, festoons, columns, and all architectural and sculptured carving (as apart from the human figure), I estimate the cost at 7,500,000 Italian lire, or 300,000*l.* sterling, leaving a sum of 60,000*l.* sterling to complete the statuary groups and artistic works named—say, in total lire, 9,000,000.

"In conclusion, I may briefly explain the *motif* or reasons for giving my design the form adopted. Firstly, I consider that a memorial of this nature should be adapted mainly for and to its own special purpose, else it is not worthy of erection at all. The popular notion of coupling some other object therewith, such as a hospital, college, charitable or religious establishment, or other utilitarian scheme, is a vulgar and an ignoble one. For a great and national work the object commemorated is worthy in *itself* the cost and sacrifice involved in its creation. But if, as no doubt it is desirable, that a large structure like this should serve *some* practical purpose, I would point out that no more noble or useful purpose could be associated therewith than a public bridge, and on a place hallowed by one of the most heroic achievements of Latin history, the defence of the old Sublician bridge by HORATIUS COCLES.

"Further, I have conceived the idea that the reunion of the severed banks of the Tiber, as shown in this bridge, is a project worthy of associating with the union of the great Latin people and the consolidation of its empire and future greatness, as inaugurated and perfected by the late King VICTOR EMMANUEL II."

The *Pons Sublicius* was the oldest and most interesting of the Roman bridges. Nothing is left of it at present except some of the foundations of the piers, visible at low water. Originally of wood, or *piles*, from which it takes its name, it was noted as being the bridge defended by HORATIUS COCLES, who in person withstood the entire army of PORSENA till the retreating Romans succeeded in breaking it down behind him. It was subsequently rebuilt at three different times as a stone bridge, and finally destroyed by an inundation in 780, but some of the broken arches and the piers existed till the middle of the fifteenth century.

NEW PREMISES, NO. 398 MILE END ROAD, E.

THIS building is in course of erection for Mr. L. OSOSKI, and is intended for use as a wholesale clothier's. The works are being executed by Mr. J. PARFITT, from the design and under the superintendence of Mr. W. SECKHAM WITHERINGTON, F.R.I.B.A., 79 Mark Lane, E.C.

## SHOOTING-BOX.

THE accompanying illustration shows a design for a small lodge, or shelter, for the convenience of shooting-parties, and a convenient resting-place for ladies, also to save the trouble of carrying about much of the impedimenta incidental to shooting-parties. The estimated total cost is 430*l.* Mr. SAMUEL J. NEWMAN, A.R.I.B.A., is the architect.

BATLEY COTTAGE HOSPITAL.

LAST week an illustration was given of the new Cottage Hospital in Batley. For many years the work of the hospital has been carried on in an old four-roomed house at Purlwell, which was rented for that purpose, but it was found far too small and inconvenient for the requirements. The committee therefore resolved to provide a substitute. A site was obtained in 1880 from Lord WILTON. It is conveniently situated outside the busy part of the town, in Carlinghow Hill, leading to Upper Batley, where there are many suburban residences.

In December of the same year contracts for the whole of the works were let, amounting to 3,850*l.*, several liberal subscriptions having been promised. Mr. WALTER HANSTOCK, A.R.I.B.A., was appointed architect, his services being rendered gratuitously in order to give aid to the project.

The works are now finally completed, and the total cost of the building, fence walling, entrances, gardens (forming and planting), extra walling on account of enlargement of the ground, new iron railing, road on low side premises, marbles, stoves, cooking-ranges, gas-fittings, &c., amount to 4,512*l.* Beyond this the furnishing of the establishment has cost 350*l.*, making the total outlay for building and furnishing complete 4,862*l.*

The sum of 3,600*l.* has been received in subscriptions. In 1882 the ladies of Batley held a bazaar on an extensive scale, which was acknowledged on every side to be a splendid success. From the proceeds of this bazaar the ladies handed over to the committee the large sum of 2,615*l.* 19*s.* 5*d.* net, then making the total amount of cash in hand from all sources 6,215*l.* 19*s.* 5*d.*, and leaving about 1,300*l.* to start the endowment fund. This fact, in the face of depression of trade and bad times, speaks remarkably well of Batley with its 30,000 population.

The aim of the promoters has been to make the Batley Cottage Hospital one of the best models in England, and many good examples were examined before it was designed.

The building was opened by the Earl of WILTON on March 27, 1883.

## EXHIBITION OF TURNERY.

THE Turners' Company will hold their annual competition in the art of hand-turning in wood, ivory, and metal at the Mansion House in October next. The prizes will include the freedom of the company and various medals and certificates of merit given by the guild, and money prizes offered by the Baroness and Mr. Burdett-Coutts, the Master (Mr. C. W. Turner), Mr. A. P. Bower, Mr. F. Young, and Mrs. Begley. Special prizes will be given to apprentices. In the wood and ivory classes, the qualities essential to success are beauty of design, symmetry of shape, utility and general excellence, exact copying, fitness of the work for the object proposed, and novelty. In the metal classes, the essentials are truth in turning, accuracy in fitting and finish, exactness in copying, due proportion for stability and strength, and elegance in form. The judges will be, in wood and ivory, Sir F. Leighton, P.R.A., Mr. Bower, Mr. Brindley, Mr. Burdett-Coutts, Mr. Holtzappel, and Mr. Josolyne; and in metal, Sir H. Bessemer, Sir C. Hutton Gregory, Sir William Siemens, Mr. C. Douglas Fox, and Mr. John Jones. The Lord Mayor will distribute the prizes on October 26. Dr. R. T. Pigott, of 36 Southampton Street, is the hon. secretary of the Competition Committee.

The Duke of Westminster has given a piece of ground as a site on which a new vicarage for St. Mark's Church, North Audley Street, Grosvenor Square, may be built. The value of this gift is estimated at about 3,000*l.*

## ROYAL ACADEMY.

THE following students have been admitted to the Architectural School of the Royal Academy:—

*Upper School.*—F. W. Besant, G. E. T. Lawrence, T. Maclaren, G. F. Oakeshott, T. Ward.

*Lower School.*—C. H. Aitken, W. Brown, S. R. Clemence, E. L. Condor, A. Crow, G. G. Dawber, R. M. Fell, Frank Fox, C. Littlewood, E. Herbert, C. S. Hornabrook, W. C. Jones, F. W. Lane, Henry Ling, C. E. Malloes, J. C. S. Mummery, A. B. Pite, S. H. S. Seager, W. E. Symington, W. A. Thompson, J. M. Townsend, W. R. Tucker, H. J. Westell, C. F. E. Yonge.

*Probationers.*—Louis Ambler, C. S. Appleton, W. H. Bidlake, Frank Brown, C. A. Coxhead, H. W. Crickmay, W. J. W. Ferguson, T. P. Figgis, H. R. Goodrham, F. C. Hart, John Lord, F. S. Ogilvie, E. C. Pickford, T. B. Rutherford, H. D. Walton, R. W. Williams, G. G. Woodward.

## PROPOSED ART SCHOOL FOR BLACKBURN.

A MEETING was held in the committee-room of the Town Hall, Blackburn, on Monday, to promote the establishment of a local school of art. In the absence of the Mayor, Mr. James Hoyle, the chair was taken by Mr. Wm. A. Abram. A resolution to the effect that it was desirable to establish a school of art for the borough, in connection with South Kensington, was proposed by Mr. F. C. J. Stock, who observed that the movement which had called them together was not new, and had not arisen from a sudden impulse, but was the result of a feeling that had existed for years and only wanted a favourable moment to be called into activity. A generation ago art was only a conventional thing. That was seen in the exhibition of works of art that took place occasionally, and in the character of domestic decoration, in the flaming and wonderful designs for wall-papers, carpets, pottery, and glass, and in the silks for ladies' dresses. In all times and all countries when wealth had been accumulated the people craved for the enjoyment of that wealth in a rational and befitting manner, as was seen in the case of the Greeks and Romans, the chief nations of the continent of Europe, and, finally, up to a certain point, of China and Japan, from which countries there now came models of the best taste. The renewal and improvement of taste in the country was due to the establishment of art schools, which had all been more or less successful. The schools of art naturally led to the feeling that they should be combined with technical schools, and there they trod on familiar ground. As men of business they ought to see that their workpeople were not handicapped in the race, but were placed in a position to win the race if possible. Art in its modern application was practically the twin sister of industry. There was no reason why a school of art should not be established in Blackburn. They only wanted to start in a modest way, and let the future of the school be guided by the measure of success attained. Mr. Luke S. Walmsley seconded the resolution.

An address followed by the Head-Master of the Manchester School of Art, Mr. Willis, who, as illustrations of the general statements made by the previous speakers, mentioned the case of a country lad who had attended a school of art and was made foreman by a large builder when he had completed his apprenticeship, and who, after obtaining a similar position with a London firm, commenced business on his own account; of a carpenter who had become a flourishing builder; and of a young house painter who was now a gifted designer in the employ of a leading firm of furniture designers and makers in London. The last-named, after attending a school of art in Limerick, secured one of the national scholarships given to those who excelled in design, tenable for two or three years, and amounting to sums varying from 1*l.* to 2*l.* per week. The intention of the department in offering the scholarships was to induce the most gifted students to go to London for instruction, and there receive all the advantages which the resources of wealth could give, and then to return to be the exemplars of the kind of work that should be done. That had been done to a large extent, particularly in towns where there was a great demand for artistic productions. From the school at South Kensington there had been sent out teachers to centres of civilisation all over the kingdom, and now there were in different parts of the country schools that any man might be proud to attend. The movement was still growing, and if Blackburn, which was now very much behind, did not make a move it would be still further left behind. He hoped, however, that there was sufficient energy, money, and public spirit in the town to make a good start now that the matter had been mooted. He found a very decent little art school at Accrington, and the people of Preston were fully alive to the immense advantages that education conferred. In days gone by education was not much thought of, but now the race was to the educated, whether as working men, professional men, or business men. They had sent some of their members as pioneers throughout the country to glean all the information possible as to the most recent methods of doing everything, and now they were applying that information. They were to have a technical school connected with the art school; there were also science classes, and all the higher

education of the town was to be centred in the Harris Institute; and they were determined to have the best teaching they could get. In other towns, certainly very different from Preston, similar work was being done. Nottingham some years ago was overwhelmed with French designers, and he supposed that at that time the people thought the English mind was incapable of designing anything. But, before Mr. Roe, of the school of art, left it, he had the satisfaction of seeing the last French designer leave the town, and French firms buying designs from English designers. Such a change had taken place that French fashions were designed by Englishmen. Everywhere Continentals, if they wanted a fashionable coat, sent to England to have it, and the Paris fashions were designed by a Lincoln man. In Birmingham close upon 40,000*l.* was being spent upon a school of art and art gallery. The Manchester people had spent 20,000*l.* upon their school of art, and no doubt, if necessary, would spend a further 20,000*l.* Liverpool was just spending an enormous sum on a grand school of art, and there were also Bolton and Preston with art schools. When coming to the meeting he began to make a list of schools in towns with under 7,000 inhabitants, but he found the list would be so long that he gave up the task. Those facts showed the lack of art culture in Blackburn, and he hoped the reproach would be taken away from the town. An unique opportunity was offered in Blackburn at present. A new and magnificent grammar school was being built, and a high school for girls established, and the proposal for the foundation of an art school came in the nick of time, for he thought they ought to centralise their system of art teaching. They were unencumbered by any old traditions, had no old interests to hamper them, had no old systems to knock on the head, and had not to wait until some one died to institute a new and better state of things. He recommended them to start art classes at once, because the students received now would be quite incapable of taking advantage of a higher institution; but by the time that higher institution was obtained—and if they did the work properly, as he trusted they would, it would take some time—the students would have gone so far that it would come in for them, and there would be a circle of students to fill the new institution. He advised them to collect information, obtaining it not only from the most reliable sources in England, but elsewhere, and do as the people of Huddersfield and Bradford had done—establish a grand institution both for art in its higher forms and for technical education, or the practical application of art to local industries. In France technical education was being carried to a very high pitch, and in some places their technical schools were in advance of their requirements, as, for instance, at Lille, where there was a very large technical school, and no one to occupy it. At Birmingham it was proposed to obtain powers to erect a school of art and transfer the present school to the Corporation, and powers for the management of the new school and to defray the cost from a rate under the Free Libraries Act, the limit of 1*l.* in the pound imposed being removed in order to accomplish that object. That was done in France, where a school of art was a municipal institution, and had very large sums of money bestowed upon it. While the English commissioners reported in 1851 that English products were in danger of being driven from the market, the French commissioners at the last International Exhibition reported that the English had made such vast strides in design that French goods were in danger of being beaten out of the market. That fact ought to convince them that there was some good in art education.

Mr. W. H. Brewer, M.A., H.M.I.S., also supported the formation of an art school, and trusted that it would eventually lead to the establishment of a "Technical School." An offer was made on behalf of a local gentleman to give 20*l.* per annum for five years in support of the movement. That Blackburn, until now, should occupy but a secondary position in regard to art education, in comparison with towns of less industrial and commercial importance, was much regretted, and the subject was so warmly taken up by all the gentlemen present that there is no doubt the establishment of a local school of art will be an accomplished fact in a short time. A local committee was formed, including the mayor, Mr. James Hoyle, Mr. Joseph Brierley, C.E., the Town Clerk of Blackburn, Mr. W. E. L. Gaine, Mr. A. W. R. Simpson, architect; and Mr. Wm. S. Varley, architect; the hon. secretary (pro. tem.) being Mr. Wm. Ditchfield, Clerk to the School Board.

## METROPOLITAN OUTER CIRCLE RAILWAY.

THE Metropolitan Outer Circle Railway Bill, which has already been sanctioned by the House of Commons, has passed unopposed through the House of Lords. By this Bill powers are given to that company to deviate from their authorised line of last session by constructing a railway commencing in the parish of East Ham and terminating in the parish of West Ham, so as to form a junction with the authorised line of the Regent's Canal, City, and Docks Railway Company. The Bill also sanctions the abandonment of so much of their authorised lines as will be rendered unnecessary by the above deviation, and further enables them to raise 66,000*l.* capital in addition to the 2,000,000*l.* sanctioned last year.

THE BIRMINGHAM FREE LIBRARY.

AT the meeting of the Birmingham Town Council, on Tuesday, a report was submitted by the Free Library committee, with a statement of the accounts for the rebuilding of the Central Reference and Lending Libraries, giving the exact financial position of the Free Libraries Department on December 31 last, as follows:—

COST OF RESTORATION OF CENTRAL LIBRARIES.

Buildings . . . . .	£36,391 19 0
Fittings . . . . .	13,383 2 2
Decoration . . . . .	800 0 0
Miscellaneous Expenses, viz.:—	
Insurance . . . . .	£35 2 3
Miscellaneous work done before fire . . . . .	144 1 6
„ in connection with fire . . . . .	193 2 1
„ in old building consequent upon fire, and preparing for re-building . . . . .	255 15 6
„ in connection with Art Gallery . . . . .	218 15 5
„ opening ceremony . . . . .	84 14 10
	931 11 7
Clerk of Works . . . . .	400 9 0
Architects' commission . . . . .	3,068 13 0
	3,469 2 0
	£54,975 14 9

It is explained that the difference between 2,575*l.* (the usual commission of 5 per cent. on 51,506*l.*) and 3,068*l.* 13*s.* is due to the fact that previous to the fire the architects had prepared many sets of plans for the alteration and extension of the former reference library which were not carried out, and for which they were allowed 493*l.* 13*s.*, which, added to the 5 per cent, makes up the 3,068*l.* 13*s.*

As compared with the estimates approved by the council, the account will stand thus:—

	Actual Expenditure.	Excess.
Amount actually expended on buildings . . . . .	£36,391 19 0	
Amount authorised by the Council, by minute 11,615 (May 20, 1879) . . . . .	32,000 0 0	
	£4,391 19 0	
Amount actually expended in fittings . . . . .	13,383 2 2	
Amounts authorised by the Council, by minute 12,860 (February 7, 1882), viz.:—		
Messrs. Barnsley for shelves . . . . .	£7,698 0 0	
Messrs. Haden & Son, heating . . . . .	1,140 0 0	
Messrs. Strobe . . . . .	1,711 4 0	
	10,549 4 0	
	2,833 18 2	
Add decoration . . . . .	800 0 0	
Total excess of expenditure in buildings and fittings . . . . .	£8,025 17 2	

SANITARY PRECAUTIONS FOR LONDON.

AT a meeting of the City Commissioners of Sewers, on Monday, Dr. Sedgwick Saunders, the medical officer of health, reported that much alarm having been created by premature speculations on the probability of cholera reaching this country during the autumn, and as the Government had issued orders and regulations on the subject, and as the general working of the sanitary department of the City had been criticised in various directions, it seemed desirable to see how far censure was deserved. Their system of organisation was not perfect, many of its defects being remediable, while others were beyond their control. The medical officer of health had to bear all the obloquy attaching to nuisances arising from foul sewers, mephitic exhalations from ventilating shafts, badly-placed gullies, and overlaid catchpits, though he was powerless to prevent them. The restrictions placed on sanitary authorities by legislative enactments, the leniency of the magistrates in deciding complaints by sanitary officers, and the clashing of various departments, seriously embarrassed the action of the medical officer, and the efficient discharge of his duties in the face of any epidemic of magnitude. The primary function of a sanitary authority was the prevention of disease, and that, in the class of ailments connected with zymotic action, could be largely secured by rigid cleanliness, pure air and water, and perfect ventilation. In order to minimise the danger of such a visitation as cholera they should at once endeavour to eliminate from them those elements which acted as factors in its production, and regulated and governed its virulence. The sewers should be flushed oftener than at present, and deodorants used occasionally. Foul gases from the sewers should be intercepted by providing a filtering medium of freshly prepared charcoal at the junction of

the ventilating shaft with the roadway, and by closing the gratings in the roadways altogether, and carrying a pipe, having a *minimum* diameter of 6 inches, from the top of the ventilating shaft to the roof of an adjoining house. The catchpits in connection with the street gullies should be emptied and deodorised every 24 hours. The roadways should be sprinkled daily with water containing some germicide. The courts and alleys should be flushed and deodorised daily, and the entrances and side walls of the narrower courts lime-whitened occasionally. All house refuse should be removed daily, and the public dustbins emptied twice a day. The regulations for the removal of hog-wash and all kinds of animal and vegetable refuse from taverns and restaurants should be stringently enforced. Stables and cowsheds should be frequently inspected, and persons conveying offensive material through the City during prohibited hours should be prosecuted. Special examinations should be made into the condition, location, and water supply of cisterns in houses and public buildings. The superintendent of scavenging should be placed in direct communication with the medical officer of health, and be subject to his orders. The common lodging-houses should be put under more direct control, and each one properly registered. Prosecutions should be systematically instituted against offenders under the Smoke Nuisance Act. The food inspectors should be enjoined to increased vigilance in detecting and seizing every description of unsound food, including meat, fish, fruit, and vegetables. On the appearance of the first well-authenticated case of cholera of the true Asiatic type, a house-to-house visitation by competent medical men should be at once commenced. He would advert to the paramount importance of close attention to the condition of the water supply. The general consensus was that water was the great carrier of all poisons which emanated from the *dejecta* of enteric diseases. The water should be analysed from time to time, and the position and cleanliness of the cisterns carefully considered. The report was ordered to be printed and circulated, and referred to the Sanitary Committee.

THE THAMES COMMUNICATIONS.

AN important report by the Works and General Purposes Committee was adopted at the meeting of the Metropolitan Board of Works on Friday, last week. The Committee stated that they have had under consideration the several references from time to time made to them by the Board with regard to suggested means of communication between the north and south sides of the River Thames east of London Bridge, and also with reference to two extensive street improvements which have been brought under the notice of the Board, namely—the widening of Parliament Street, and the improvement of the approaches to the Law Courts. The question of providing efficient means of communication between the two sides of the river below London Bridge had long occupied a prominent position, and was admitted to be one of pressing importance. Various proposals have from time to time been made for dealing with the matter, and numerous memorials have been received from local bodies and others on both sides of the river urging the desirability of steps being taken to provide the means of communication required. As regards the proposed widening of Parliament Street, a communication was in the latter part of last year received from the First Commissioner of Her Majesty's Works, &c., intimating that the Government, having decided to erect the new public offices on the site between Parliament Street and Spring Gardens, it became his duty to dispose of certain properties in Parliament Street, Great George Street, King Street, and Charles Street, which were acquired in the expectation that the site might be needed for the public offices, and that, under these circumstances, he desired to afford the Board the opportunity of purchasing the property in question, with a view to completing the approaches to Westminster Bridge and the Houses of Parliament, by widening Parliament Street to the same extent as Whitehall. The remaining proposal referred to in the report is the providing of a new line of communication between Holborn and the Strand, and the improvement of the latter thoroughfare in the neighbourhood of the Law Courts. This is a matter which has been before the Board for a considerable period, and as to the urgency of which many representations have been made. The committee have very fully discussed the subject of the foregoing proposals, and as to the desirability of steps being taken by the Board towards carrying them into effect, the conclusion arrived at being that it is, in the interests of the public, desirable that the Board should endeavour to carry out all the undertakings. With reference to the question of cost, whatever might be the particular plans ultimately decided on, a very considerable expenditure must be involved, and the committee have accordingly considered the financial aspect of the question. The Board have already made representations to the Government as to the expediency of continuing the coal and wine duties, which are now leviable only till the year 1889; and if the Board is to undertake the extensive and costly works of utility and improvement referred to in this report, it will be more than ever necessary that the time within which these duties may be levied should be prolonged. The resolution submitted by the committee recommended that the Board should obtain

power in the next session of Parliament to construct communications across the Thames east of London Bridge, to widen Parliament Street, and to improve the approaches to the Law Courts; and that, for the purpose of carrying out the same, Parliament should be asked to sanction the extension of the coal and wine duties.

### THE NATIONAL PRINTS AND DRAWINGS.

IN announcing the retirement of Mr. Reid from the office of Keeper of the Prints and Drawings, the *Times* called attention to the favourable opportunity afforded for facilitating the study of art by uniting the department of which he had been the director with the National Gallery. The recognition of the desirability of this step, so long demanded, has received general acceptance, and there is every reason to expect that the subject will be treated in such a manner as to satisfy both the public and the professional students. It is unnecessary to repeat the reasons for the amalgamation; they have been so often stated as to be familiar to all interested in the matter. A word, however, may be said to allay the fears of those who, knowing the National Gallery to be already pinched for room, think that under the new arrangement the pictures will be still more crowded. Pictures require what is called a top-light—that is, that the galleries should be lighted by sky-lights. Drawings and engravings are, perhaps, best seen by a side-light, as when the light is admitted by windows. Thus at the National Gallery the rooms are on the first floor, leaving a floor below unoccupied, saving by offices, and even at present the space is more than sufficient for this purpose. When the additional galleries are completed for the pictures there will necessarily be so much additional ground-floor admirably adapted for the new department. And it must further be remembered that after the expression of opinion, both in and out of Parliament, the whole of the ground now occupied by the barracks and Government stores must ere long be given to the National Gallery. The futility of the reasons for retaining the barracks in their present position has long been exposed. That they should prevent the natural expansion of an institution of such importance as the National Gallery is an absurdity, to say nothing of the danger to a priceless collection of works of art from causes to which barracks are certainly liable.

It is only to be expected that in making the change the authorities will study the procedure of foreign galleries in this matter, especially in those countries where a scientific method of arrangement has been adopted. At Paris the drawings are united with the pictures in the Louvre, the prints being in the national library at the Rue Richelieu. At Berlin prints and drawings are under one department, as with us, but are in the same building as the Old Masters. At Florence and Venice it has been accepted that the drawings cannot be divorced from the pictures; still, it cannot yet be said that the galleries of Italy in other respects are arranged on such a basis as to afford many suggestions that would be valuable to ourselves. The French system undoubtedly offers advantages in respect that it necessitates two directors, one for drawings and another for prints; and, considering the requirements of modern culture, and the vast additional amount of study necessary for mastering one subject, it can only be by a rare chance that a man can be found thoroughly versed in the knowledge of prints and drawings, or sufficiently so that his judgment can be thoroughly relied on for the acquisition of examples of both classes. It does not, however, follow as a matter of course that because the French have recognised the advantage of dividing the directorate that their division of the department is judicious. Herein it seems Berlin has made a step in advance in bringing the prints to their National Gallery. Because, though in the study of pictures the drawings give more important aid, still the engravings are also essential in many directions. The same may be said for the value of the pictures in regard to the due appreciation and understanding of engravings. There is one branch of the department of drawings which is likely to assume importance in the future, and which already has received considerable attention from Mr. Reid—that is, the reproductions by photography of foreign collections of Old Master drawings. Their arrangement and classification will add to the duties of the director, as the room required for their exhibition will make further calls on the space at his disposal. In connection with these facsimiles, it is matter of surprise that their value has not been more fully appreciated by those interested in our provincial museums. Instead of wasting their efforts in seeking to form their museums from the national collections in the metropolis, which would be simply rendering the latter useless for the study of art, they should set about making as perfect collections as possible of casts and photographs from the finest examples of ancient art. Whatever countenance the scheme alluded to may receive from politicians, we may rest assured it would have the most uncompromising opposition of all who make art the business of their lives, simply because, while the metropolitan museums would be wrecked, the provincial museums would be equally valueless, and all students would have to migrate to other countries, where a more rational system might still prevail. Supposing, however, what is more

likely to happen, that the organisers of provincial museums see the direction wherein lies their true interests, they will naturally look to the collection of photographs from drawings at the National Gallery as a model for imitation, and will as naturally apply for advice to its head.

The general expressions of regret at Mr. Reid's resignation have been accompanied by the acknowledgment that he possessed the rare faculty of a curator and to a very high degree. It would seem desirable that the country should endeavour still to benefit from Mr. Reid's exceptional knowledge, and at the same time it might pay a well-deserved compliment to a public servant by placing him in a position to assist in the organisation of a department he has so long superintended. The trustees of the National Gallery are supposed to be distinguished connoisseurs, and, however deep their interest in art, it is no discourtesy to say that none would claim the special knowledge of men who had concentrated their faculties on the subject. Indeed, the deeper their interest in the advancement of art in England and the prosperity of the institution with which they are connected, the more earnest would be their desire to secure the co-operation of specialists like Mr. Reid.

### SMOKE ABATEMENT.

THE annual meeting of the National Smoke Abatement Institution was held on Monday in the Egyptian Hall, Mansion House. The Lord Mayor presided. Among those present were the Duke and Duchess of Westminster, the Duke of Northumberland, Sir Lyon Playfair, Captain Douglas Galton, Sir W. Siemens, Sir Fred. Abel, Sir Spencer Wells, Sir F. Pollock, Mr. Ernest Hart (chairman of the Council), Colonel Makins, M.P., Colonel Fraser, C.B., Major-General R. W. Lowry, and others. Letters of apology were read from Lord Derby, the Archbishop of Canterbury, and others.

The Lord Mayor in opening the proceedings referred to the work of the society, and said that living as he had done in the heart of the City of London for seven or eight months of the year, he found, the houses being mostly used for business purposes, that the atmosphere of the City was much clearer than it was in former years, when the buildings were more used as dwelling-places than now. On a Sunday afternoon, when the City was quiet and not disturbed by traffic, and when the houses were comparatively empty, they could see a sky as beautiful as any Italian sky.

Mr. Ernest Hart read the report of the Council, which set forth that since the last public meeting they had carried into effect the resolution to establish and organise an association to continue in a more formal way the work the committee had hitherto carried on. Having examined the present state of the administration of the law for the suppression of smoke, the Council had made various communications to the Home Secretary upon the subject. In a recent communication addressed to the Home Office, it was pointed out that the analysis of the return of convictions for offences against the Smoke Acts in the metropolis, extending over a period of five years, proved that most of the fines inflicted for "first offences" were below the legal minimum of 40s., and actually amounted on an average to only 7s. 11d., while in subsequent convictions the fines were below the legal minimum of 80s., and averaged actually only 10s. 1d. The Council further pointed out that the treatment of the cases was very unequal, and that the present administration does not comply with the letter—far less the spirit—of the legislation. The returns showed the most extreme variation in the treatment of cases in the different courts. From careful investigations the Council had made, it was proved that a large number of works were actually carried on in London and elsewhere without causing a nuisance, and that smoke could be to a great extent, if not entirely, prevented. The Council considered that in view of the enormous extension of buildings and factories in London and the large towns in the kingdom, and in view also of the evidence that smoke could be, to a great extent, if not entirely, avoided, the scope of legislative enactments for abating smoke should be extended, and their provisions duly enforced.

The Duke of Westminster, in moving the adoption of the report, said the only *locus standi* he should have at a meeting of that sort was that he was the proprietor and representative of many thousands of those rank offenders in the shape of smoke-discharging chimneys. The smoke nuisance was not only a gigantic evil; but considering that the population of the metropolis increased by 40,000 annually, it was naturally an increasing evil. He believed it was an evil which might be very much modified; indeed, be believed entirely prevented. They had it on indisputable authority that the smoke which was unburnt annually was waste of a gigantic character. They had it on various authorities that the waste from this source annually was 1,000,000*l.* in London alone, and that with the damage done to buildings the sum lost each year was no less than 2,000,000*l.* The waste in the country generally might be calculated to be proportionate. Mr. Shaw-Lefevre stated that the damage caused by smoke to the Houses of

Parliament alone amounted to 2,500*l*. Besides this damage to property, there was the injury to health from having to dwell under a dense canopy of smoke, and one of the objects of a meeting like that was to endeavour to make the public realise, not only how the evil arose, but how it might be remedied by the application of inventions, by the diffusion of information, and by the awarding of prizes for improved appliances, until a way of escape was found from the great curse of smoke.

Sir Spencer T. Wells seconded the motion.

Sir F. Abel pointed out that though the burning of solid fuel might be rendered smokeless, yet large quantities of sulphur would escape into the air. The way to conquer that difficulty was by the use of gaseous fuel, which by a simple process could not only be made to serve the purpose of heating, but to produce a light which might even vie with the electric light in brilliancy.

The resolution was passed.

The Duke of Northumberland moved, "That the period has now arrived at which systematic inquiry is desirable into the application of the resources of technical science for the abatement of smoke now largely produced in industrial processes and in the heating of houses, as well as into the operation of the existing laws for smoke abatement; and that the Council of the National Smoke Abatement Institution be requested to urge upon the Government the desirableness of appointing a Royal Commission for the purpose." While he advocated the proposals contained in the resolution, he found it difficult to suggest any course without the aid to be derived from favourable public opinion. Still, he considered the way in which fines were at present imposed rendered them inefficacious for their purpose, and he attributed the fact of fines being below the minimum laid down in the Act to the circumstance that magistrates were ready to accept the assurance of transgressors that the smoke nuisance charged against them would be remedied. Discretion properly used could not be complained of; if not properly used, then it was important that the law should be so amended as to render indulgence impossible.

Sir W. Siemens seconded the proposition, and the resolution was passed.

Votes of thanks to the Lord Mayor and to the Duke of Westminster, who had presided during the latter part of the meeting, brought the meeting to a close.

## EXPLORATIONS IN GREECE.

MR. W. G. STILLMAN, who has been American consul in Athens, in a letter dated from Cutigliano, referring to the proposed British school at Athens, writes as follows:—

Ancient Athens is the one luminous point from which we borrow light, more or less, for all that world of art and letters which lies still buried in the obscurity of the unhistorical past. From there we must take most of our measurements.

And of the work to be done there, and in which the British school may bear its honourable share, it is to the admirable French school that we must look for the example rather than to the more dazzling achievements at Olympia and Gutbakche. Few people away from Athens are aware of the mass of material, epigraphic and technical, which the French school has collected. But neither would this success have been attained had the investigations been limited to Greek territory, nor would any Government have gone to the continued expense the school causes from purely platonic devotion to archæology. The results accruing to the Louvre have been, I conceive, indispensable to the continuance of the school, and for these results the school is obliged to go to Turkish territory, with the consequence that we gather more knowledge of secondary points of Greek archæology from their labours than of the points of chief interest. Excavation is an indispensable part of the study of archæology, as anatomy of medicine. It is superfluous to say that it is equally so to the discovery of new material. But it is expensive and very uncertain in its returns, and likely to task more severely the liberality of Englishmen (in default of Government appropriations) than the ordinary expenses of the school. Such liberality is not likely to be excited under the present illiberal system of the Greek Government. While it is unquestionably true, as you say, that "the spirit of the time sets itself sternly against the sort of archæological pillage which found favour with former generations," it is to my mind (and I have some experience in the study of these matters) equally true that private contributions for archæological research are not likely to be largely forthcoming without quicker stimulus than the discovery of remote facts and the increase of Greek museums. There are probably many wealthy men who would give the means for specific undertakings, with the prospect that a part of the proceeds should, in gratification of a natural and worthy patriotic or personal pride, go to the British or local English museums as their contributions, but who would regard with a very platonic indifference projects whose only tangible result was to accumulate antiquities for the sheds of Olympia and Mykonos, or even for the Museum of Athens. My own experience encourages me to hope for very little private aid to research in Greece without a relaxation of the present laws and

regulations of the Hellenic Government. I venture to predict that without this the British school will, as the French does, find its chief field of study in Turkish territory. No one wants to rob Greece, and most students of archæology would be glad to see that system adopted which most encouraged discovery, no matter who profited materially. This is not the Greek way of looking at the matter, and the result is that, beyond their own very restricted means of excavation, little relatively is done openly and by scientific associations, and much is done (to the great loss of archæology) by secret and destructive digging by speculative operators. If the Greek Government and nation had, or were likely in the course of generations to have the means to do all, of even the most important, work to be done, nothing could be said of their exclusiveness; but as the case now stands, even with all their illiberality, the most important work is done (thanklessly at that) by foreigners, with results which very much diminish the prospects of future labours.

I believe that most students of archæology in Greece will agree with me that the chief impediment to the progress of discovery is in the jealousy and narrowness of spirit of the Greeks, and that if the Government were to adopt not the liberal Italian law, but even the Turkish, and reserve to itself the right to retain as its share of all proceeds of excavation the most important objects, and then abolish the control of that most narrow and jealous of all scientific bodies, the Archæological Society of Athens, throwing open the fields of research to all scientific organisations under proper restrictions, not only would the Greek museums profit enormously, but archæology would benefit to a still greater degree, and we should be able to rejoice over the preservation from destruction, not merely by time, but by ignorance and barbarism and the consequences of clandestine commerce, of numerous—nay, innumerable—data of the highest importance to archæology.

The Greek Government has now at its head a statesman of high practical intelligence, of unhesitating patriotism, and unflinching honesty, and who, if heartily supported, can carry any reasonable reforms. I know from personal communication that M. Tricoupi is in favour of a change of the archæological laws, but public opinion in Greece must be acted on to enable him to do anything. The Greeks are in general excessively shortsighted in their political views, but too intelligent not to see their best interests when clearly pointed out. If the establishment of a British school at Athens were the occasion of a friendly exposition of the relations of the Greeks to the researches into their own archæology, it might be an incalculable assistance to the school itself.

Although the number of valuable works of art found in Italy, and to be probably found, is incalculably greater than in Greece, the Italian Government puts no restriction on their exportation beyond the prior right to purchase those which it regards important for the Italian museums. There is thus every inducement to excavation, and none to that clandestine trade and mutilation by both of which Greek archæology suffers beyond estimate. In my own personal experience I have known some of the most valuable acquisitions to certain branches of archæology to have utterly disappeared, lost to the science, owing to the restrictive measures of the Government, measures which equally thwart and hamper all practical studies of the schools already in existence to a degree which people in England do not comprehend and probably would not accept. What a French school with official support can with difficulty tolerate would drive a British school under personal encouragements out of the field. The essential condition for the prosperity of a school of archæology in Greece does not exist, and by fault of the Greeks.

## POINTING OF RUBBLE WALLS.

A LETTER from Mr. J. H. Parker, C.B., has been addressed to the secretary of the Institute of Architects, in which he writes:—

Many of the architects of the Victorian Gothic style have adopted the plan of pointing the joints of rubble walls. This appears to me a great mistake and a foolish waste of money. Such walls were never intended to be pointed, and never were pointed in the time of the Mediæval Gothic architects of the Henrys and the Edwards. They were occasionally left visible, but rarely, and then only because there was not money enough at the moment to have them plastered and painted. Painting the interior of a church was always part of the original design, and the architect gave the design for the painting of the interior just as he did the design for the mouldings or other ornamental details. On the exterior these rubble walls were also plastered, but the surface was covered with rough-cast to keep out the wet. Many kinds of stone absorb so much moisture, if they are exposed to the wet, that the walls are nearly always damp, and this makes the interior of the church damp also. Pointing the joints between the rough stones of a rubble wall does not keep out the wet; it does no good either on the outside or inside. In the interior it almost prevents the wall being plastered over and a smooth surface made for painting upon, and the next generation will curse the ignorant people who have thus prevented them from having their churches painted.

My experience may lead those architects who adopt this vile practice to discontinue it. I am aware that my good friend the late Sir Gilbert Scott is said to have set the example of doing this; but I am sure that he never intended to do so, nor did it in the way ignorant imitators do. It was always his practice in restoring cathedrals or any fine old church to leave visible some parts of the old construction, in order to show what the real features of the building were before he began to restore it. In each of the nineteen cathedrals that were under his care as superintending architect at the time of his death, those who can understand such things can always find some portions of the original work left visible, but not conspicuous. His imitations were generally so well done that if he had not taken this precaution the next generation would not have been able to distinguish the new work from the old; but he always considered it the duty of the architect employed to restore a fine old church to make it a real restoration as far as possible, and not a new design with an old name. For this reason he always left visible a part of the old work, but not too conspicuous, lest it should have a bad appearance, for the general effect of the interior of the building is never to be lost sight of.

## REVIEWS.

**THE METROPOLITAN BUILDING ACTS, 1855 to 1882.** With Appendices. By W. CUNNINGHAM GLEN and J. R. CUNNINGHAM GLEN. Published by Shaw & Sons.

There seems to be a competition in publishing editions of the Metropolitan Building Acts, and under the circumstances of the case it is difficult to keep the editions from being alike in character, and no less difficult to decide which is entitled to precedence. What strikes us as characterising the edition by Messrs. Glen are the extent of the notes, which include recent cases, the circulars of the superintending architect of the Metropolitan Board, the copies of Acts which relate to the City, and the comprehensive index. The book is well printed, with margins that allow of notes.

**ESTIMATING A METHOD OF PRICING BUILDERS' QUANTITIES FOR COMPETITIVE WORK.** By a Practical Estimator. Published by B. T. Batsford.

The determination of prices in a builder's office is one of the "open secrets." They are supposed to be known only inside the office, and are jealously guarded; but somehow a shrewd guess as to what they are can be given by outsiders. The compiler of this book on estimating evidently being a man who has had experience, and knowing, we suppose, how important is this secrecy, does not give his name, but he enables everyone who has a few shillings to enter, as it were, into a builder's office and see how schedules are made out. "The bills of quantities I use," he says, "were supplied by a well-known London surveyor to estimate from, and the work was a villa residence at Hampstead; the estimate framed on the prices given was barely 2½ per cent. above the lowest." This extract indicates the character of the book. It is elementary, as the subject is only a London villa; but work of this class is better adapted for beginners. The "Practical Estimator" takes up the various items and explains how they are to be priced, the nature of the competition being always kept in view. The builder's profit is supposed to be 10 per cent. The novice will find a good many "wrinkles" in the book, but he will do well to test the prices before he makes them a standard, and for this purpose Mr. Batsford might find it an advantage to issue copies interleaved.

**HOSPITAL CONSTRUCTION AND MANAGEMENT.** By F. J. MOUAT, M.D., F.R.C.S., and H. SAXON SNELL, F.R.I.B.A. Part I. Published by J. & A. Churchill & Co.

The present age has its shortcomings, but much may be pardoned for the sake of the beneficent spirit which is exemplified in the attention given to the improvement of hospitals. Charity is no new invention, and in the worst times people were ready to help the sick; but hospitals of the kind which are now in almost every English town are a modern institution in England. Macaulay records the great difficulty of the Government in 1692 to provide shelter and attendance for the men who were wounded at La Hogue. There was not then, he says, in the whole realm a single infirmary supported by voluntary contributions. Even in the capital the only edifices open to the wounded were the two ancient hospitals of St. Thomas and St. Bartholomew, and seeing the need the Queen ordered the buildings at Greenwich to be completed. The York Hospital, which is one of the oldest, was not founded until 1710, Westminster dates from 1719, Cork from 1720, and Edinburgh from 1736. The example which was set up in England in the eighteenth century was imitated in most of the countries on the continent. But when those hospitals were erected, it was not believed that the planning of a building could have any influence in the recovery of the patients. The wards were simply large unventilated rooms, and there was everywhere in the buildings a primitive indifference to sanitary arrangements. Some wards were dignified with the title "convalescent;" they were generally placed in positions so as to be out of control, and in them elderly patients and children were at the mercy of the men

who most quickly gained the strength which enabled them to be brutal. It is not surprising that at least one patient in ten in the principal hospitals succumbed to bad nursing and bad air.

Philibert Delorme three centuries ago offered suggestions which, although somewhat indefinite, have been interpreted as foreshadowing a perfect hospital. It would be better, he says, for the architect to fail in his ornamentation, and in things intended for the gratification of the eye, but which bring no advantage to the life and health of man, than in the rules of nature, which tend to the convenience, use, and profit of the inhabitants. But experts have not yet agreed what those rules of nature are, and in consequence there are several systems of hospital construction. Dr. Mouat attaches much importance to the suggestions which have been offered by the Surgical Society of Paris. In laying out a site, an area of about sixty square yards should be, it is said, allowed for each patient; an hospital with from 200 to 250 sick can be made to fulfil good hygienic conditions; an increase of superficial area as well as of cubic space is required, and the building should be limited to two storeys. The buildings should be placed in a single or in parallel lines at intervals of from 80 to 100 mètres, so as to insure effective separation and external aeration. Those suggestions have been generally accepted, the chief exception being the new Hôtel Dieu in Paris and St. Thomas's Hospital. In the latter it arose, according to Dr. Mouat, "from a singular and not very intelligible misapplication of those principles." "It is difficult," he says, "to understand how those responsible for this latter structure could have considered its division into huge blocks, six storeys in height from the basement, connected by continuous closed corridors, and many of its internal arrangements equally defective, to be a correct representation of the pavilion principle."

Some of the best examples of that principle are described in the book on hospitals by Dr. Mouat and Mr. Snell, of which the first half has appeared. There is an advantage in the co-operation of an architect and a physician, for while one writer is able to describe the constructive details with accuracy, the other can suggest how far the buildings are adapted to the work of a hospital. The book will enable the reader to understand the latest development of the pavilion theory, and, what is of equal importance, the shortcomings that are found in many of the best efforts to embody that theory. For architects who have to gain experience in hospital construction the book will be a mine of information. The buildings which are described comprise English and foreign examples, viz., the Herbert Military Hospital, Blackburn Infirmary, Leeds Infirmary, St. Thomas's Hospital, Edinburgh Infirmary, Glasgow Western Infirmary, Norfolk and Norwich Hospital, Marylebone Infirmary, hospitals at Mons, Antwerp (which is surprisingly like Professor Marshall's circular hospital), Heidelberg, Berlin, Düsseldorf, Königsberg, Ehrenbreitstein, Dresden, and Strasburg. It will be seen from the list of subjects that Mr. Snell does not obtrude his own work on his readers, and in treating of the work of other architects he is never censorious or unfair. The Edinburgh and Glasgow examples receive the highest praise from Dr. Mouat.

**MEMORIALS OF CHRISTCHURCH, TWYNHAM, HANTS.** By the late MACKENZIE E. C. WALCOTT, B.D., F.S.A. Third edition, revised by B. Edmund Ferrey, F.S.A. Published by W. Tucker & Son, Christchurch.

The beautiful Augustinian church in Hampshire has found a multitude of admirers since Bournemouth became a fashionable resort. Christchurch is a noble building. In length it exceeds "any of the Welsh, Irish, or Scotch cathedrals, and in England those of Rochester, Ripon, Oxford, Bristol, Carlisle, and Manchester." Like so many other churches, it exemplifies the variations of English architecture. The late Mackenzie Walcott wrote an excellent guide to the church, which to him was attractive for other than archaeological reasons, and in a small compass he was able to give much interesting information without employing a sentence that was verbose. A new edition having been called for Mr. Ferrey undertook the revision of the guide. He has gone over the book line by line, and the new edition consequently will secure an amount of confidence that was hardly possible before, for Mr. Walcott was supposed to have some of the weaknesses of enthusiastic lay archaeologists. From the association of his father with Christchurch, and his own enthusiasm for English church architecture, Mr. Ferrey must know every stone and mortar-joint in the building. He has operated on the book as carefully as if he had been restoring a church. The text, as he says, has been tenderly dealt with, and what has been added is in smaller type or in foot-notes. The guide is now both trustworthy and interesting; it is in a convenient form, is well printed, and embellished with a clear photograph.

**The Death** is announced of Baron Heinrich Ferstel, of Vienna, an honorary and corresponding member of the Royal Institute of British Architects, Royal Gold Medallist. Baron Ferstel was born at Vienna in 1828, and adopted the profession of an architect, in which he gained high honours. He designed several public buildings in his native city, and among them the Votive Church and new University. He was a correspondent of the Académie de Belgique and the Institut de France, &c.

## LEGAL.

**Supreme Court of Judicature.—Court of Appeal.—July 14.**(Before the MASTER OF THE ROLLS and Lords Justices  
COLTON and BOWEN.)**PARKER v. THE FIRST AVENUE HOTEL COMPANY, LIMITED.**

This was an action by the plaintiff, who occupies, for the purposes of his business as a photographer, the upper part of No. 40 High Holborn, to restrain an interference with his ancient lights by the defendant company in the erection of their new hotel. At the trial of the action during the Michaelmas sittings, 1882, Mr. Justice North granted an injunction, but introduced qualifying words so as to leave the defendant company at liberty to put on a sloping roof on that portion of their building which was immediately opposite to the plaintiff's side windows looking to the west, so long as the angle of incidence to the centre part of the plaintiff's windows was not less than 45 degrees above the point of incidence. The company were also not prevented from raising the walls north and south of the proposed sloping roof so long as they did not thereby darken, injure, or obstruct the plaintiff's ancient windows. The plaintiff, who desired to get an absolute prohibition against any building by the company above a certain height, had brought the present appeal for the purpose of getting the qualifying words introduced into the order by Mr. Justice North removed.

Mr. Finlay, Q.C., and Mr. Colt appeared in support of the appeal by the plaintiff; Mr. H. Matthews, Q.C., and Mr. Beddall for the respondents, the defendant company.

Lord Justice Cotton, in delivering the judgment of the Court, said that the learned judge of the Court below seemed to assume that it was a conclusion of law or necessary inference of fact that no building at an angle of 45 degrees would constitute an interference with the access of light. This idea was, however, erroneous. There could be no such conclusion of law, as it was a question which must depend on the facts of each case. The notion seemed to have been adopted in consequence of some of the provisions of the Metropolitan Building Act, but, if it proceeded upon any theory that so long as light was obtained from an angle of 45 degrees there could be no ground of complaint, the sooner that idea was got rid of the better. The order must be varied by substituting words which would restrain any interference with or obstruction of the plaintiff's ancient lights by the buildings of the defendant company to the south or north of the part covered by a sloping roof, and immediately opposite the plaintiff's side windows facing west either above or conjointly with the sloping roof. The order would also restrain the defendants from allowing to remain any building erected since the hearing in the Court below. The defendant company must undertake not to contend, if any application should be made by plaintiff for a sequestration against them for non-compliance with this order, that the obstruction was caused solely by the sloping roof.

## ART WORKMANSHIP.

**Cork Exhibition Medal.**—The premium of 5*l.*, offered in competition to all Ireland, in connection with above, for the best design for prize medal, has been awarded by the executive committee to Mr. Richard Lane, of the Ann Street Ironworks, Belfast. The medal is designed in Celtic style, as being more national. On the obverse is a foliated trefoil, in the centre of which is placed the city of Cork shield of arms. The space above, and on each side of the shield, is filled in with intricate scroll tracery characteristic of the style; while the spandrels between the trefoil and the circular band running round it are filled with interlaced work in the form of reptiles, having the following inscription and date: "Cork Industrial Exhibition, MDCCCLXXXIII." On the reverse is an ancient Irish harp, with scroll ribbon thrown across and partly entwined, bearing the words "Awarded to." Surrounding this is a band left blank for exhibitor's name, &c.; while outside all is a space divided into panels by circular and square bosses alternately, three of each, ornamented in character with the style; the panels, six in number, being filled with strap fretwork to correspond, varied in treatment.

**Beaconsfield Memorial Window.**—The committee of the Scottish Conservative Club, Edinburgh, have chosen the design of Messrs. James Ballantine & Son for a window commemorative of the Earl of Beaconsfield, which, at a cost of 300*l.*, is to be placed in the principal staircase of the new buildings of the club in Princes Street. The window is in three compartments, of which that in the centre is twelve and the two others eight feet high. The large central design is a majestic female figure, wearing a crown, intended to illustrate the *Historic or Regal Empire of Britain*, and typical of the Conservative or Constitutional spirit of the party. Firmly held by the right hand is a governing sceptre; the other hand rests upon a sheathed sword; the national quarterings are displayed on the breast, and the rose, thistle, and shamrock are embroidered upon the robe. St. Stephen's and Westminster are seen in the background, and beneath is the

Roman motto, "Imperium et Libertas," adopted by the Earl of Beaconsfield as embodying the programme of his Ministry. The treatment of the whole design is that of the Italian Renaissance period, in accordance with the architecture of the building.

**Stained Glass, Lerwick Town Hall.**—Some stained glass windows have been just erected in the new Town Hall of Lerwick, in the Orkneys, by Messrs. Cox, Sons, Buckley & Co., of London. The windows are in the front of the great hall of the edifice. They are of two lights each, and the subjects represented in them are as follows: No. 1. In one light is the figure of King Harold Hardrada of Norway; in the other is that of Earl Magnus, to whom, under the title of St. Magnus, the cathedral of Kirkwall is dedicated. No. 2. In one light is King Olaf Tryggvison of Norway, the Christian civiliser of Norway and the North; in the other is Queen Thyri, also of Norway. Both these personages are mentioned in Longfellow's poems. No. 3. In this window are represented King Hakon Hakonson of Norway, and the Jarl Rögnbold, the Crusader. No. 4. Herein are the figures of King James III. of Scotland and of the Princess Margaret of Orkney. All these figures, besides armorial bearings in four windows, which are now in course of execution in the studio of the firm, are executed in the best style, and in rich old colours.

## TOWNS IMPROVEMENT.

**Finsbury Park Baths.**—These baths, which were opened last week, have been erected by Mr. P. J. McManus, Brook Green, Hammersmith, from drawings prepared by Mr. J. P. Bennett, architect. The engineering arrangements have been carried out by Messrs. Thos. Bradford & Co., of London, Manchester, and Liverpool, the heating of the two swimming baths, and the supply of all the hot water for the forty-one private baths, being worked from two high-pressure Cornish boilers fixed in the basement of the building. The gentlemen's swimming bath is 77 feet long by 28 feet wide, the ladies' swimming bath being 24 feet long by 8 feet 6 inches wide, and the engineers have arranged for heating them by injection of high-pressure steam from the boilers, and, judging from the result at the opening, it is both simple and effective; in fact, we understand that, when cold water and steam are turned on simultaneously, the plunge baths, when full, are warm enough for swimming purposes, the temperature registering 70° F. There is a total of forty-one private baths, made of porcelain, which are all supplied with hot and cold water, and each one is fitted with one of Bradford's patent bath-valves, so constructed that either hot or cold water can be turned on separately or any proportion of each, and by an ingenious arrangement outside the bath the attendant can see the temperature of the water going into the bath, and can regulate the same so as to flow into the bath at any given temperature from 60° to 180° F. The hot, cold, and waste services are all readily accessible, and, as may be imagined, are very extensive. We notice that there is no lack of hot water, for in the boiler-house one of Bradford & Co.'s water-heaters is in operation. The whole being worked by only two boilers will, we think, prove both an economical and effective engineering scheme. The towels and bathers' drawers used will be washed on the premises, a complete set of Bradford & Co.'s plant being used, the towels being boiled by steam in special troughs—a very cleanly and effective arrangement. The drying-closet is also heated by a powerful steam coil supplied from the boilers, the moisture being carried away by a powerful ventilating arrangement.

## CHURCH BUILDING AND RESTORATION.

**Halam.**—A bazaar has lately been held in aid of the funds for the restoration of Halam church, near Southwell. The church is an old building, and the chancel arch and tower are interesting specimens of Norman architecture. The tower is low and stunted—a special characteristic of Norman architecture. These are the only remains of the first church which was erected there. In the south wall of the nave three arches were inserted for an aisle which was to have been built, but the work was not carried out. In the restoration it is proposed to build it. The arches are of beautiful design, and have remained in their original perfection, built up inside the wall, since the thirteenth century. A vestry and organ chamber will also be added. The tower will be raised by battlements, and a conical roof will be introduced. It is estimated that the whole of this work will cost 1,495*l.* The architect for the work is Mr. Ewan Christian.

**Starcross.**—The memorial-stone of a chapel at the Western Counties' Idiot Asylum, Starcross, Exeter, has been laid. The chapel will be situated at the rear of the building, and be approached through the present dining-hall. The basement of the new building, of which the chapel will form the principal portion, consists of a newly-erected workshop, which will be devoted to mat-making, brush-making, and tailoring. The latter trade, as well as shoe-making, is already carried on. The new structure

will be 50 feet in length by 18 feet 6 inches wide, and the workshop will be 9 feet in height. Between it and the chapel there will be a solid ceiling of concrete, so as to deaden all sound. The chapel itself will be 19 feet in height, and externally it will be of a plain Gothic type, in harmony with the adjoining buildings. The outer walls will be of limestone, with Beer stone dressings. Messrs. J. W. Rowell & Co., of Newton Abbot, are the architects; Messrs. Stacey, also of Newton Abbot, are the builders. The amount of the contract is 750*l*. The new chapel will accommodate 100 persons.

**Cheadle Hulme.**—The memorial-stone of a Wesleyan chapel and Sunday-school at Cheadle Hulme have been laid. The chapel is being erected within a short distance of the old building, from the designs of Mr. J. S. Whittington, architect, Manchester, the contractor being Mr. J. Whitley, of Blackley. It is to provide accommodation for more than 300 persons. The school will be immediately behind the chapel, and is arranged for 200 children.

**Richmond.**—The foundation-stone of a Congregational church at Richmond, Yorkshire, has been laid. The new buildings are to be erected on a site given by the Earl of Zetland. A school and class-room will be erected adjoining the church. The architects, Messrs. Clark & Moscrop, of Darlington, have adopted an Early Perpendicular style of architecture in keeping with the beautiful traceried fifteenth and sixteenth century work at St. Mary's Church, and the tower of Grey Friars adjoining the site. An octagonal tower, with long traceried belfry windows, embattled parapet, and lofty slated spire rising from the south-west corner, will form a conspicuous object in the district.

**Huddersfield.**—The foundation-stone of a new chancel, which is to be added to the church of St. Paul, has been laid. Besides the erection of a chancel, it is also intended to effect considerable alterations and additions to the interior of the church, which for some time past has been ill adapted for devotional services. The church, which was built about fifty years ago, is in the Early English style of architecture, and consists of nave and chancel, and has a tower in the centre of the west end. The old chancel was, however, very limited in area. The exterior work has been designed in keeping with the old building; the interior work is of a more decorative character. The contracts have been let to the following firms: Mason's work, Messrs. B. Graham & Nephew; joiner's work, Mr. J. Christie; plumber's work, Messrs. Brook & North; plasterer's work, Mr. W. E. Jowitt; slater's work, Messrs. W. Goodwin & Sons; painter's work, Mr. Sam Kendall; and the warming apparatus will be supplied by Messrs. W. and S. Thornton & Son, all of Huddersfield. It is estimated that the total cost will reach 4,500*l*. Messrs. John Kirk & Sons, of Huddersfield and Dewsbury, are the architects.

**Bacup.**—The Church of St. John the Evangelist, built on the site of the old church, which was pulled down, has been opened. The new church has been built of the best and most durable stone procurable. The site being irregular and sloping has influenced the design of the building to some extent. The church accommodates between 800 and 900 adults, and consists of a nave, chancel, north and south nave aisles, north chancel aisle, and a western narthex and baptistery. The tower, a portion only of which is at present built, is placed at the highest part of the site, on the south-west corner of the building. The ground, falling rapidly from west to east, has afforded space for a crypt or basement storey below the chancel, which is used as parish room and vestries. The nave floor line, following many ancient precedents on similar sites, also slopes down towards the chancel step. The nave, chancel, and narthex are of the same width, forming a parallelogram about 120 feet in length, and 27 feet broad. The walls internally are almost entirely faced with dressed ashlar stone. The roofs are open-timbered, boarded, and felted, of the kind known as "hammer-beam," that in the chancel being more ornate than the nave. The nave is about 67 feet long, and is divided from the aisles by arcades of four bays. The contractors for the masonry are Messrs. James Hargreaves & Co. The woodwork is done by Mr. J. Plane, and the slating by Mr. J. Rushton. The plumber is Mr. Robert Clegg, for whom Messrs. Edmondson & Co. have executed the glazing. The architects are Messrs. Medland & Henry Taylor, of Manchester.

### SCHOOL BUILDINGS.

**Derby.**—The memorial-stones of buildings for the accommodation of Sunday and day scholars have been laid. The total cost of the building will be about 2,700*l*., including cost of land, furnishing, &c. There will be four large class-rooms on the ground floor, and a large room on the second storey, and the new building will afford accommodation for 700 children. The architect is Mr. F. C. Coulthurst, and the builder Mr. Hewitt, both of Derby.

**Hastings.**—The new buildings for the Hastings Grammar School have been opened. Owing to want of funds the whole of the intended scheme has not yet been carried out. The section of the work now completed contains the large school-room, with

raised platform at one end and a gallery at the other, for the distribution of prizes and other ceremonies that may take place. Adjoining this room are the class-rooms, four in number. Above the large rooms is space for twenty cubicles, which will not, however, be fitted up for use until the completion of the second section. The space beneath the large room, arising from the slope of the ground, is made use of for a covered playground. Section No. 2 will comprise the master's residence and accommodation for thirty boarders, consisting of dining-hall, dormitories, &c. The buildings have been erected by Messrs. Howell & Son, of Hastings, under the superintendence and from the designs of Messrs. Jeffery & Skiller, architects, also of Hastings, the materials used being Kentish rag with Bath stone dressings. The heating of the large rooms and corridors is effected by hot air on the principle by Messrs. Grundy, and that of the class-rooms by Boyd's hygienic ventilating school grates; there are also ample means for introducing fresh cold air into the buildings. The estimated cost of the entire scheme when completed is 10,000*l*., of which amount somewhat over 5,000*l*. has been expended on the present part with its approaches.

**Halifax.**—The foundation-stone of a new Primitive Methodist Sunday-school has been laid at Halifax. The school is being built from designs by Messrs. George Buckley & Son, of Halifax, and will be a Gothic structure. The cost will be about 4,000*l*., but this sum includes the purchase of land and buildings.

### GENERAL.

**The City of Manchester Art Gallery** exhibition of works of modern artists will be opened on Tuesday, September 4, and will remain open until December 11.

**The Corporation of Liverpool** autumn exhibition of modern pictures in oil and water-colours will open in the Walker Art Gallery on Monday, September 3. The dates for receiving pictures are from August 1 to 11, both inclusive.

**A Sculptor**, named William Francis, while engaged on Saturday in putting up a statue at the side of the Roman Catholic Cathedral, Limerick, accidentally missed his footing and fell from a height of 100 feet. He was killed instantly.

**Strawberry Hill.**—Messrs. Ventom, Bull & Cooper have disposed of this estate to Baron H. de Stern, who has purchased it for occupation, so that the house, fortunately, will be preserved.

**The Beckford Library Sale** of twelve continuous days was brought to a close on Saturday by Messrs. Sotheby, Wilkinson & Hodge. The total of the twelve days' sale amounted to 12,852*l*., which brings the grand total up to the large figure of 65,705*l*. 8*s*. 6*d*. The remaining portion of the library will be brought forward some time towards the end of the present year.

**Sir Frederick Leighton, P.R.A.**, has resigned the command of the Artists' Corps of Volunteers, which he has so long, zealously, and honourably held. He is succeeded by Major Edis.

**The Canterbury Local Tait Memorial Committee** have decided to adopt the plans of Mr. Scott, and to place four sedilia on either side of the cathedral altar, with a canopied sedile for the Archbishop. Canopies for the eight sedilia were strongly advocated, but it was deemed prudent to leave that question to the architect, as well as the further question whether the memorial should be in oak or stone.

**The Memorial-stone** of the new Museum and Art Gallery in Queen's Park, Manchester, was laid on Saturday by the Mayor. The cost of the building, which is to have a floor space of over 12,000 feet, will be about 6,500*l*. The building has been designed by Mr. J. Allison, the city surveyor, and will be Gothic in style.

**Statues for the Sanctuary** of Ratcliff College Chapel, Leicester, were unveiled last week, the whole having been presented by "old boys" of the college. This completes the work designed by Messrs. Pugin & Pugin. The statues are the work of Mr. Roddis, of Birmingham.

**An Excellent Work** by Mr. Hamo Thornycroft, A.R.A., in this year's Academy exhibition, is a bronze bust of Mr. John Belcher, jun., the architect. It is a faithful likeness, and the daily and weekly press have extolled it as a fine example of the eminent sculptor's method.

**The Meeting** of the proprietors of Drury Lane Theatre was held on Saturday. The chairman stated that the architect of the Metropolitan Board had expressed his satisfaction as to the manner in which the alterations had been executed, and, from his own observations, he could, without fear of contradiction, assert that Drury Lane Theatre was better provided with exits in case of alarm or panic than any theatre he had ever visited.

**Messrs. W. & J. Burrow** have removed their offices from 3 Mark Lane Square to Corn Exchange Buildings, 15 Seething Lane.

**The Municipality of Paris** have entered into a contract with Messrs. Stuart & Co., Edinburgh, to lay with granolithic the pavement in front of the Mairie of the Fourth Arrondissement, Rue de Rivoli. Messrs. Stuart & Co. have also contracted to pave in the same manner a space some 150 yards long in the city of Cologne.

LETTERS PATENT

ESTABLISHED A.D. 1774.

**AUSTIN'S**

NEW IMPERIAL PATENT

**SUPERFINE FLAX LINE.**

The above article is now being manufactured and sold in large  
quantities for Greenhouse Sashes, Public-house Shutters, and  
other heavy work. The Manufacturers would recommend it for  
its strength, and the large amount of wear in it, consequent on its  
peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND  
BLIND LINES (two Prize Medals awarded). The Manufacturers  
of the above articles particularly wish to draw the attention of  
the trade to their Imperial Patent Flax Sash Lines, of which  
they are now making five qualities; and they strongly recommend  
that in all cases they should be purchased in preference to the  
patent lines made from jute, which article has neither the strength  
nor the durability of flax, consequently cannot give so much  
satisfaction to the consumer.

They also invite the particular attention of the trade to their  
IMPERIAL PATENT BLIND LINES, which are very superior  
to anything yet offered.

They can be obtained of all Rope-makers, Ironmongers, Mer-  
chants, Factors, and Wholesale Houses in town or country.

N.B.—Please note that all our goods as advertised above are  
labelled either inside or outside with our Trade Mark—The  
"ANCHOR."

"THE MARBLE STORES."

**WORSHIP STREET, E.C. (BUILDING  
SITE).**—To be LET, on 99 years' Building Lease, a SITE  
having 35 feet frontage to Worship Street, with large space in the  
rear, covering an area of upwards of 12,500 feet, and well cir-  
cumstanced as to lights.—For terms apply to Mr. ALFRED  
RICHARDS, Auctioneer, 8 New Broad Street.

**CUSTOM HOUSE and WOOL QUAYS**, Lower  
Thames Street, E.C., containing a total superficial area of  
about 37,800 feet, with a river frontage of 240 feet, to be Let as a  
whole or in two or three portions, on a Building Lease or Leases,  
for a term of 90 years.

For particulars apply to Mr. W. B. TOWSE, Fishmongers Hall;  
Mr. T. CHATFIELD CLARKE, Surveyor, 63 Bishopsgate Street  
Within; or Messrs. FULLER, HORSEY, SONS & CARSELL,  
11 Billiter Square.

**HALF-AN-ACRE of LAND** in Regent Street,  
London, to be SOLD, suitable for a Club, Theatre, Picture  
Gallery, Concert and Ball Room, Restaurant, Baths, Livery  
Stables, Riding School, Residential Chambers, or Church.—Apply  
to J. S. RUBINSTEIN, 5 Raymond's Buildings, Gray's Inn  
London, W.C.

Metal Trades and Engineering Exhibition, Agricultural Hall, London, July 5 to July 21.  
**STAND No. 140. ROW G.**

# LINDSAY'S IMPROVED PATENT REVERSIBLE TREADS & LANDINGS FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

In Hospitals, or places where it is desirable to be free from dust, the blocks can be placed close together, not leaving any cracks, so that the treads or landings can be swept or washed quite clean; also, if it be necessary to get light under a Staircase or Landing, rough glass blocks can be fitted in the Iron frames, side by side with the wood, and a subdued light thus obtained.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be re-filled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works,

**13, 14, & 15 SOUTH WHARF, PADDINGTON, LONDON, W.**

# The Architect.

## SOME DECISIONS OF INTEREST UNDER THE BUILDING ACT.

THE working of the Metropolitan Building Act, however carefully managed by the district surveyors, must be allowed to have its share of disputes, and we have to report from time to time cases which arise, chiefly in the police-courts, sometimes involving points of interest and sometimes not—we may say generally not. It happens just now, however, that a group of decisions have been recently given which are worthy of more than a passing report. One refers to asphalte roofs, a second to the question of the fireproof separation of suites of offices, a third to the enclosing of one-storey shops, a fourth to the hoarding-in of dangerous structures, and a fifth to the erection of timber merchants' stages.

It may be doubted whether the building public in general quite understand the fundamental principle upon which the legal administration of the Building Act rests. The district surveyor may properly be called, without any disrespect, an officer of police. The regulations of the Act of Parliament are his orders and instructions, and he must of course be fully qualified by experience to interpret their language, and in every proper way to apply them to all operations within his district; but his demands may be disputed to any extent, and then it is the police-magistrate, and not himself, who is master. Thus it comes about that the best way in which to look at any such question of controversy is to ask oneself what view of it the mind of a police-magistrate would be likely to take. It cannot of course be expected that the decisions of the police-courts upon building matters should be always such as to withstand the criticism of experts; but, as a rule, there is exhibited in them a combination of legal skill and good sense which is very much what the public interest requires, even if contrasted with technical knowledge; and when an appeal is occasionally taken to the superior courts, it can seldom be said that the result is more worthy of respect. A magistrate's decision, in fact, may be said to possess a twofold virtue; it is always likely to represent a fair common sense opinion, and at the same time it claims no inconvenient authority.

In dealing with the list of subjects which we have specified above, we will reverse their order. First, it has been decided that the staging which a timber merchant erects to accommodate his stacks of deals and planks cannot in effect be brought in any way under the control of the Building Act. It is not a "building" within the meaning of the Act. That is to say, the owner must take upon his own shoulders all risks connected with it. On the whole, we do not see why the public should be dissatisfied with this conclusion. No doubt it may be thought a matter of some danger, as regards fire, that such enormous masses of inflammable material should be piled up as they are in the thick of houses without any official control; but it would scarcely be the right thing to introduce the authority of a mere constructive surveyor by a legal fiction; it is better that there should be no control at all until public opinion provides the right sort.

Secondly, it having been argued that any building which is being pulled down without being hoarded in is *ipso facto* in a dangerous state, the decision of the magistrate goes to the contrary; and here again we think the common sense of the question has been declared. No doubt many such operations—perhaps most of them—require hoarding for the protection of passers-by, but there must be some which cannot be said to do so; and if the Act implies, as it seems distinctly to do, that the structure must be in itself dangerous as a condition precedent to the necessity for hoarding it in, it may be considered to follow that it is the dangerous state of the structure, and not the danger of the process of pulling it down, that demands the hoarding. That is to say, the Metropolitan Board is not responsible for the mere operation of pulling down a house. There is this to be said, no doubt, that a coroner's jury might possibly be found disposed to fix responsibility upon

some public officer, if it could be done; but we think the decision in the case before us is all the more valuable on that account. It might be a moot point whether a house which is being pulled down is not self-evidently a "dangerous structure" during the process, in so far that some official direction should be at command; but even then the authority of the Board under the present Act of Parliament seems to reach no further than the power of giving notice of the extent to which the pulling down ought to go in respect of any actual danger in the structure itself, supposing it were not to be pulled down at all.

Thirdly, the question how to construct the front of a shop which has been built one storey high over a previously open forecourt has been discussed and settled; we should have thought it had been settled long ago. It has been now decided thus: The enclosure of the front without a "wall" seems to be, strictly speaking, a matter for the license of the Metropolitan Board, as a thing not provided for in the ordinary regulations of the Act; but, inasmuch as thousands of such cases have been passed by the district surveyors in all quarters during many years past without such license, it is considered that the invariable approval of the Board in previous years must have established a rule thus acted upon. This is a purely legal point, and is well settled thus; but it seems to us that if the Board were to issue, upon various other questions besides this, some sort of unofficial by-laws for the guidance of district surveyors, so as to render unnecessary so many applications for special license, the building community would be thankful for a considerable saving of both trouble and time.

Fourthly, we may take the question of roof construction, which is in fact that of the use of the asphalte covering now becoming so common. It was doubted by the district surveyor whether, in view of the rule that all roofs must be "covered with incombustible material," asphalte could be so called. We may acknowledge this to be a difficult point; for most people are certainly under the impression that asphalte of all kinds will indisputably burn, if set on fire, while at the same time no one who has examined an ordinary asphalte roof could very well regard it as a thing that is practically in any danger of taking fire, any more than an asphalte pavement. So many asphalte roofs, indeed, are to be seen throughout London that one might readily suppose the point must have been settled authoritatively before the first of them was finished and passed; but this does not seem to be the fact, and the whole question had to be gone into last week. The district surveyor testified that he had actually experimented upon the material, and found that it burnt freely in a gas flame. This was admitted on the other side to be undeniable. But an expert chemist was called to go further into the matter, and, in consequence of his explanations, the magistrate had no difficulty in declaring his opinion to be—and we congratulate the party of progress upon it—that asphalte (of the kind used for a roof-covering over concrete) is "incombustible material" within the meaning of the statute. Professor ATTFIELD'S evidence went to show that, although there is in such asphalte a proportion of about 10 per cent. of mineral pitch which is directly combustible, and which may be burnt out by the direct application of flame, yet that the other 90 per cent. is earthy matter, quite incapable of being made to burn, and having, on the contrary, the property, like all other earthy matter, of extinguishing flame. As a roof covering, therefore, this asphalte, of about an inch in thickness, if it received fire from the outside (as by burning embers falling upon it from an adjoining house), would at the worst become softened and melted for such a time as the heat might last, producing flame wherever sufficient flame attacked the 10 per cent. of inflammable pitch, but this only to so slight an extent that the 90 per cent. of earthy matter would speedily gain the victory and extinguish it. So far, therefore, so well; but it seems clear that if asphalte in itself is "incombustible material" within the meaning of the Act, then it must be just as much so if laid upon boarding as if laid upon concrete; and this is a point that seems to require consideration, as probably no one would be prepared to encourage the formation of roof coverings by means of asphalte on wood.

Fifthly, we observe that a decision has been given to the effect that, in the case of new buildings which are divided into separately-occupied sets of chambers, the well-intentioned rule that the several suites shall be separated from each other by fireproof partitions and floors shall not apply when the "chambers" are merchants' offices. Now we are quite prepared to admit that there are particular quarters of the town

which require a kind of local interpretation of some of the rules of the Building Act; and possibly in the City (where the case in hand came up) it may be desirable to regard offices for trade and chambers for residence as distinguishable from each other in a way that is not forced upon one's notice elsewhere. But surely, if the intention of the Legislature may be taken to have been the prevention of the spread of fire amongst specifically separated tenements, occupied by persons of some importance, under one roof, the necessity for this in the case of the offices of merchants, lawyers, and others in new City buildings must be much greater instead of less than in the mere lodgings of gentlemen at the West End of the town. We observe that the decision, which was not given by a lawyer but by an alderman—and one who, as a builder, is perhaps the natural enemy of all Building Acts—is to be appealed against; and we cannot help thinking it will be a pity if the appeal should be unsuccessful. The very foremost purpose of the Building Act is to prevent the spread of fire; and if the safeguards which it provides, already far from being efficient, are to be overturned piecemeal upon legal quibbles (witness the notorious "Bristol case," which has done incalculable mischief), the time may come when it will be too late to seek a remedy. In fact, if building law is to be of any use at all, it is a thing to which mere legal refinements ought never to be applied, either on one side or on the other.

### M. JULES LEFEBVRE.

[BY A CORRESPONDENT.]

ON a winter evening of 1853, two lads arrived at one of the railway stations of Paris. They came from Amiens, and their object was to study art. In the pocket of one was a letter of introduction from Monseigneur the Bishop of their native town (Amiens) to M. GUÉRIN, professor of drawing at some unknown school. The boy, JULES LEFEBVRE by name, was strongly recommended by Monseigneur as of excellent character, and the son of worthy parents. His possessions consisted first of the letter, then of a bed and two chairs. His comrade had no letter, but he had a table and a *poêle*. Meanwhile they had a few francs to begin life with. The lads had never been in Paris. They wandered along the unknown streets until, at 50 Rue de l'Université, a *chambre à louer* caught their eye. They hired the room, fetched their furniture, and at once started in quest of M. GUÉRIN. That gentleman received the bearer of Monseigneur's letter with kindness, regretted his own inability to serve him, and wrote an introduction for him to COGNIET, whose *atelier* was the most popular and crowded of the time.

PAUL DELAROCHE, DURET the sculptor, DAVID D'ANGERS, HIPPOLYTE FLANDRIN, &c., had sat at the feet of the old master. To be admitted as his pupil was a distinction and a favour. To him went the country lad. The austere old professor glanced at the introduction and bid the boy attend next day at the studio. Thus, in 1853, commenced the career of JULES LEFEBVRE, for whose *Diane Surprise*, exhibited in 1883, the sum of 37,700 frs. was paid by Mr. DUNCAN, of Glasgow, who bid for it against the French Government, desirous to secure it for the country.

Let not young students imagine for a moment that M. LEFEBVRE leaped at a bound to the splendid position he has attained. From that first unpleasant morning among the Paris trained *élèves* of old COGNIET's *atelier* to the present hour, in the spacious studio of his private residence, 35 Rue la Bruyère, M. JULES LEFEBVRE's life has been one of severe study, unremitting labour, and persevering self-denial.

The lad had no patron, he depended on himself alone. To this fact, and to his own indomitable energy, may be attributed his triumph over difficulties which would have paralysed a less resolute nature. His steady work at COGNIET's attracted notice within nine months of his admission. A pension of forty pounds a year was bestowed on him by his native city of Amiens, which he enjoyed till 1859. This was his first step on the ladder of success. He passed the competitive examination for the Ecole des Beaux-Arts, and thenceforth, after study from life models at COGNIET's in the morning, attended the afternoon lectures at the School, strictly following the usual academic course. Eighteen months after his entrance he received the medal which exempts students from further examination, and was *reçu en loges* the year M. HENNER

carried off the Prix de Rome. He was only honourably mentioned. He therefore competed again the following summer, but was attacked by illness while making his sketch of the subject given, *Coriolanus among the Volscians*, and was compelled to return home. His comrades petitioned the Institute to grant him eight days' respite, which that body agreed to do. Young LEFEBVRE was carried on a mattress to his *loge*, and completed his drawing, which was accepted, but he was unable to bring his picture of the subject to perfection. He won the second prize, M. UHLMANN, whose *Cato in the Senate* has appeared in *The Architect*, being the successful prizeman of the year. In 1860 LEFEBVRE was beaten by ERNEST MICHEL, and victory only crowned his efforts in 1861, with his picture of *The Death of Priam*, which secured for him the Prix de Rome. Once in the Villa Medici, LEFEBVRE felt master of the situation and of his own future. Not for a second did he regret the wild student life of Paris. To the *étudiant du quartier Latin* the *trottoir* of the Boulevards is the pathway to paradise; the gas-encircled doors of public gardens and *cafés chantants* the gates of entrance to that desirable region. With this phase of student life LEFEBVRE had nothing in common. Art was his mistress. By her he was to live; to her he had devoted his life. At the Ecole he had striven to study from her purest sources of inspiration. At the Villa Medici he copied and sketched and painted, not with a view to the *qu'en dira-t-on* of a Paris exhibition, but with the earnest desire for the sake of art to draw from the masters of the old schools the secret of their influence on succeeding ages. The first year of his sojourn at the Villa he obtained permission to substitute a classic subject for the one ordered to be sent home, namely, a copy of WINTERHALTER's portrait of *Napoleon III.*, for the obvious reason that he had already made a copy of that work which had brought him in the first sum of money art had acquired for him. For the said copy, finished a few weeks before he had left France, he received fifty pounds. This was enormous in the eyes of the young student—a sum not to be spent on *parties fines*, but first in defraying some trifling debts contracted in the service of art on painting materials and extra hours of models, and then on the purchase of two shares in the Ville de Paris, which he severally gave to his young sister and brother, remarking as he did so that, having won *le Prix de Rome*, his own material wants were provided for; therefore that he left France with an empty purse but a light heart. Luck from that hour chose him for her favourite.

In place of the copy of the Emperor's portrait ordered by the Ecole for the 1863 *envoi*, LEFEBVRE sent *Charité Romaine* and *La Baigneuse*, since acquired by M. PELPEL. In 1864 he sent *Jeune Fille Endormie*, now the property of M. DESVALLIÈRES, and *Nymphé et Bacchus*, which belongs to the Luxembourg. The former was considered as one of the most remarkable works of the Salon, on account of the delicacy of its execution, the truth of its colouring, and the *maestria* of its draughtsmanship. The tone in the flesh-tints was transparent and soft, in spite of its solid quality, and the colouring brilliant. *Nymphé et Bacchus* was not exhibited till 1866. The nymph is depicted in a sportive mood. She is fair, as is the custom of Dryads, and is seated on a rock in the Sacred Wood. Her Aunt Io has entrusted young BACCHUS to her care. She wishes to make of the child god a mighty hunter, unaware of his as yet undeveloped proclivities as regards the juice of the vine. She holds the bow with which she has shot a bird high above her head. The figure of the child, in his effort to catch both, is thrown back, hence a difficult and admirably given position of both her and his arms. A bust of antique form, exactly opposite young BACCHUS, seems to deride his ineffectual efforts to capture the bow and the game. In 1865 LEFEBVRE sent home *Le jeune Homme peignant un Masque Tragique*. The young Greek is nude. His back is towards the spectators; a scarf is thrown across his figure, and falls in an horizontal line from the right shoulder; from beneath a close cap his hair falls in rich locks; he smiles as he paints the huge mask on an easel before him. Very beautiful is the line of his left arm and hand, in which latter is the paint-jar. His left knee rests on a stool covered by a panther's skin. Three masks, grotesque in expression, and indeed even comic, lie on the ground behind his easel. The town of Auxerre bought *Le Peintre des Masques*. Princess MATHILDE purchased a small *tableau de genre* exhibited the same year, but inferior in merit to the mask painter.

During nine months of the year 1866, LEFEBVRE shut himself into the uninhabited convent of the Santi Salvi, at Florence, for the purpose of making the splendid reproduction,

of ANDREA DEL SARTO's fresco painted for the monks in 1527, which copy may be seen at the Ecole des Beaux-Arts, in the Galerie de Melpomene. The statutes of the Ecole require each student of the Villa Medici to annually send home two works measuring 2 mètres by 1-80. The frieze which JULES LEFEBVRE resolved to copy for the enlightenment of future generations of art students, measures 9 mètres. The formidable nature of the undertaking acted as an incentive to his ambition. Having consulted M. GÉROME as to the work and his chances of success, he took up his abode in the damp and bitterly cold refectory, to the adornment of which ANDREA DEL SARTO devoted his last efforts. A *brasero*, heated by vine twigs, was the only means by which, during the winter months, LEFEBVRE succeeded in restoring animation to his benumbed fingers; but the marvellous beauty of *Le Cénacle* rendered him indifferent to physical discomfort. The story of the frieze is curious. Three years after its completion Florence was sacked by the Imperialists. Greed tempted the free lances to sack convents, wherein they were secure of goodly booty among jewelled chalices and chiselled *aiguères*. When the victorious Teutons burst open the door of the refectory of the Santi Salvi, a cry of admiration burst from their ranks, and while carrying off what else the hall contained, they scrupulously refrained from injuring the old master's *chef-d'œuvre*. After the war was over, the convent was given to an order of *donne nobili*. To these virgins a refectory on the walls of which men, in light and airy vesture, were painted, was a scandal not to be endured an hour. Straightway the lady abbess commanded that the linen stores of the community be searched for a piece, of size adequate to conceal not only from her and her nuns the unholy spectacle, but from that of the abbesses and nuns of the future. Thus it has come to pass that for three centuries ANDREA's beautiful frieze has been carefully guarded from injury by dust or light; and till the city of Florence, in 1826, purchased the convent, the eyes of neither holy nun nor saintly friar were tempted to stray from virtue's narrow path by the contemplation of *Le Cénacle*. It deserves to be recorded that to execute the copy now to be seen at the Ecole des Beaux-Arts not only absorbed the 10*l.* a month allowed to LEFEBVRE, as student of the Villa Medici, but cost him money. No pecuniary consideration, however, hindered the completion of the work. For art's sake he undertook and completed it.

(To be continued.)

## ST. PAUL'S CATHEDRAL.

BY ROGER T. CONDER.

AS the committee for the decoration of St. Paul's Cathedral have commissioned certain well-known artists to prepare designs for the ornamentation of the dome, and these artists are at the present time engaged in the preparation of these designs, I venture with much diffidence to propose an alteration in the form of the four segmental arches, which at present, as is almost universally admitted, disfigure this magnificent work of Sir CHRISTOPHER WREN.

I should hardly venture on such a course as to suggest that anything that WREN ever did could by any possibility have been better done, if it were not that in this particular instance of the arches to the dome no less an authority than Mr. FERGUSSON has spoken of them, in his "History of Architecture," in terms of decided condemnation, to say nothing of what has been said by other critics with more or less claim to public attention.

Mr. FERGUSSON, after referring to the four great arches over the openings to choir, transepts, and nave, says:—

It was impossible that the alternate arches of the dome could be 40 feet wide below, and as they must spring from the same level and reach the same height, a variety of mechanical expedients were necessary, which have become real deformities in practice. They might to some extent be remedied now—for instance, by introducing two pillars standing free and carrying the entablature horizontally across, and supporting a real tribune, with a bold balcony in front, in place of the present curved cornice, or by some such expedient.

Again, in a paper read before the Royal Institute of British Architects, on May 30, 1859, Mr. WIGHTWICK referred to these arches in the following terms:—

The Whispering Gallery of St. Paul's, with all above it, leaves nothing in the way of architectural forms to be desired, though there are many who

think the character of painting adopted most injudicious. Below the gallery, however, criticism rests dissatisfied, if not offended; the four diagonal sides of the octagon beneath the tambour of the cupola evincing an aim at more than the artist has successfully accomplished. To obtain an appearance of open lightness developing the architecture and vaulting of the aisle behind them, these diagonal compartments are woefully cut up and finished with ingenuity at the cost of judgment. It had been better if these compartments had simply exhibited repetitions of what is practised in the nave, choir, and transepts, so far at least as was possible. There is no occasion for more than simple reference to defects which have ever been obvious to the critical eye. The confusion of these parts is positively so distressing that alteration would be justifiable—only taking scrupulous care that it be effected by that repetition of Wren's own, to which allusion has just been made. St. Peter's had many architects. The substitution of a better piece of Wren for another in the same building would not disturb the oneness of itself or its designer.

Mr. WIGHTWICK, who gave utterance to these sentiments, spoke in this same paper of the dome in terms of the highest praise, referring to it as "indeed the very crown of England's architectural glory," a fact which shows that his criticism of these arches was not prompted by any petty feeling of hostile criticism.

In suggesting any alteration to a public and national monument of the nature of St. Paul's Cathedral, the masterpiece of one of our greatest architects, and one of the most beautiful churches in Christendom, we have to meet with the opposition not only of those who consider that that monument is entirely beautiful in itself, and perfect in every particular, but also of many who, whilst they may admit a defect here and there, do not consider these defects of sufficient importance to justify us in altering the work of our ancestors in any respect—even though they were of the grossest description. In fact, some consider that such a building should be kept intact as a national and historical monument. Whilst admitting the relevancy of this objection in many cases, I consider that there are and must be many exceptions to the application of such a rule; as, for example, when a building has fallen into a dangerous state of disrepair, and also in such a case as St. Paul's Cathedral. For this reason. St. Paul's is essentially a modern building, and it is the argument of those who wish to decorate the building that it is not *complete*, and will not be till it is decorated. This view is generally held by the public at the present time. The cathedral church of St. Peter at Rome was erected under the superintendence of several architects, who did not each feel bound in every particular by the intentions of his predecessor, but carried out slight alterations.

If this was done at St. Peter's, there can be no reason why it should not be done at St. Paul's also. The cathedral is more a *national* monument than a monument to the genius of Sir CHRISTOPHER WREN, and I consider that a serious defect, such as these segmental arches admittedly are, should be set right before the artist is employed to decorate the architect's work.

The accompanying illustrations show a proposed alteration of these arches, which will be found to correspond very much with the suggestion made in Mr. WIGHTWICK's paper read before the Institute of Architects; for the compartments, as shown on this drawing, simply exhibit "repetitions of what is practised in the nave, choir, and transepts," and the alteration would simply consist of "substituting one portion of WREN's work for another," which is condemned.

The arch as shown on the drawing would be of the same span as the aisle arches in the transepts; the only difference would be that the soffit of this arch would consist of one arch only instead of two grouped together, though this soffit would necessarily be broader than the soffit of each of the single arches grouped together to carry the aisle arches, and would rest upon a single pilaster to correspond. This would be necessary in order not to interfere with the passage-way into the aisles of the choir and nave from the dome, by the insertion of coupled pilasters and arches.

A reference to the plan will show that these pilasters would in no way interfere with free access to the aisles.

The view up the aisles would not be interfered with in any respect, whilst this positive advantage would accrue, that the arch being placed at this lower level, the attention of a person standing in the aisles of the nave looking eastward would be attracted to this arch, and would be gradually led away into a recognition and appreciation of the fact of the existence of the great space of the dome, which is the point in which the whole interest of the church is centred, and up to which all the rest of the architecture leads.

Another great advantage that would be gained by this alteration is the following: If the jambs of the balcony open-

ings were arched over in such a manner as shown in the drawing—being an arch struck from the same centre as the main arch supporting the dome—the apparent strength that such an arrangement would give to the point of springing of the eight great arches supporting the dome would be of inestimable value. These eight springing points at present give one an impression of weakness and insecurity. The arch over the balcony would present a fitting place for the mosaicist; and supposing the eight large spandrels between the eight great arches were suitably decorated in mosaic or painting, the arches would stand out distinct, and the combined alterations would give an appearance of strength and simplicity which these supports to the dome at present lack.

The only objections that would be likely to be raised to the alteration, beyond the objection to altering anything whatever in what Sir CHRISTOPHER WREN built, would be:—

1. That some might consider the view up the aisles interfered with. I think, however, on reference to the plan that this would be found not to be the case to the slightest extent, in so far as the view up the aisles themselves is concerned, and anyone that knows St. Paul's knows that no view is to be obtained up the choir aisles either from the nave or dome.

2. The comparative thinness of the proposed new arch might also be raised as an objection; but I do not think that this objection would be sufficient to condemn the proposal.

In making this suggestion I feel that when such a very slight alteration is wanted—and that to carry out the very idea that Sir CHRISTOPHER WREN himself would in all probability have carried out had he not been in an unfortunate moment seized with an extremely ingenious idea—no mere idea of respect for the memory of the genius who designed this building should stand in the way of removing such blots on a magnificent national monument.

To decorate these arches would be simply a lamentable waste of time, labour, and precious material; and if they were left in position, either decorated or undecorated, they would go a long way to mar the effect of the whole dome after it had been decorated—to as great, if not to a greater extent, than they do at the present time.

## STUDIES OF SOME LONDON CHURCHES.

(Continued from page 32.)

THE Church of St. Mark, East Street, Walworth, has about the widest nave of any in London, *i.e.* 37 feet. It is of considerable height, and externally, as one stands at the west end, there is no sign of any aisles. A hyper-critic might therefore say that the principle of design was wrong, as it did not reveal its true story. But in this case two objects for the treatment adopted evidently existed. There can be no doubt the long unbroken roof which covers both nave and aisles is cheaper than a break in the line. As there are other buildings which about the church at the west end, and the sides are thus hemmed in and concealed from outward view (there being no roads north and south), the side elevations had not to be much regarded. Far from it that any part of God's House should appear neglected and uncared for. But it was no object when funds were very limited to give an ornamental appearance "to waste its sweetness on the desert air," *i.e.* the back yards of artisans' cottages. It may be said Art ought to penetrate everywhere, but at present that happy consummation has not been reached, and it is better to try and reform the so-called Art which too often blazons itself in great London thoroughfares, rather than to exhibit it where not one in a hundred will ever give it an appreciative glance. From what has been said, it will have been gathered that no clerestory to St. Mark's Church exists. Sufficient light is obtained by means of lancets to the aisles, and through a large traceried window at the east end of the chancel. The tracery of this latter is of rather too intricate and elaborate a device to harmonise with the simple severe lancet treatment elsewhere adopted. Granted it is proper to make the east window the richest and most ornamental in the church, there are modes of doing this in the Lancet style; witness the exquisite examples at Rievaulx and Whitby Abbeys, with the lurking dogs' teeth in the deep-set hollows. The manner in which the porches at the western end of St. Mark's are planned is very good. The end of the aisles is walled off, and doorways into the church face north and south respectively, the outer porch

being to the west. There is likewise a central west door, with out lobby or porch, intended to be used only for egress. This arrangement, though not unique, is not so generally adopted as it should be, for by its means the penetration of cold and draughts is to a large extent prevented, and it is superior to the pretentious "narthex." The latter is frequently adopted in combination with showy façades, and generally leads into an interior miserably belying the ambitious entrance portals. There can be no more fatal mistake than this, misleading the worshipper by making the outside of the platter clean and spruce, and disappointing him when he finds the Temple itself so inferior to its threshold. We do not find it so in Mediæval examples. If the doorways are stately and magnificent, the interior is as a rule at least equal to them in appearance and detail, if not superior. The actual place where prayer and praise is offered up is surely the more fit for architectural embellishment. Although the west end of the nave and aisles of our subject are all flush, the roofs of the latter—*i.e.* over the porches—are hipped back. This has the effect of giving greater height to the nave, viewed externally. The church is lined with stock bricks, naturally treated, the endeavour throughout having been to build economically, but effectively, on small means. The wood cradle-shaped roofs are ceiled and have tie-rods, but no king-rods. The aisles have flat ceilings constructed of V-jointed boarding with a plain chamfered wall-plate, and are certainly rather poor. At the period when the writer inspected the church the aisles, which are about six or seven feet wide, were without fixed benches. To sum up the merits of this structure, though the detail of the work is not equal to the general design, notably in the mouldings to the nave-piers and to the chancel arch capitals, the proportions are good and well-studied. Much ingenuity has been displayed in working on Mediæval lines, while adapting them to the requirements of the Church of England. We see no tame copy of a church of the Middle Ages; but one displaying, as it ought to do, the spirit of the times in which our lot is cast.

The Church of St. Michael, Shoreditch, is well known, no doubt, to the student of modern ecclesiastical architecture, for it has been built some years, being about the first erected of that noble group whose forms were moulded by the genius of a BROOKS. It is, however, of a rather different character to the later works of the same master—*i.e.* St. Chad's, Haggerston; or St. Columba, Kingsland Road. From the outside the church favourably impresses the spectator, who will not fail to observe the picturesque and richly-treated bell-turret, well placed over the east wall of the nave in the situation where of old was the Sanctus bell-cot. Internally this feature is equally effective, set on a kind of double chancel arch, which prevents its being flimsy in substance, a far too common fault. The bell is rung just within the chancel gates by a man wearing a surplice, facing east. Is not this a vast improvement on the practice common fifty years since and still prevalent in many a church, where four or five men in their shirt-sleeves ring a lusty peal up out of sight and beyond control, on the belfry stage? In this case, when the ringer has done his office, he walks into the chancel seats, and takes his place among the choir men, thus aiding in another capacity the reverent conduct of the services. It is to be regretted that architects do not more often place the bell turret over the chancel arch and make a special provision, showing internally, for carrying it. This, then, might often lead to telling combinations. The nave arcade of St. Michael's is very "severe," as in order that the walls may properly sit on the cylindrical piers an unusually large chamfer has been used, or, in other words, a regular-sided octagon has been placed over the circular plan. Mr. BROOKS, like Mr. BUTTERFIELD, rather affects plain open-timbered roofs with lath and plaster between the rafters, and in the chancel of this church one cannot but wish there was something a little richer. Surely the roof of a fine, stately structure, its crowning point, ought not to be the plainest portion of the whole composition. It was not thus that the Middle Age men designed. The scene, when the writer visited this church one Eastertide, was most impressive—the lighted candles borne in procession by the choir, the smoke of the incense, the Paschal candle burning clearly on the north side. The last is a practice of the Early Christian Church revived, for it need scarcely be said that in many of the earliest churches of the "Eternal City," the beautiful Paschal candlestick still remains to charm our eyes.

Still keeping to the east of London a visit may well be paid to a church of no extraordinary character, St. Benet's,

Mile End Road, substantially built of red brick and church-like in its arrangements, as are all those designed by the architect (MR. CHRISTIAN). Both the tower and spire require greater height to be effective, but the absence of this is for a common reason, namely, want of money. There is a very large and spacious vestibule to the west end, extending the whole width of the church, with three doors. The interior of the building is of red brick. The piers of the nave arcade are raised on bases too high to look well. The manner, also, in which the irregular-sided octagonal capitals, *i.e.* four wide sides and four narrow sides, rest on the circular bells, is not very happy, as the change of plan is sudden instead of gradual, the octagon blending insensibly into the round. The pulpit is of an unusual plan and about 6 feet long; it is an oblong, the long side facing west, there being broad steps up from the chancel, the whole length of the pulpit, which is corbelled out into the nave by means of a ribbed cove. No particular beauty exists in this arrangement, which was probably suggested by some expressed wish of the usual occupant of the pulpit. It reminds one of the immense Continental examples, where the impassioned preacher can walk to and fro and address himself in succession to different sections of the worshippers, finding abundance of space in which to declaim with the utmost vehemence and action instead of being confined within very narrow limits.

Another church, not far from St. Benet's, is worth inspecting—*St. Matthew's*, Stepney. It is plainly and substantially built of brick, with an evident eye to economy. The exterior has little in it to attract observation or comment. The bricks and masonry are cut as little as possible, so that in the window tracery the appearance is somewhat crude. There is another feature, no doubt adopted to save cost, but which at the same time is effective, *i.e.* the side walls are of fair thickness, but divided into panels by segmental pointed arches. The capitals to the nave arcade are octagonal, with the four wide sides facing the cardinal points and four narrow angular sides. The transition from the octagon plan to the round seems well managed. The capitals support square-edged brick arches with an inner square stone order. The chancel arch respond pier does not come down to the floor, but is corbelled back by a series of square brick set-offs. In such an important position it would surely have been better to have employed some treatment a little less severe. Taking this church as a whole, it is a good, honest building, well adapted to its purpose, and perhaps better suited to the class of worshippers likely to be present there than a structure of a grander type, which is apt to frighten a poor person.

The *Church of St. Andrew*, Fulham, has some rather unusual features. For example, the spire is of brick. This can be little less costly than stone, and is certainly not so pleasing in appearance as a slate or tile covering, or even a lead-covered spire. The natural manner, however, in which throughout this building the bricks are treated—that is, without being cut—is satisfactory. In the east front this is especially noticeable, though monotony is avoided by a few chamfered set-offs. Some of the slit windows instead of being arched over, or having stone heads, have over-sailing courses of brickwork. Although the east gable cross is not very well proportioned, the design is original and ingenious, the emblem of the patron saint's cross being introduced within a vesica. A rather rich pattern of sgraffito is introduced internally to the stone soffits of the nave arcade. One cannot but think that such a decorative feature might have been used in a more suitable place, say in the plain surface of wall, sooner than in a position where solidity of appearance is most desirable. The nave roof is open-timbered, with trusses opposite each pier, seeming to be some 15 feet apart. But instead of the more usual treatment of an intermediate and less substantial truss, every sixth common rafter is trussed with braces, which has a good effect. In the aisles the purline set upright has its bearing reduced by curved struts. The trussed rafter arrangement consumes some extra amount of timber, but is always pleasing in perspective, and makes a very strong roof.

When any church of MR. WILLIAM WHITE'S is examined, one may be sure there will be evidence of independent thought and originality in it, though, happily, this architect never runs riot with his crotchets, but keeps within sober bounds. One may be also sure of solidity and good, sound, honest construction, and an absence of meretricious stuff. Bearing in mind these characteristics, let us briefly examine the *Church of St. Peter*, Clapham Junction. At the west end the rather unusual

plan of a semi-octagonal apse has been adopted, while the east end is square, having a triplet window, the central and highest one uncusped, the side ones cusped. Coloured bricks, in a quiet, sober manner, have been introduced externally with good effect, and the monotony of the gray stock brickwork thus well relieved. The weatherings of the buttresses are managed by a series of brick set-offs, half-chamfered, which, though a little dearer than the ordinary plan of having one continuous slope and cutting the bricks, is certainly more pleasing. There is a nave of very considerable width; and as there are only four bays, with one shorter bay, the building rather lacks length. The roof is strongly constructed—a judicious plan when the nave is not only of great span, but also of considerable height. There are massive tie-beams, their bearing being reduced by strong curved brackets. The collars occur at a rather high point, and then the roof is ceiled in wood. The arched braces springing above the beams are coupled together. There is no chancel arch, and the ridge runs continuously from end to end. The chancel roof has a hammer-beam instead of tie-beam construction, with figures of angels under, the span being less than that of the nave; the principals are also placed at a less distance apart. The clerestory is lofty, but, as almost inevitably happens, this has involved a diminution in the importance of the nave arcade. It is, of course, quite possible to have both these elements of architectural grandeur where expense is no object; but in many churches built nowadays one or other of the beautiful features alluded to must suffer. In the middle of towns, where buildings abut closely on the church, there can be no question but that the lofty clerestory is to be preferred to the lofty arcade. Some parts of the internal walls are plastered, the others lined with brick. This is a good plan, as a church with brick throughout is apt to look somewhat sombre; while if rough-stuccoed it looks poor and bare, longing to receive that decorative colour for which it has to wait—not months, not years, but too often till the Greek kalends arrive! But if a proportion of the internal surfaces is judiciously coloured, the building is warmed up and relieved, while the contrast with the plainer brickwork serves as a foil to still further lighten the decorative parts. The skeleton-framed bench ends are not secured together flush, as usual, but one piece slightly let into the other, which adds a little to their strength, but not to their ornamental look. It is to be regretted that in the passages tiles of so large a size as 6 inches square have been used, whereas the smaller size, 4½ inches square, would have better suited the building.

What a standing study is *St. Margaret's*, Westminster, to two very opposite factions. First, that numerous following who do not like anything which they think tends to obscure—they want to have everything open, so that you can see all of it at a glance. This party, it will be remembered, in the time of the late Canon CONWAY, were always clamouring (and the same cry has arisen since then from time to time, though not so loudly called out) to have his church swept away because it spoiled the appearance of the Abbey. Second, in later days, since Canon FARRAR was appointed, a Society has been formed who in the first days of their youth would have liked nothing done at all to *St. Margaret's*—would have loved to see it remain as in times past. They have grown a little more practical since, and realised the impossibility of carrying out in its entirety their original programme. Yet what has been done at the interesting church in question cannot be said to have fulfilled the aims and wishes of this ultra-conservative association. What a splendid riddance of dusty cobwebs which choked up and hid the beauties of proportion has been effected by the removal of the galleries, and by the partial restoration of the debased windows by the insertion of tracery of good Perpendicular character! A glance at the contrast between these two types of windows, side by side, in this church, ought to be sufficient to convince the most anti-restorationist as to which is best. The ceilings are entirely new, and come out effectively. The half-blank bay at the east end of the building is curious, and evidently has always been so, if one examines the clerestory, where the one-light window occurs in this place. The chancel was destroyed many years ago, and for obvious reasons could not now be restored. The chancel is, however, emphasised by a curved brace of greater depth occurring in the ceiling to mark the end of the nave, and a larger amount of ornamentation in the ceiling, as well as by the raised level of the pavement, &c. The curious old Dutch cinque-cento painted glass in the east window, the history of which is so well known, was so decayed that during the restoration Messrs.

CLAYTON & BELL were forced to enclose it in plate-glass, which somewhat impairs the full effect of the colouring, but was, of course, the only thing to do if it was to be preserved at all. The oak reredos, with its projecting carved canopy well terminated at the ends, and *The Supper with the Disciples at Emmaus* sculptured in the centre, is an effective feature, giving force and vigour to the composition, which would have been otherwise flat. The coloured decoration to the east wall helps to bring this end of the church into harmonious tone. Certainly before the recent alterations few persons, however experienced in such matters, would have realised what a good interior St. Margaret's possessed, thickly cumbered up as it was with incongruous modern work. We can now admire the well-moulded and good-proportioned graceful nave arcade, with the tracery in the spandrels and pretty range of clerestory windows, deeply splayed downwards. The antiquary and citizen cannot but be thankful that this structure has been preserved to the present day and its renovation so well carried out. Even in Stow's time there was a talk of pulling it down. In PETER CUNNINGHAM'S "Handbook of London" (1869) it is spoken of as threatened.

(To be continued.)

### A PHOTOGRAPHER'S RIGHT TO LIGHT.

THE Court of Appeal, as will be seen from the report we published last week, has granted a mandatory injunction restraining the First Avenue Hotel Company, Limited, from allowing their newly-erected building in Holborn to remain an obstruction to the access of light to the windows of a house adjoining, and occupied by a photographer, who was the plaintiff in the action. In other words, the defendants will be compelled to pull down the portion of the building obstructing the access of light to the plaintiff's windows. The case presents features which are unfortunately not of uncommon occurrence. There is the usual blunder about the angle of 45°, and the refusal of the Court of Appeal to accept any such criterion as a rule of law. There is the injury through loss and delay in the completion of the defendants' building, and, on the other hand, there is the injury caused to or anticipated by the plaintiff in his business of a photographer. These, we repeat, are not uncommon incidents to "light and air" cases; but it must be evident to all that serious injury to property and other attendant evils follow from the uncertain state of the law upon the question. In cases of this kind there is, of course, always an aggressor, and it is only fair that the individual whose rights of property are attacked should receive protection from the law. But, on the other hand, it is as manifestly inexpedient that great public improvements should be hindered, if not altogether prevented; that capital should be uselessly expended and labour unavailingly bestowed in consequence of the unreasonable protection afforded by law to private rights at the expense of the public advantage. The Legislature has not scrupled to interfere with, and even to confiscate, the rights of individuals where their exercise is clearly in conflict with the public good. We admit that such legislation should be scrupulously guarded in character, but some such legislation is evidently necessary with regard to ancient lights, if the repetition of cases so ruinous to private enterprise and public improvement as the one we are referring to is to be prevented.

It must not be assumed that we are dissenting from the views expressed by the learned judges of the Court of Appeal on the law, but we venture to question the expediency of their late decision none the less, and to express an opinion that the discretion vested in the Court might have been exercised with a greater advantage to public interests. Sir HUGH CAIRNS' Act was passed with the object of conferring on the courts of equity the power of awarding damages to the party injured, either in addition to or in substitution for an injunction. It was then recognised that the courts of equity required enlarged discretion to deal with that class of cases where the law gave great opportunities to persons so minded to harass their neighbours and extort money, under the guise of damages, for obstruction to light and air. The exercise of that discretion has been narrowed by the practice and decisions of the courts of equity to those instances where the circumstances of the case show that the injured party has

regarded the injury as capable of being compensated by damages. Vice-Chancellor MALINS, in the case of *BARKER v. LINDSAY*, expressed his views on this subject as follows:—

It is not likely you will induce me to order the Grosvenor Gallery to be pulled down. It is a mere question of money. One side says 300*l.*, the other 600*l.* By the terms of the order the defendant is bound to pull down if the Court shall direct. Considering the plaintiffs have got accommodation elsewhere, for me to order any portion of the Grosvenor Gallery to be pulled down I think would be hardly just, when I see that money would compensate. Whilst the owner of ancient lights is to have due protection, it must not be to such an extent as to render improvements impossible.

On the other hand, it is not to be assumed that the judges are unanimous in their opinions as to the principles upon which the exercise of their discretionary powers should proceed. It is much to be regretted that opinions widely differing from those last quoted, more narrow and less satisfactory from the public point of view, are to be found in the judgments of eminent judges. The late Vice-Chancellor WICKENS remarked, in the case of *DENT v. The Auction Mart Company*:—

It cannot be contended that those who are minded to erect a building, that will inflict an injury upon their neighbour, have a right to purchase him out without any Act of Parliament for that purpose having been obtained. It appears to me that it cannot safely be held that this Court will allow parties so to exercise their rights which they may have in their soil as to inflict an injury on their neighbour, if the neighbour is unwilling to take any compensation; or even though he be willing to take compensation, if he is not ready to submit to the valuation of a jury, but insists on his own right to determine what the value of his property is. It was said there had been negotiations, and Messrs. DENT were willing at one time to have taken 2,000*l.* for their right to oppose the erection of these buildings. After that it was said to be impossible to regard this as a case of irreparable injury, and that therefore the only ground on which a court of equity interferes in cases of trespass failed. If a man says he will take 2,000*l.* that affords some measure of the amount of the injury. The argument, therefore, would result in this, that because a man says he considers the inconvenience and annoyance is so great as not to be estimated by the amount of money damages which a jury would fix, but that he is willing, as some persons are, to sell his comfort and ease for a high pecuniary reward, therefore he is to be compelled to go to a jury who might award him some 100*l.* or 150*l.* His comfort is to be taken away, not at his own estimate, but at the value which a jury might put on it. That would be conceding to those who are desirous of erecting lofty buildings the existence of some unknown Act of Parliament, containing all the provisions of the Lands Clauses Acts. It appears to me that is a mistaken view of the jurisdiction of the Court.

On what principle will the courts proceed to exercise their discretion, and by what circumstances will that discretion be guided? The Court of Appeal in the case we are discussing disagreed with the application of the old practical rule in ordinary cases, that an unobstructed access of light should be allowed to the plaintiff's windows to the extent of an angle of 45°. There can be no doubt that where a right to light has been acquired by an uninterrupted user of nineteen years and a day, the courts take into consideration the purpose to which that light has been used in determining the question whether a building is an obstruction or otherwise. The angle of 45° might or might not allow sufficient access of light; it is a question of fact to be determined by evidence, and not by angles or hard-and-fast lines. The jeweller who requires a pure uninterrupted light for his business, or the person who requires a strong light for the examination of samples, or the case where a plaintiff's business was cleaning ostrich feathers and making artificial feathers, are examples of the varied character of such claims. The business of a photographer is one which, no doubt, requires uninterrupted access of light in an essential degree. The idea that the necessary access of light in all these instances can be determined by an angle of 45° is doubtless erroneous, as Lord Justice COTTON observed; and we must assume that, for the purpose of this case, the access of light to the plaintiff's windows was obstructed in a material degree by the defendants' buildings, even though they stood outside the angle of 45°. Nevertheless, we revert to the original question, Is this injury incapable of being compensated by damages? Are the plaintiff's premises incapable of being rebuilt or altered to suit the exigencies of the case, and thus enable him, if it is absolutely essential that he should do so, to continue to carry on his business in the house? The Court of Appeal have, however, directed the demolition of the obstructing portions of the First Avenue Hotel; and, unless wiser counsels prevail, this handsome building will share the fate which the Grosvenor Gallery narrowly escaped a few years ago.

## PARIS NOTES.

THE following awards have been made to French artists in the painting section of the Amsterdam International Exhibition: Gold medals to MM. Aublet, Agache, Butin, Carolus Duran, Cot, Duez, Lévy, Gervex, Maignan, Laugée, Luminais, Popelin, Belcourt, Roll, and Mme. Demont-Breton. Silver medals to MM. Béraud, J. L. Browne, Cazin, Decominck, Dantan, Goeneutte, Landelle, Lansyer, Maillard, Depenne, Protais, Rivey, Rixens, Thomas, Worms, Yon, Watelin, Leroux, Soyer, and Mdle. Henriette Browne. Diplomas of honour to MM. Morot, Pelouze, Rousseau, Hébert, Bastien-Lepage, Delaunay, and Bernier.

The municipal authorities are negotiating with the Government for the acquisition of such fragments, saved from the ruins of the Tuileries, as may possess interest from their connection with Parisian history. The Council has already voted several thousand francs for this purpose, and it is intended to place these fragments in the Cour d'Honneur of the Hôtel Carnavalet, by the side of the many other architectural specimens of great historic interest possessed by the city.

An important opinion has just been given by the conference of French barristers, to whom the question had been referred, as to whether the sale of a picture without reservation confers on the purchaser the right of reproduction. The lawyers have decided in the negative.

The preparations for the first exhibition of the Triennial Salon, to be opened on September 1 next, are being rapidly pushed forward. The Palais de l'Industrie has now been entirely cleared of the exhibits of the annual Salon, and handed over to the Departmental Committee that has been entrusted with the organisation of the new exhibition. It is intended so to arrange this Government Salon as to display to the very best advantage the comparatively few favoured works that will be selected by the jury; while in point of taste and the artistic splendour of accessories, it is not too much to say that the exhibition bids fair to surpass anything yet seen. The sculpture section, in particular, which will be installed on the ground floor as at the annual Salons, is to be hung throughout with the magnificent national tapestries belonging to the Garde-Meuble. The first floor galleries, exclusively reserved for paintings, will also be fitted up on an hitherto unknown scale of luxury, and, the number of works being strictly limited, each exhibit will have plenty of scope, so that no artist will be able to complain that his creations have been skied.

The managing committee of the Trocadéro Musée des Moulages has taken steps to acquire casts of Brézé's tomb in Rouen Cathedral and of some remarkable statues contained in the Basle Cathedral. Owing to the repairs now being carried out in the last-named edifice, these statues have been taken down from the niches, and their reproduction in plaster will thus be greatly facilitated. The committee has further decided upon a measure, the adoption of which may be looked upon as of international importance and benefit. This consists in the collection and publication of cheap photographs for the use of schools of design and other educational establishments of all the principal monuments, not only of France, but of all other countries.

The French school at Athens has received the necessary authorisation to continue its excavations at Delos during the present year, but will not recommence operations as long as the island is used as a lazaret for the reception of passengers from Egypt submitted to a quarantine of eleven days.

M. Ballu, jun., son of the architect of the Hôtel de Ville, is engaged in organising for the opening months of next year an Exposition des Dessins du Siècle, to be held at the Ecole des Beaux-Arts. The proceeds will be handed over to the Society of Artist-Painters, Sculptors, Architects, and Designers, founded some years ago by the Baron Taylor.

The group representing the Defence of Paris, to be inaugurated on the 5th of next month at the Rond Point of Courbevoie, will be erected on the granite pedestal upon which the statue of Napoleon I. formerly stood. It consists of a central female figure in military uniform, wearing a mural crown, and personifying the city of Paris; she is leaning on a broken gun-carriage, and, with her sword, protects a wounded soldier lying at her feet. A child, crouching amidst fascines, symbolises the sufferings of the inhabitants during that terrible winter. The President of the Republic, M. Ferry, the Premier, and General Thibaudin, Minister of War, have been specially invited to attend at the unveiling of

this memorial, for which also the greater part of the Paris garrison will be paraded.

It appears that the question of utilising the ruins of the Palais de la Cour des Comptes, burnt under the Commune, is entering upon a new phase, and will probably be resolved in a very utilitarian sense. None of the projects elaborated either by the Government architects or by the City Works Department having been found practicable, owing to the enormous expense of rebuilding the ruins on the lines of the original edifice, it is now proposed to hand over the building to private industry. A number of architects visited the spot last week, and unanimously agreed that the arrangement of the ruins utterly precluded their adaptation to any trade or manufacture whatever, and that it would be preferable altogether to remove the upper part of the ruins, leaving only the cellars and basement as foundations. These have resisted both the fire and the onslaughts of time and weather, the cellars, in particular, being so solidly built that even when the Seine is at its highest no water has ever been able to find its way into them.

## THE NORTHUMBERLAND AVENUE HOTEL.

THE foundation-stone of the Northumberland Avenue Hotel was laid, on the 19th inst., by Colonel C. S. Dowson, the chairman of the company. The site is over 350 feet in length, and lies between the offices of the Christian Knowledge Society and Charing Cross, thus occupying nearly the whole of one side of the avenue. The entrance to the hotel will be in the centre of the façade, and will lead direct to the inner hall and grand staircase. Right and left of this entrance will be found offices for the manager, the staff connected with his department, telegraph office, &c. At the end nearest to Charing Cross will be provided a restaurant and buffet, grill room, and smoking room, all self-contained, and forming a feature of the hotel, of which the public can avail themselves without residing in the building. It is understood that the Electric Railway Company, which is to convey passengers from Waterloo to Charing Cross, were negotiating with the directors of the Northumberland Avenue Hotel for a portion of the site at the northern end for the purpose of a station, so that passengers arriving from the south and south-west of England could, on alighting from the railway, pass into the hotel without going into the open air.

The other features of the ground-floor will be the *salle-à-manger* 100 feet long by 42 feet wide and 30 feet high, with wings at each side, giving an extra width of 26 feet. Architecturally, this is intended to be one of the most imposing dining-halls to be found in the metropolis, and the comfort of those using it will be considered in all the details of lighting, warming, and ventilation. The other notable rooms on the ground-floor will be the coffee-room, the ladies' drawing-room, general reception-room, billiard-rooms, and smoking-room. Indeed, all the reception-rooms will be found on this floor, the directors having resolved not to devote any of the ground-floor area to purposes unconnected with the hotel.

The grand staircase will be 44 feet wide, and will consist of a central flight and two returns. The walls enclosing it will be lined with marble, and there will also be a marble colonnade and balustrade round the dome, through which light will be admitted to the staircase. Visitors to the hotel will have the option of using it or availing themselves of the lifts, which will be provided at convenient stations in the corridors. Suites of rooms suitable for families will be provided on the first and second floors, and it should be noted that a great many of these rooms will have bay windows commanding excellent views both of the river and Trafalgar Square. Suites of rooms will be provided for private dinners and for masonic parties. The whole of the floors will be of fireproof construction, with iron balconies and staircases at the back communicating with the corridors on each floor, thus affording a ready means of escape in the event of fire. There will be four floors exclusively devoted to bedrooms, and on the top, or seventh floor above the ground storey, will be found the kitchen and the culinary department. The total number of rooms, exclusive of the public reception and private rooms will be upwards of five hundred. The front façade will be entirely constructed of Portland stone and polished granite. The elevation will be upwards of 100 feet in height. It is designed in the Renaissance style, and will be surmounted by Mansard roofs.

The works are contemplated to occupy some eighteen months, and it is thought the hotel may be finished and ready for occupation for the season of 1885. The estimated cost of the building is 200,000*l.*, to which must be added a further sum of 70,000*l.* for decorations and furniture. The works in building are entrusted to Messrs. Perry & Co., of Tredegar Works, Bow; the decoration and furniture will be confided to Messrs. Gillow & Co., of Oxford Street; the architects being Messrs. Isaacs & Florence, of 3 Verulam Buildings, Gray's Inn. Mr. A. Wheatley is general foreman, and Mr. Charles Tell, the clerk of works.

## NOTES AND COMMENTS.

THE result of the second competition for the proposed Municipal Buildings in Nottingham suggests the difficulty of deciding when there are a few selected competitors. In the first stage there were 117 plans submitted, and from them eight were selected, five being by provincial and three by London architects. The authors were MESSRS. TRUMAN & PRATT, of Nottingham; Mr. YEOWILLE THOMASON, of Birmingham; Mr. CORSON, of Leeds; Mr. HICKSON and Mr. OLDHAM, of Manchester; Mr. CHARLES BELL, Mr. WILLIAM HARVEY, and MESSRS. VERITY & HUNT, of London. Mr. HARVEY was, we believe, unable through illness to take part in the second competition, and consequently there were seven competitors. They adopted new mottoes. Mr. WATERHOUSE undertook the office of judge. He reports that the two designs "Wisdom, Strength, and Light" and "Queen Bess" are of equal merit; but there is a difference in the estimated cost. The first is put down at 128,416*l.*, and the second at 118,500*l.* The provinces as well as London have a share in the victory. Mr. WATERHOUSE considers "Sepia" to be next in merit. It is the most expensive design, for the author's estimate is 157,883*l.* The remaining designs are signed "Esperance," "Strive to Thrive," "Speedwell," and "Fiat." The corporation have to decide whether one of the designs will be accepted.

THE O'CONNELL monument, in Sackville Street, Dublin, which has been in hand for several years, is now complete, and the accounts for the work have been settled. The commission for the memorial was given to the late JOHN HENRY FOLEY, R.A., and after that sculptor's death, it was entrusted to his friend, Mr. BROCK, A.R.A. Mr. ARMSTEAD, R.A., has testified that "Mr. BROCK has modelled and carried out the design of the late Mr. FOLEY with remarkable vigour and ability, and with the utmost care as to sound and good bronze castings, and well executed masonry." The sum paid to Mr. BROCK has been 10,500*l.*, and a large sum was advanced from time to time to Mr. FOLEY. The plaster models are in the foundry at Thames Ditton, and may be obtained by any Irish municipality or institution on application. The memorial is generally considered a success in Dublin, but from some points of view the pedestal is supposed to be too large for the figure.

SCIENCE has been said to be the knowledge of many persons made systematic, so that it may be acquired by one person. Is it, then, possible to give such a scientific form to the valuing of land and houses? At the present time that question would be answered in a different way by the House of Lords and by the Commissioners who are fixing the rents of tenants in Ireland. A committee of the Lords, after investigation, consider that the valuers and other officials employed by the Irish Court should have received instructions, or, in other words, that there should be a standard, and normal values fixed beforehand; and their Lordships adopt the statement of Professor BALDWIN, one of the sub-Commissioners, that it was "a frightful thing to let them loose on the property of landlords and tenants without instructions." The Commissioners, on the contrary, say it is impossible to communicate to others, in the form of principles, that kind of knowledge which is only to be acquired by personal experience and skill. A quasi-scientific form was devised by the late Sir RICHARD GRIFFITH when he organised the Government valuation system in Ireland, and the Lords may desire to have something of the kind for the Land Act valuers. But it is absurd to suppose that there can be a system by which difference of opinion is an impossibility. If their Lordships would glance over the evidence of the surveyors on any railway property case in London, they would find that the ablest men in the profession frequently differ about the value of a house or a set of chambers.

THE fruitless competition for the Dublin Museum has cost the country 1,555*l.* 15*s.* 1*d.* The five architects who took part in the second competition have received 1,450*l.*, and the remainder was spent on expenses connected with the exhibition of the designs in the Shelbourne Hall. Nails must be costly in Ireland when it requires 105*l.* to hang a few drawings. It has been generally supposed that the failure of the competition was due to the circumstance that the five

architects happened to be Englishmen, but the official explanation could not well recognise the facts. Another reason is therefore given for the Government concession to insular prejudices, namely, that "a strong desire was expressed by the representatives of the various departments that a change should be made in the contemplated arrangement." The representatives were engaged for several years considering the details of the proposed museum, and it is strange to find them suddenly desiring a change in their own arrangements as soon as they saw the five plans.

THE fortieth annual congress of the British Archaeological Association is fixed to be held at Dover, under the presidency of Earl GRANVILLE. An opening meeting will be held at the Town Hall on Monday, August 20, when Lord GRANVILLE and the members of the Association will be formally received by the Mayor and Corporation, who will entertain them at a public dinner the same evening. Tuesday will be spent in a visit to Deal, Sandwich, Richborough Castle, and Walmer Castle; Wednesday in visits to Westenhanger, Fair Rosamond's Bower, Lynne Castle and Church, Saltwood Castle, Hythe, and Caesar's Camp between Dover and Folkestone. Thursday and Friday will be devoted to Canterbury, when the cathedral and several of the most interesting churches will be visited, together with St. Augustine's Abbey, and whence excursions will be made to Bekebourne, Patrick'sbourne, and Barfreston. On Saturday the members of the Association will visit the Templars' Church on the western heights of Dover, and they will be subsequently conducted over Dover Castle. In the evenings, papers on subjects connected with the congress will be read at the Town Hall. The first three days of the following week will be regarded as "extra days," and will be devoted to visits to the ancient town of Calais.

"SEPARATE ESTATES" occasionally cause trouble in building accounts. Some time ago a builder in Hadlow carried out work for a lady, and his bill amounted to over 200*l.* But his solicitor was informed that the claim was chargeable to the lady's separate estate, which was inadequate to meet the amount. It was discovered that, in addition to about 1,000*l.* a year, there was also a sum of 5,000*l.* in the 3 per Cents, which was available, although this was denied. In spite of the efforts of counsel, who said the claim was only a "do," the jury found for the builder, and they expressed a regret that they could not also add interest.

AN inscription which is on one of the bronze figures of crabs that originally supported the Egyptian obelisk in the Central Park of New York, has been deciphered by Professor MERRIAM, of Columbia College. According to it, the obelisk was erected by the architect PONTIUS, under the direction and auspices of PUBLIUS RUBRIUS BARBARUS, probably in the year B.C. 13-12. PONTIUS was an Athenian by birth, and having transported two of the obelisks of Heliopolis to Alexandria for BARBARUS, the first experiment of the kind under the Romans, he is conjectured to have been afterwards engaged to transport two others to the Capitol. There is also some reason to think that he was a friend of MECÆNAS.

THE Commissioners of Public Works in Ireland have advanced a good deal of money during last year for building. There were twenty-eight applications under the Labouring Classes' Lodging-Houses and Dwellings Acts, amounting to 47,821*l.*, for the erection of dwellings for 470 families; loans for the accommodation of 270 families, and amounting to 21,187*l.*, have been granted. Of those not sanctioned some few have been rejected, the title of the applicants not coming within the requirements of the Act under which such loans are made, some in consequence of the class of buildings proposed not being suitable for dwellings for the labouring classes, whilst the remainder are under consideration. The advances during the year have amounted to 10,908*l.*, and the total amount advanced under these Acts has been 118,421*l.* For the erection of glebe houses 18,441*l.* were granted. Since 1870 the grants under this Act have amounted to 324,960*l.*, and it is remarkable that one-half of the loans were to Roman Catholic clergy. The sum of 6,803*l.* has been granted for the erection of residences for the National School teachers, and 4,780*l.* for dispensary houses.

# The FOUNDERS' TOMB

ST. BARTHOLOMEW THE GREAT

SMITHFIELD.

Sprague & Co. 22, Nassau Lane. Cannon St. EC

SUGGESTED ALTERATION OF SEGMENTAL ARCHES, ST. PAULS CATHEDRAL.  
By ROGER T. CONDER.

## ILLUSTRATIONS.

RUSSELL CHAMBERS, BURY STREET, OXFORD STREET.

THESE buildings are in course of erection at the corner of Bury Street, Oxford Street, for Messrs. SANDON BROS., from the designs and under the superintendence of Mr. W. SECKHAM WITHERINGTON, F.R.I.B.A., 79 Mark Lane, E.C. The floors and roof have been constructed on their fireproof system by Messrs. DENNETT & INGLE.

FIREPLACES, IVY DALE, NORTHAMPTON.

IVY DALE was erected last year for Mr. W. COULSON, mayor of Northampton, the architect being Mr. S. J. NEWMAN, A.R.I.B.A. The library fireplace is executed in American walnut-wood. The jambs and frieze are slightly different from the design shown, and were executed in WILCOCKS' faience of a light apple-green colour, glazed; and the hearth is of tiles to match.

The bedroom fireplace shown is executed in pitch pine. At the back the three panels are filled with bevelled mirrors. The jambs and frieze round the grate are of green serpentine. The woodwork of these chimneypieces, as also all the other fittings in the house, was well done by the contractor for the erection of the house, Mr. G. HEAP.

SUGGESTED ALTERATION OF SEGMENTAL ARCHES OF ST. PAUL'S CATHEDRAL.

DOORWAY, RIEVAULX ABBEY.

THE FOUNDER'S TOMB, ST. BARTHOLOMEW THE GREAT, SMITHFIELD.

THIS beautiful example of Perpendicular work is situated in the north-east corner of the Priory Church of St. Bartholomew, the choir of which, forming the present church, alone remains.

The tomb is supposed to have been erected about the fourteenth century, to the memory of RAHERE, the founder of the priory, who, having seen a vision of St. BARTHOLOMEW commanding him to build a priory, selected a waste and marshy piece of ground in Smithfield, thus exemplifying Isaiah li. 3, a Latin version of which is inscribed on the books borne by the two small figures on the tomb.

The following account of the founding of the priory, taken from "Stow's Annales of England," may not be uninteresting: "This yeere (1102) the Priorie and hospital of S. BARTHOLOMEW in Smithfield was begun to be founded by RAHERE (a man of a singular and pleasant wit, and therefore of many called the king's jester and minstrel), in a place which before had been a marish ground, a common laistaw of al ordure and filth, and the place where felons and other transgressors were executed. This RAHERE joyned unto him a certain old man named ALFUNE, that had (not long before) builded the parish Church of S. Giles nigh a gate of the citie of London, then called Creeplegate: this man he used as a Counciller and companion in his building of the Church and Hospital, and the one of them, to wit, RAHERE, became the first Prior of that priorie, and the other, to wit, ALFUNE, became hospitaller or proctor for the poore and went himselfe dayly to the Shambles, and other Markets, where he begged the charitie of devout people for their reliefe, promising to the liberall givers (allading testimonies of holy Scripture) reward at the hands of God."

## SOCIAL SCIENCE ASSOCIATION.

THE annual business meeting of this Association was held on Tuesday, the retiring president, Mr. Hastings, M.P., in the chair. A report from the Council detailing the action taken by the Association during the twelve months ending June, was presented and ordered to be received and circulated.

The following appointments in the Association for the ensuing year, 1883-84, were then made: President, Sir Richard Temple, Bart, G.C.S.I., C.I.E., D.C.L., LL.D., late Governor of Bombay; Presidents of Departments: I. *Jurisprudence*: Mr. Wm. Barber, Q.C., Professor of Law of Real and Personal Property at the Inns of Court; II. *Education*: Mr. Francis Sharp Powell, M.A.; III. *Health*: Mr. T. Pridgin Teale, M.A., F.R.C.S.; IV. *Economy and Trade*: Mr. J. E. Thorold Rogers, M.A., M.P.; *Chair-*

*man of Repression of Crime Section*: Mr. C. H. Howard Vincent, Director of Criminal Investigations. Mr. Hastings, M.P., was elected a permanent vice-president of the Association; and, retiring from the presidency of the Council—a position which he had held since the death of the late Lord Brougham, in 1868—the appointment of his successor was left in the hands of the Council. Mr. Westlake, Q.C., LL.D., and Mr. Joseph Brown, Q.C., were re-appointed as Foreign Secretary and Treasurer; and Mr. Andrew Dunn and Mr. Andrew Edgar, LL.D., were the re-elected Auditors. The following were appointed Hon. Secretaries of Departments: I. *Jurisprudence*: Mr. H. N. Mozley, M.A., and Mr. Meryon White, M.A.; *Repression of Crime Section*: Mr. Herbert A. Safford; II. *Education*: Mr. Rowland Hamilton; III. *Health*: Mr. H. H. Collins and Dr. Seaton; IV. *Economy and Trade*: Rev. S. A. Steinthal, and Mr. Edward J. Watherston; V. *Art*: Mr. Philip H. Rathbone and Mr. Arthur H. Mackmurdo.

The proceedings terminated with the election of the various Standing Committees of Departments and hearty votes of thanks to the officers for their services during the past year.

The Congress, this autumn, is to be held at Huddersfield, from October 3 to October 10.

## DONATELLO AT THE SANTO AT PADUA.

IN the history of Italian art, says a correspondent of the *Times*, which for centuries was a sequence of triumphs and advancement, there stand out periods of more than ordinary activity, when the advance seems rather to have been made in leaps and bounds. These brilliant epochs were naturally the result of the advent of some artist of more than ordinary genius, and are often associated with some particular spot, usually a church. From thence art received a fresh impulse, the old forms that were perhaps commencing to crystallise were cast aside, and as long as Italian art retained its vitality the process was continually in action, not the least remarkable fact being the duration of this recuperation. Such points of departure are the Arena Chapel at Padua, the Brancacci Chapel in the Carmine at Florence, and others in various parts of Italy; but in the series there is perhaps none bearing higher interest, both for its intrinsic character and extended influence, than the high altar of the Santo at Padua, or rather, it should be stated, what was the high altar, for of the bronzes which decorated it only a part remain as Donatello left them, the rest being now scattered about the church. The occasion of the acceptance of the commission by Donatello arose from his being at Padua to execute the statue of Gattamelata. At the death of that celebrated *condottiere* the Venetian Senate decreed that a public monument should be erected in his honour, and Donatello, as the foremost sculptor of the time, was engaged for the work. An equestrian statue of such importance necessitated for the artist a lengthened residence on the spot—he seems to have stayed at Padua from 1474 to 1483—and being there the citizens would naturally be desirous of securing some of his work for the adornment of their principal church. The statue itself, which stands in the piazza in front of the church, was a striking success. It remains now second to none of its kind, either antique or modern. In contemplating it, the *Marcus Aurelius* of the Capitol and the *Colleoni* of Donatello's celebrated pupil arise in the mind, but the sense of command and authority in the general, the life-like presentation of the horse, the perfect unity of action of the two, the bold, clear lines of the composition, its severe restraint, and the consummate execution of every part, may claim for it the palm, even when brought into comparison with its two celebrated rivals.

The high altar of the church gave Donatello the widest scope for the display of qualities that he judged right to keep in abeyance in the statue. In this his aim seems to have been to accentuate the feeling of latent power. Beneath the simple gesture of authority we are made sensible of the possession of a force that might burst forth into fiery action. No such need of restraint was necessary in the bas-reliefs and statues of the altar. There the emotions might have free play, and there Donatello, the great master of dramatic expression, gave full course to his inexhaustible imagination. The decoration of the high altar was originally composed of four large bas-reliefs, representing the miracles of St. Antonio; twelve panels of angels singing and playing musical instruments, two bas-reliefs of the Man of Sorrows, with a life-size crucifix and statues of St. Antonio and other saints, also in the round, the whole being in bronze. Now the crucifix and the statues are placed at a great height in the church, they may also be said to be out of reach of observation, and two of the large bas-reliefs, with a dead Christ and a couple of the panels of angels are inserted in the altar of the Chapel of the Sacrament; the symbols of the evangelists, executed, probably, by Donatello's pupils, are in the choir. The portion remaining in its original state in the front of the high altar, has in the centre a Man of Sorrows, and on either side compositions of the Miracles, with panels of angels at the angles. In no respect has Donatello shown greater skill than in the treatment

of the Miracles, which all, saving one, are as subjects puerile to the last degree. There can be little question of the feelings which arise in the mind at the narration of legends like that of the hungry ass who went on his knees when St. Antonio presented the Host before him; of the new-born infant finding speech to testify to the innocence of his mother, falsely accused of infidelity; or of the saint making whole the leg of the young man who broke it in kicking his mother. The last of the four—an illustration of the text, "Where your treasure is there will your heart be also"—is in itself a really fine subject, and in Donatello's hands it receives worthy presentation. In the centre of a Florentine palatial interior stands a bier with the dead body of the rich miser stretched upon it; the saint gives orders that the breast be cut open; this is being done by the surgeons, and the cavity is discovered to be empty. Crowds press round, regarding the operation with eager curiosity and horror. The persons nearest the saint fall on their knees, one kisses the ground where he has trodden. Naked children run in terror to their mothers, who fold them in their arms. On the left a group is seen round an iron-bound money chest, which they have forced open, and there, bedded in his treasure, is found the heart of the miser. The figures in this and the other larger compositions are about eight or nine inches high. Beside the miracle of the miser on the high altar is that of the unfilial-mannered youth. The ruffian is rolling in agony on the ground, people hold his hand, and otherwise betray an interest and commiseration for his condition which he would scarcely receive in northern lands. The saint kneels down and clasps the offending member in both hands. Here, too, groups of figures in eager converse surround the principal actors. The background represents a quadrangle, with seats rising from a raised platform. Between these compositions is a Man of Sorrows, a dead Christ seated on a throne, with angels around Him. It bears a strong resemblance to the central figure of a similar subject which was exhibited at Burlington House two years ago, and then attributed to Mantegna. The three panels with two smaller ones of singing angels are let into the warm white marble, having a plinth of red Verona marble and a moulding of the same at the top; great bosses of bronze stud the surface at the corners of the plaques. In the backgrounds of the composition there is a considerable amount of gilding of the thick antique sort, that looks like gold plates. Here and there the dark bronze figures relieve off this dulled gleaming surface; or again, as in the backgrounds of the angels, there are passages of the most minute and exquisite diapering, fine and delicate as *niello* work. So that, seen from a sufficient distance for the eye to take in the whole effect, and regarded only as colour and the decorative disposition of masses of light and dark, this altar front displays a depth of imaginative conception second only to the purely sculptural qualities of the compositions themselves.

The subjects on the altar of the Sacrament are the testimony of the ass and of the new-born infant. The former takes place in a church which has three grand arches of early Renaissance architecture. The saint stands on the altar steps and presents the Host to the ass, who kneels before it. Some of the heretics in the church are already convinced, others still question and doubt. The latter subject has St. Antonio in the centre, who takes the babe in his hands. A crowd of women on the right fiercely denounce the supposed culprit. One fierce virago, with naked breasts, extends her arm. Two hags have thoroughly made up their minds on the matter. Some of the women scrutinize the countenance of the saint; all are violently excited. We seem to hear their shrill, sharp, accusing voices. It will be noted that by a satirical touch the artist has made the accusers of the same sex as the accused. She herself kneels with folded arms at the feet of the saint. On the right stands a group of men and youths in short jackets, tight hose, and Florentine *birette*, with daggers at their girdle. These evidently rejoice at the fortunate termination of the case. A graceful figure of a peasant girl smiles as she turns away on her errand. Throughout the compositions the eye is arrested by these single figures, grave or graceful, that stand out from the surging, swaying, or kneeling crowds, serving as special points of attraction, while perfectly harmonising with the general action. Between the last two miracles is placed a dead Christ between lamenting angels; they are of the same type as those in the smaller panels, and serve as a fine contrast to their fellows, who accompany their songs of praise with lute, or pipe, or cymbals. The head and torso of the Christ is, both for sentiment and execution, in Donatello's finest manner; the gradation and sense of actuality rendered in such low relief being a triumph of modelling. Those acquainted with the Berlin Museum will at once recognise the source from which Giovanni Bellini has taken the motive of his dead Christ.

In a different material to the above-mentioned works, and perhaps even displaying greater force of imagination, is the bas-relief in terra-cotta of the Entombment. The dead Christ is being reverently laid in the sepulchre, while Mary and the disciples are overwhelmed with grief and despair. Their sorrow finds vent in cries of anguish and gestures of despair which rend the heart. Donatello here strikes one of his profoundest chords of tragic expression; indeed, it may be asserted that in few examples of plastic art are the emotions more deeply stirred than in these few

square feet of burnt clay. In tracing the development of artistic motives remarkable affinities are sometimes observed, and it can scarcely have been pure hazard that determined a certain likeness of composition and sentiment between this panel and Sir Richard Wallace's superb drawing of the death of Gattamelata by Polaiuolo. The forms of the latter master had not Donatello's breadth and movement, nor was his inspiration on as high a level, yet it was of the same order, and it is impossible to resist the notion that the masterpiece of Hertford House owes its origin to the terra-cotta of the Santo.

## THE SCIENCE AND ART DEPARTMENT PRIZES.

THE Lords of the Committee of Council on Education have by a recent minute decided to withdraw the prizes hitherto given to candidates in the science examinations who obtain a first-class in the elementary stage of the various subjects of science, substituting certificates of merit, and retaining only the prizes given in the advanced stage. The money hitherto devoted to prizes will be employed in providing for thirty-six national scholarships—twelve each year—which will be offered in competition to students of the industrial classes, and awarded at the annual examinations of the department. The national scholarship will be tenable, at the option of the holder, either at the Normal School of Science, South Kensington, or at the Royal College of Science, Dublin, during the course for the Associateship, about three years. The scholar will receive 30s. a week during the session of about nine months in the year, second-class railway fare to and from London or Dublin, and free admission to the lectures and laboratories. It is understood that a corresponding alteration will be made in respect of the prizes in art schools.

## IRISH ECCLESIASTICAL ANTIQUITIES.

DURING the past year the Commissioners of Public Works in Ireland have carried out works under the direction of Mr. T. N. Deane, R.H.A., on the following "National Monuments," viz., Rosserk Abbey, Co. Mayo; Quin Abbey, Co. Clare; Creevelee Abbey, Co. Leitrim; Killala Round Tower, Co. Mayo; Banagher Church, Co. Londonderry; Inchcleraun Churches, Abbey, &c.; Athassel Abbey, Co. Tipperary. The cost of the works has been about 4,000*l*. In his reports Mr. Deane gives some interesting information respecting the buildings.

The interesting abbey of Rosserk, situated upon the Moy, near Ballina, was, he says, in a most ruinous condition; the walls in many places were on the verge of falling, the tracery of the eastern window had disappeared, but a careful examination of the *débris* produced all the missing stones. These were reset in their original position, thus reproducing an excellent example of fourteenth-century tracery. The tower, a bold piece of construction, is about 15 feet square by 60 feet high, is carried on two arches, which divide the nave from the choir; the soffit is carefully groined. In the tower is an apartment which is entered from a door considerably above the level of the roof of choir; this apartment may have been used as a cell or "domus inclusi."

The plan of the abbey consists of nave, 45 feet by 18 feet; chancel, 33 feet by 18 feet; south transept, 32 feet by 20 feet. On the north are conventual buildings, two storeys in height. To the south of the high altar is a double piscina, the spandrels of the arches are carved with figure sculpture, and the recess groined. In the southern transept there is a curious confessional.

The walls of the buildings have been secured and pointed, the arches over conventual buildings have been coated with cement concrete, the tower has been pointed and missing stones supplied, the tracery of windows replaced and secured, and bars have been put in some of the opes to prevent trespass; gates also have been put to western doorway.

The works at Quin Abbey are now finished. They were of an extensive nature, and consisted of pointing, rebuilding dangerous portions of walls and arches, cement coating on vaultings, clearing out cloisters, readjusting tombs.

Some repairs have been done to the ancient church adjacent to the abbey, which dates from the thirteenth century. At the eastern end are three lancet windows; the buttresses have fine mouldings. The walls have been partially pointed, the tops groined, and the buttresses underpinned.

Creevelee Abbey was founded for the Franciscan Order, A.D. 1508, by Margaret O'Brien, daughter of Lord O'Brien, and wife of Eugene Lord O'Rourke. In the village of Dromahaire is the manor-house of the O'Rourks, a good example of Tudor architecture. The abbey in many respects resembles that at Sligo; it consists of nave, south transept, tower and choir, refectory, and other conventual buildings. A descendant of the founder of this abbey, and probably the builder of the manor-house, was an active rebel in 1588. He submitted, and went to London to be introduced to Elizabeth, but, refusing to bend his knee to the queen,

and declining life or pardon, simply requested to be "hung by a withe, according to the custom of his country"—a request, as the chronicle states, readily granted.

The following are the general dimensions of the abbey: Nave, 60 feet by 19 feet; choir, 40 feet by 19 feet; transept, 40 feet by 19 feet; and cloister garth, 45 feet by 55 feet. The conventual apartments contain refectory and library. The character of the architecture corresponds throughout with the date ascribed to the foundation.

The cloister garth has been excavated, and nearly the entire of the arcade arches have been found. These correspond in detail with those at Sligo Abbey. Large gaps in the wall have been rebuilt; the tracery of the windows has been secured; missing portions, when found, have been replaced. The entire tracery of the western window was found and reset. Tombs have been levelled, and it is hoped that steps may be taken to prevent the desecration of the abbey by the overcrowding of graves, which at present is carried on to an extent injurious to health and disrespectful to the church.

Athassel Abbey is probably one of the most interesting abbeys in Ireland, of great extent, and truly worthy of being classed as a national monument. It was founded by William Fitz Adelen de Burgho, for canons regular of the Order of St. Augustine. The De Burghos, it is recorded, were great benefactors to this abbey, and it was a considerable structure in 1202. Mr. Deane, however, is disposed to fix the date of the main building at 1260. The dimensions of the church are very large in comparison with others in Ireland, viz.: Nave, 121 feet by 57 feet 10 inches; choir, 79 feet by 27 feet 6 inches; transept, 30 feet 8 inches by 28 feet; and cloisters, 85 feet by 89.

The main church, with its transepts and choir, is thirteenth-century work of a good type. To the north of the western entrance are the remains of a large tower. Towers are very rare on Irish churches at so early a date, and the position of this one is very peculiar. To the south of the entrance is a small chapel carefully groined from vaulting shafts. Little remains of the pillars of the nave, but it must have been divided into six bays; the space between the vaulting shafts being 21 feet, from the remnants of these shafts which have been found. The choir was separated from the nave by a wall from top to bottom, with a beautiful central doorway, an illustration of which is given; at either side were niches for statues. Above the central entrance was an open archway, which probably corresponded with the rood screen.

On entering the choir, to the right and left are the transept arches, 27 feet span by 46 feet to the apex of the arch; the mouldings of the piers are simple and bold. The choir arch was 21 feet 3 inches span. In 1329 Brian O'Brian burnt Athassel to the ground. At that time it is probable the transept arches and choir were seriously injured. This portion of the abbey was utilised for domestic purposes of a semi-military character. Walls were built within the space enclosed by the transept arches, this space being vaulted in a single span; the transept arches were raised upon, and the upper portion was used as a dwelling. The approach to these apartments was a passage along the top of the transept wall, entered by a circular staircase in the south-east angle of transept.

The choir of the church is lighted by the side windows and eastern window of three lights, the latter fifteenth century tracing; the parapet was stepped. The extent can be traced of the first church, which consisted of nave, north-west tower, south side chapel, choir and transepts, with conventual buildings in continuation of south transept. The total length of the conventual buildings was 87 feet 10 inches. The cloister was enclosed by walls, and entered at the south-west corner. Mr. Deane doubts that the early cloister garth was arcaded. The present arcade is fifteenth-century work.

The various changes which were made in the early part of the fifteenth century makes it difficult to define with accuracy many points of interest in the original thirteenth-century building. Amongst them may be noted the fact that the bases of the transept arches are at a level of several feet above the church floor. The south transept has no evidence of having had a sub-storey, but it may have been made at a later period. The elevation of the bases tends to support the idea that both transepts had sub-chapels originally. Mr. Deane hopes to be able to satisfy himself on this point during the works at present in hand. The remainder of the conventual buildings in connection with the abbey church are all of fifteenth-century date, and do not present any particular features of interest. The choir contains many interesting effigies and monumental stones, one of the former probably Walter, Earl of Ulster. The memorial-stone with two figures is peculiar.

Beyond the abbey church and its immediate surroundings, and separated by intervening land, there is a strong wall and out-buildings. The abbey lands originally formed an island in the Suir, which was approached by a bridge of three arches leading to the gate-house, which was vaulted, and strongly defended by lifting gate or portcullis.

Banagher Church, formerly called Beaunchar, or The Horns, is a curious and early structure. It consists of nave and chancel, the former 35 feet by 20 feet, the latter 20 feet by 11 feet. The western doorway is square-headed, with inclined sides. The

founder of the church, St. Muirdach O'Heney, who lived A.D. 1121. In the graveyard surrounding the church are many inscribed slabs of early date, and others of the sixteenth century, bearing the names of old families in the county, amongst these many of the O'Heney's. The tomb of the founder, which is an oblong structure 12 feet by 6 feet, with gabled stone roof and effigy of the saint, has been repaired lately, and is in good condition.

The ruins of Inchcleraun Churches and Abbey are of very early date, particularly the church with the square tower at western end, referred to in Petrie as one of the earliest examples of such a structure. The stones are massive and wrought square. The founder of this church is stated to have been St. Dhiarmuid Naomih, or The Just, A.D. 540. The buildings on the island appear to have been frequently pillaged up to A.D. 1193. At the southern end of the island are the remains of two Romanesque churches, and portions of a conventual building of later date. The works consisted of pointing, repairing broken walls, concreting arches, and generally placing the ruins in a safe condition.

## THE ELECTRIC LIGHTING ACT.

A PARLIAMENTARY paper has been issued containing the report of the Board of Trade respecting the applications to and proceedings of the Board under the Electric Lighting Act of 1882. From this statement it appears that by December 21 last, the date prescribed by the rules which the Board of Trade had issued, 106 applications had been received. Twenty-three of these were promoted by local authorities, and 83 by companies; 97 of the applications related to places in England and Wales, eight to places in Scotland, and one to Belfast, Ireland; 35 related to London and the suburbs. A list of the applications is given in an appendix. A fee of 50*l.* was received with each application, and in ten cases where separate orders have been granted for various districts included in one application an additional fee of 10*l.* has been charged by the Board of Trade. The total amount of fees received amounts to 5,400*l.* The time for lodging objections was limited by the rules to two months from the date of the first advertisement of the application. It was, however, extended by a new rule to February 1. Eventually, after a consideration of the orders as deposited, and of the objections which had been lodged against them, the Board of Trade determined upon the principles upon which the applications should be dealt with, and on February 28 they circulated model clauses for adoption with such modifications as might appear to be necessary. The charges to the public are more than covered by the fees received.

## THE AMENDED PATENT BILL.

THE Patents for Inventions Bill, as amended by the Standing Committee, has been reprinted, ready for presentation to the House. In its new form the part of it relating to patents for inventions shows many important alterations, though in details only, the amendments having scarcely touched any of the main principles of the original measure. The improvements which have been made are for the most part due to the efforts of committees of the Society of Arts, the British Association, and the Institute of Patent Agents, all of which bodies had interviews with Mr. Chamberlain, and were also represented in the Grand Committee by Sir John Lubbock and other members. Mr. Samuelson, Mr. Hindes-Palmer, and Mr. Anderson also were active in introducing amendments.

As regards the method of application for patents no great changes have been effected in the original scheme. Provision is made for joint application by several persons, of whom one or more may be the actual inventor, and the rule that the provisional specification was to contain precise claims has been struck out. The proposed system of examination into applications has been modified in several particulars. The examiners are not to inquire into "subject matter"—that is to say, to report whether the invention is a proper subject for a patent; they are only to see that the proper forms are complied with, and that a proper description of the invention is supplied (strangely enough, the examination into this point is still limited to the provisional instead of being extended to the complete specification). They are, however, to report if they find two applications for protection for the same invention, and in such a case both applicants are to be informed. Provision is made for the keeping secret of the examiner's reports, even in the case of an action at law.

The provisions for opposition to grants of patents are the same as in the original Bill, but opposition is limited to two grounds—(1) that the person opposing has been robbed of the invention; (2) that there already exists a patent for the same invention. It will be noted that this last provision practically opens up the whole question of novelty, and might enable a rival trader to force an applicant to defend the novelty of his invention in its very earliest stages. In the case of a capitalist pitted against a poor inventor it is easy to see the hardship of such a proceeding.

No changes are made in the fees, but an alternative scale is given under which they may be paid annually. This scale is so arranged that a patentee whose patent lapsed at the seventh year period would pay slightly less in annual fees than if he paid a lump sum in advance.

The practice of "racing for the seal," as it is called, that is, the attempt by a later applicant to get his patent sealed before an earlier applicant, and, therefore, effective against him, is clearly done away with in the amended Bill. In the Bill as drafted this was not quite certain.

The question of amendment is treated more liberally than it originally was, rather wider powers being given to the patentee.

A new clause has been introduced rendering patents effective as against the Crown. This, it will be remembered by those who followed the account of the proceedings in committee, was carried against Mr. Chamberlain, and perhaps there are still hopes that this clause will not become law, because no corresponding alteration has been made in the form for the grant of a patent in the schedule. There the rights of the Crown are still maintained intact. The clause itself is similar to one in Sir John Holker's 1879 Patent Bill.

In the section devoted to legal proceedings there is inserted a new clause providing a remedy for groundless threats of such proceedings. In the miscellaneous section also there are one or two fresh clauses. Among these will be found provision for the case of an inventor who dies without applying for a patent, while another subsection instructs the Patent Office to keep on sale copies of specifications of all existing patents. This clause would be improved by the omission of the word "existing," as it is difficult to see why the Office should not resume the practice, discontinued a few years ago, of keeping in print all specifications alike.

The alterations in the governing body of the Patent Office, proposed in committee, were not pressed in consequence of Mr. Chamberlain's opposition, but the various modifications in the system, under which much originally left to the law officers would now be transferred to the Controller, will probably, to a great extent, meet the wishes of those who were anxious that the importance of the department should be secured by investing its head with, as far as possible, an independent authority. The autocracy of the Controller is however tempered by a provision that he is not to exercise his powers adversely to an applicant without first hearing him.

One more provision there is of considerable importance. In case of international arrangements being effected for the protection of inventions, a foreign patentee is to have priority over other applicants if he applies within six months of the date of his foreign application. This rule is, however, only to apply to foreign States with which international arrangements have been made. In all other cases it may be assumed that the legal interpretation of invention will still apply, and that the man who imports an invention at his own cost and risk from the distant shores of France or Holland will still, in the eye of the law, be the "first and true inventor."

There are many other minor alterations, but probably the above include the most important of those dealing with patents.

### ASPHALTE ROOFS.

A SUMMONS was lately taken out by Mr. Thomas Henry Watson, district surveyor of St. George's, Hanover Square, against Mr. Way, of the firm of Langmead & Way, builders, for covering the roof of a flat with asphalt at the house, No. 4 Half Moon Street, Piccadilly. The case was heard before Mr. de Rutzen at Marlborough Street police-court, on the 19th inst. Mr. Watson said that under the 19th section of the Metropolitan Building Act, 1855, the flat or roof over every building must be covered with slates, tiles, or other incombustible materials. He found that a flat at the back of the house, No. 4 Half Moon Street, had been covered by the defendant with asphalt, which, in his opinion, was not a proper covering of incombustible material as the Act required. He had tried a portion of the asphalt in question by holding it in a jet of gas flame, and it had burned and melted, and portions of it had dropped off in a melted state. He considered that with respect to the contingency of fire, asphalt was not a proper roof covering, and that if a fire occurred near an asphalt flat a shower of sparks or burning timber falling on it would set the asphalt covering of the flat on fire, and convey the conflagration to the adjoining premises.

In cross-examination by Mr. Poland, Mr. Watson said it was the first time he had ever taken proceedings with reference to asphalt roof coverings. He was aware the house next door, in Half Moon Street, had an asphalt flat at the back. He had passed those premises; possibly he did not notice it. He had not objected to it, and was not aware that asphalt flats had been largely adopted for roof coverings of late years by the Government, the Admiralty, the Mint authorities, by many local authorities, and then by the Metropolitan Board of Works themselves in blocks of houses erected under the Artisans' Dwellings Act. He

had never adopted asphalt flats; he did not consider them safe from fire. He did not know the chemical composition of asphalt, beyond the fact that it contained bitumen, and he considered that substance highly inflammable. The flat in question was laid in a concrete bed, about 6 inches thick; the concrete, of course, could not burn, but he considered the asphalt over it would. Mr. Poland here handed Mr. Watson a copy of one of Colonel Haywood, the city engineer's reports, with the results of experiments on asphalt as to its non-inflammability, and asked him if he differed from Colonel Haywood. Witness said those experiments were made on Val de Travers asphalt, and that might be correct, but he considered all bituminous asphalt inflammable.

Mr. Poland, in calling witnesses for the defence, said that this was a vexatious prosecution originating in a crotchet of the district surveyor with reference to asphalt generally. If Mr. Watson's contention were true, half the streets and pavements in London were covered with a material which would readily catch fire and spread it through the metropolis; whereas exactly the contrary was the case. Mr. Poland then referred to the "Notes on Building Construction" prepared for students in the Government Department of Science and Art, and under the heading "Asphalt" read the following description: "Patent asphalt is waterproof, fireproof, easily applied, and to some extent elastic."

Mr. D. Cubitt Nicholls said he was the architect to the premises in question. The drawings of the house showing the flat were sent to Mr. Watson, as district surveyor, before the works were commenced. The flat was a concrete one, and the asphalt laid over it. By no possibility did he consider the flat could communicate fire. If a fire spread to it, and the portion of the building adjacent caught fire, he considered it would help to put it out. He had laid a large number of asphalt flats, and had found them always successful. In cross-examination, witness said he considered asphalt a far better fireproof covering than lead. Lead would melt if hot burning timbers fell on it. The melted lead would set the boarding under it on fire, whereas it was impossible for concrete flats to burn, and asphalt would not run sufficiently to carry fire with it, but when melted would form a putty, which would put out fire. He considered asphalt on concrete far more fireproof than slates over boarding.

Professor Atfield, F.R.S., said he was professor of chemistry to the Royal Pharmaceutical Society. He had tested and analysed various sorts of asphalt in every way. All descriptions of asphalt contained a certain proportion of bitumen; and this bitumen, if extracted from the asphalt, would burn, but asphalt itself would not burn, as the proportion of bitumen it contained was too small to make it inflammable. No asphalt could be used to cover pavements if it contained more than 10 per cent. of bitumen, and it would not lay properly, even if of the commonest description. All asphalts contained at least 90 per cent. of earthy matter; such material would not only arrest fire, but put out flame far better than water. In cross-examination, witness said in any case it was impossible for asphalt to become a fire-conveying material. It was quite true that if a piece of ordinary trade asphalt was held in a jet of gas flame, and surrounded by it, as Mr. Watson had tested it, while so held in the flame, the bitumen in the asphalt would melt and run out of it and burn, while the gas jet was impinging on it, but the moment the gas flame was turned off the flame around the asphalt would cease—the asphalt itself would not burn, there was far too much earthy matter in it to allow it to do so. He considered asphalt flats far safer than either lead slates or tiles, and it was impossible for them to burn when the asphalt was laid on concrete.

Mr. Penrose, architect to the Dean and Chapter of St. Paul's Cathedral, said he had used asphalt to cover roofs in several cases, in one instance in Mr. Watson's district. Mr. Watson did not then object to it; he had used it for the roof over the choir rooms and schools connected with St. Paul's Cathedral. He considered concrete roofs covered with asphalt the best fireproof roofs that could be used. In cross-examination Mr. Penrose said he should not use it for the dome of St. Paul's Cathedral. He considered it good for flats, not domes. He thought it better and more fireproof for roofs than slates.

Mr. Robert Walker, F.R.I.B.A., architect and surveyor, said he had used asphalt for roof flats. In over thirty cases he had found it the very best material for covering roofs that could be used, for the purpose of preventing the spread of fire. He had never known a case where it had conveyed fire, but several instances where asphalt flats had retarded fire. In one case, where a block of cabinet-maker's workshops, built by witness, near Curtain Road, covered with asphalt and concrete flats, had caught fire, there were a large number of frames of cabinet-maker's work stacked on the asphalt flat to a considerable height. These were entirely burnt, and the asphalt on the concrete flat was not melted; had it been lead the building and contents must have caught fire. In another case the fire inside a cabinet workshop burnt itself out, and could not get through the roof, which was a concrete and asphalt flat. Witness, as district surveyor of St. Martin's-in-the-Fields, had a good illustration of the different effect of fire on leaden and asphalt roof coverings from the Alhambra fire. A building, two doors from the Alhambra, was severely injured by the charred and partly-burnt timbers which fell alight on the leaden gutters; that

melted the lead which set the roof-timbers on fire. An asphalte flat on an adjoining house, though the burning charcoal from the fire fell on it, was not burnt through, and the building did not catch fire; the hot charcoal merely melted the asphalte, which formed a sort of putty or soft mass, in which the charcoal became embedded, and the earthy matter in the asphalte, though it was a very common quality of asphalte, choked the flame in the charcoal and put it out.

The magistrate declined to hear any more witnesses, and said that he was clearly of opinion that asphalte was an incombustible material for covering flats within the meaning of the Act, and dismissed the summons.

### SHAKESPERE AND WARWICKSHIRE.

THE members of the Woolhope Club lately visited Stratford-on-Avon. Among other addresses delivered on the occasion was one by Mr. J. Tom Burgess, author of "Historic Warwickshire," and other works.

It had been truly observed, he said, that in this life there was nothing certain but the unexpected, and though it was a common remark by speakers that "they were unexpectedly called upon," it was never more truly applied than on the present occasion, when the Woolhope Club relaxed one of their strictest rules in order that he might say a few words. He should be untrue to himself if he denied that the proposal gave him pleasure, for "out of the fulness of the heart the mouth speaketh," and at the name of William Shakespere thoughts came with a power almost too great for utterance. From his earliest youth he had been a pilgrim at the shrine which has given Stratford a place in history, and many a time and oft he had been "the faithful one amongst the faithful many" at each recurring anniversary of the poet's birthday—St. George's day, be it remembered. The memory of these old-new associations brought home to him the fact that, though Shakespere was born when field-clubs were not, still he had an intense love of nature; he could notice the freckles of a cowslip as well as portray the tempest of passion in the human heart. Their president had quoted to them the eloquent words applied to Her Majesty in "Henry VIII.," and that reminded him that the first queen of bluff King Hal, when discarded and forlorn at the gates of death, called to her maidens and said,

When I am dead, good wench,  
Let me be used with honour; strew me over  
With maiden flowers; that all the world may know  
I was a chaste wife to my grave.

Act iv., Scene 2.

It said something for the rough and passionate soul of Henry that he spared the cathedral of Peterborough—the old minster of The Medehamstead—as a fitting tomb of Catherine of Aragon, his first, if not his best-loved wife. The eye that could see the

Willow growing ascaunt the brook,  
That shows his hoar leaves in the glassy stream,  
and

The gentle ripple kissing every sedge,

could give the world such thoughts, and shaped those thoughts in such language that appealed to every one—which the world cherished as the best and most valued of its literary treasures. The boy Shakespere and "the poet of all time" was no recluse, hoarding sentimental dreams in the cloister or the closet. He was a man of the world, living amongst men and women, observing their foibles and the springs of action, using up as he went along the garnered facts of others, which he polished and set until the rude pebbles became precious jewels. His contemporaries, envious of the fame which he himself seems to have despised, charged him with decking himself out in other men's garments; but they should not forget that the man who digs the clay, makes the bricks, or hews the stone, is not the architect or creator of the fabric in which princes love to dwell, artists admire, and poets love. So it was with the son of the gentle Mary Arden, and frequently he had gone from Snitterfield by the old tumulus at Pathlow to Wilmcote along the road which John Shakespere must have trod when he went courting the yeoman's daughter, who was destined to be the mother of one to whose birthplace they had that day made a pilgrimage. They could imagine the anxiety of that mother when the plague was raging, for the safety of her infant son. They could imagine her pride in his prosperity and fortunes. They could picture forth the stories she told of the deeds her ancestors had done, for it is shrewdly guessed that her grandfather had fought at Bosworth, from the neighbourhood of which bloody field the Shakesperes had migrated. There were passages in "Richard III." which seem to betoken an acquaintance with the detail of the last battle of the Roses, other than what was to be gleaned from books and chronicles, and he may have heard only at second-hand how Richard exclaimed—

Saddle White Surrey for the field to-morrow!

and thus it was that this great genius thought no detail too insignificant, no stupendous thought too grand to be embodied in his

marvellous plays—and in his heartfelt poetic effusions. It had been truly said that whilst he could give Hamlet an everlasting fame, he could remember to leave his wife his second-best bed. It was but right that such a man should be born in the heart of England, and that he should live in the hearts of every English-speaking people. As a Midland man, he was proud to be a loving fellow-countryman. He was proud of having a common lineage derived from the county of his fathers, and when in sickness or in sorrow he wanted his mind diverted and fed full of sumptuous things, he found an everlasting font of immortal words in those books of which the author seemed to have no care in his lifetime. He seemed to have been prouder to be a country gentleman than the author of "Lear." He left his beautiful Ophelia, Cordelia, and Imogen to the casual care of careless printers. He thought more of his barley apparently than his sonnets, and perhaps thought more of his lineage from the old Saxon Earls of Warwick, who are said to have been descended from Alfred himself, than of the queen and heroes—the stalwart soldiers and finest patriots—to whom he had given a lasting name and fame. The subject was a vast and a tempting one. Each gushing thought seemed overtaken by another. He felt that he was trespassing beyond the few minutes allowed him; he could only a

Round, unvarnished tale deliver

off-hand, a simple collation of crude ideas, when he would have liked to have set before them a rich repast. The trees, the hedge-rows, and the meadows bear witness to him. They are the faithful, truest witnesses of his fame, and seem to speak in a low monody—

We shall ne'er look upon his like again.

It had been a great pleasure to him to leave the bustle and toil of London to accompany the members of the Woolhope Field Club by the banks of the Avon, and he trusted that each one would remember with pleasure the day of their pilgrimage to Stratford.

### ANAGNI.

THE first of a series of articles, by Dr. E. A. Freeman, on the country between Rome and Brindisi, has been published in *The Guardian*. It describes the town of Anagni, which is girded by mighty walls. The hill of Anagni, says Dr. Freeman, is not, like the hills of Segni and Norba, an actual piece of the mountain itself; it is a hill, an isolated hill, a hill so large that, no less than at Segni and Norba, the city is wholly on the height; the walls merely fence in the hill-top. That hill-top is in some parts wonderfully narrow; in the middle of the town there is hardly more than the width of the chief street between the slopes on either side. And at its eastern end the hill rises to form a truer akropolis, with a steeper path up to it, than can be seen at Segni or Norba. Round the whole of this space, allowing for some late patchings, run the ancient walls of Anagnia, and a mighty and wonderful work they are. But who built them? We must confess that we walked round about them and, as we thought, marked well their bulwarks, in the full belief that we were studying the works of the ancient Hernicans. Let no one fancy that we did not mark the difference between the walls of Anagnia and the strange and mysterious forms which may be seen at Cori and Segni. The walls of Anagni bring us back within the ordinary range of wall-building as practised by ordinary mortals. Hernican Anagnia did not come within either Lord Macaulay's Latin or his Etruscan catalogue; but, had it done so, there would have been no temptation to speak of its bulwarks as "no work of earthly men," or as—

Reared by the hands of giants  
For godlike kings of old.

The walls of Anagni are wonderful only as the great works of Rome are wonderful. They are built by men to whom it was more natural to put together rectangular stones with some kind of regularity than it was to pile together huge polygons anyhow. They were built by men who thoroughly understood the principle of the arch, and who knew how to use it with all boldness. They remain, in various degrees of preservation, round the greater part of the circuit of the town. In some parts they are broken down altogether; in some they are supplanted, in others merely patched, by walls of later date; in short, they have gone through all the casualties which a wall is likely to go through in the course of two millenniums or so; but the wall of modern Anagni, as a whole, is still the old wall of Anagnia. The construction differs a good deal in different parts as to the size of the stones and as to their nature, and as to the degree of rudeness or finish in the work. In some parts the wall stands single; in others it is strengthened by further defences, buttresses rather than towers—defences, by the way, which must be carefully distinguished from the additions of later times. But one general character reigns throughout. The stones, greater and smaller, smoother and rougher, are always rectangular, and always laid with some measure of regularity. In some cases ranges of larger and smaller stones alternate; in

one part of the wall stones of two natures and colours almost alternate. The chief material is a light-coloured stone exactly like the *puft-stone* of Gloucestershire, the material of Berkeley Castle, and not a few other buildings in that neighbourhood. This is eked out here and there by the dark volcanic *peperino*, which, towards the south-eastern part of the wall, is used much more freely. The general effect, however, wherever the wall is at all perfect, is stately and striking in the extreme, both in form and colour.

One thing is plain, that the builders of the walls of Anagnia, like the builders of the *cloaca* of Rome, but most unlike the elder builders of Cori and Signia, knew as well as any men how to turn arches. On the highest point of the town, by the modern gate, which looks out towards Ferentino, within the circuit of the ancient *arx*, we may still see, blocked, partly hidden by the modern gate, disguised by the arrangements of the mediæval castle, the double gate of the ancient wall. It is perfectly plain, but with arches thoroughly well turned, with a double range of voussoirs. A smaller arch of the same workmanship beside them looks almost as if it had been blocked from the beginning. The *arx* itself, it should be remembered, had its separate wall within that of the city, a noble fragment of which, of exactly the same character as the town wall, is still to be seen in a narrow street a little lower down.

When we actually reach Anagni there can be no doubt that the character in which it chiefly strikes us is that of the city of the Hernican walls, if Hernican walls we may call them. But, historically, Anagni is so far more famous as the city of mediæval popes that it is fitting that it should have something to show in that character also. The town is rich in mediæval fragments. The main street, in its winding courses, displays long ranges of blocked arcades, round and pointed, which when open must have given it, narrow and often dim as it is, no small measure of stateliness. Not a few buildings stand out with arches of vast height and boldness, suggesting, as it is fit that one papal city should suggest to another, the mighty works of Rome's absent bishops at Avignon. Not remarkable for height, but most remarkable for their span, are the exceedingly bold arches which support the communal palace, once, it is said, the dwelling of the popes, a building which on its northern side shows a range of windows which savour of France or England rather than of Italy. The houses, with their staircases, often present highly picturesque shapes, which in one house in the main street, where the outside staircase is sheltered by two arches resting on a graceful column, grow into a form of genuine beauty. And an elegant form of double window, two round arches divided by a slender shaft, is characteristic of the architecture of Anagni. It is needless to add that at Anagni, as everywhere else in Italy, most of these relics of the skill of former times have been mercilessly disfigured and mutilated.

In the ecclesiastical line the other churches supply a few good fragments of the same character as those in the domestic building; but the cathedral church within the *arx* is the only one which has the least claim to be looked on as a striking whole. It stands boldly on the edge of the hill with its east end—that is, what would be east according to northern rules, for it is in truth nearly west—rising up nobly with its three apses in good Romanesque style, while a stately bell-tower of the more massive sort, though sadly marred on two sides, stands near the east end which should be west. The crypt is in a somewhat ruder form of the same style. The whole outside of the church is worth study; the inside is of an early and massive type of the Italian Gothic, always, unless in the case of some unusual merit, less satisfactory than Italian Romanesque. The sacristy contains the vestments of Innocent III. and Boniface VIII., and a good many other curious objects. The church is just now suffering restoration; let us hope that nothing very dreadful will happen to it. There, at least, seems no disposition to pull down the apse, after the pattern of the church which popes and emperors alike have decreed to be the mother church of Rome and of the world.

## THE SURVEY OF INDIA.

THE fourth report, that for the year 1880-81, of the amalgamated Department of the Survey of India deals with the work of the Trigonometrical, Topographical, and Cadastral Survey parties, with geographical and miscellaneous operations, and with the work of the head-quarter offices at Calcutta and Dehra Dun. The principal triangulation of all India was brought to a close during the year under review by the completion of the Northern Section of the Eastern Sind Meridional series. Outside the limits of India Proper a chain of triangles, known as the Eastern Frontier series, was very nearly completed.

Thirteen separate parties were engaged in topographical work in connection with previously projected surveys. Of these, three parties were employed in Rajputana and Central India, four in the Bombay Presidency, and the remaining six in various parts of other provinces. The first three parties were working nearly parallel to each other, from east to west, across the breadth of Central India and Rajputana. The most northerly party had

advanced in its survey of Rajputana to the sandy deserts of Jeelsumir, and so devoid is the country of topographical features that a scale of one-half inch to the mile was considered sufficient. South of this party a second was engaged on the survey of the petty Central India States lying around Mount Abo. The third and most southerly party had advanced out of Bhopal and Malwa, where it first broke ground in 1870, into Rutlam and Banswara. Over 24,000 square miles of country had already been surveyed by this party, and some 4,000 miles remained before the frontiers of Gujarat would be reached. In a very few years the topographical survey of the whole of Central India and Rajputana, from the Central Provinces on the east to the Punjab and Sind on the west, will be completed, and accurate maps will be available of this comparatively unknown and difficult country. Of the four parties employed in the Bombay Presidency, one was in Gujarat, a second in Khandesh, and two others in the Deccan and in the Concan respectively. The Gujarat party had completed the survey of 14,300 square miles, and had 16,700 more to do. This survey, like the other topographical surveys in the presidency, was being made chiefly on the two-inch scale, and mapped both on the two-inch and on the reduced one-inch scale. Specimens of the Gujarat maps were exhibited at the Venice Geographical Congress, and obtained the honourable reward of a gold medal. In this survey much of the topographical details were taken from the field maps of the Bombay Revenue Survey. The economy of this is obvious, and the more recent work done by the Survey Settlement Department of the presidency approaches in its accuracy a scientific survey. In Khandesh the survey was approaching completion, as only 2,650 square miles remained unsurveyed at the close of the season. The Deccan party was chiefly engaged in the survey of the Kaladgi District, and the adjoining native states of the Satara District. The northern half of the Deccan has now been topographically surveyed, and the second party which was formerly employed there was, during the year under review, engaged on the survey of the Concan. Good progress was made by all the four survey parties in the presidency, though in the Concan the difficult nature of the ground made the outturn relatively small. Topographical surveys were also prosecuted in Kohat and Baluchistan, Cutch, the North-Western Provinces, Sylhet, and Mysore. The two former are important from a military point of view. In Baluchistan the party surveyed and mapped several thousand miles of the country north of Quetta, and between Quetta and Khelat. These surveys were on the half and quarter-inch scales. In Kohat the smallness of the party employed told against the outturn of work for the year. The operations of the Sylhet and Cutch parties do not require particular remark. In Mysore the topographical survey of the province was being pushed on as fast as circumstances would permit; 12,754 miles had been surveyed on the one-inch scale, and 17,800 miles remained to be done, but most of this latter area had been triangulated in advance. The party in the North-Western Provinces was employed on the topographical survey on the two-inch scale of the Gangetic Doab. For this survey the boundaries of villages were being ascertained from the Revenue Settlement maps.

The one *mauzawar* or revenue survey party which was employed in the Punjab, completed the survey of Dera Ismail Khan on the four-inch scale, and also surveyed some small forest areas in the Rawalpindi district. It may be noticed that the term "revenue survey" as applied to the four-inch surveys, which has now been practically completed in the Punjab, is a misnomer. It has no immediate connection with the land-revenue administration or the assessment of revenue, and where settlements are in progress a separate field-to-field survey is made by provincial survey parties under the Settlement Department. The latter, it is true, are able to utilise the topographical information and fixed points of the Imperial "revenue survey" maps, but beyond this can derive but little assistance from them.

Cadastral or field-survey operations were vigorously prosecuted in the North-Western Provinces and in British Burma. Of the three parties employed in the former province one completed the survey of the Jaunpur district; the second made good progress in Mirzapur; and the third completed the districts of Ghazipur and Ballia with the exception of 858 square miles. The survey of the permanently-settled portion of the North-Western Provinces was thus rapidly approaching completion. In British Burma three parties were at work in connection with the revision of the land assessment of the province. The largest outturn, 786 miles, surveyed on the 16-inch scale, was attained by the party employed in the Hanthawaddy district. In Bassein progress was impeded by heavy jungle and the scattered character of the cultivation. In the Tharawaddy district the party was a newly-formed one, which began work late in the season, and the outturn was therefore only 461 square miles.

Geographical knowledge in Afghanistan was extended by the surveys made in Waziristan in connection with the Waziri expedition. Kandahar and the surrounding country was also surveyed. No less than 39,500 square miles of Afghanistan have been surveyed, in more or less detail, since the British occupation in 1879. The great services rendered to the army by the Survey Department have been frequently acknowledged by military authorities.

The tidal operations of the department consist of the registration of tides at fourteen ports in India, Burma, and the An-

damans. The observations taken at the several stations are reported to the superintendent in charge of the operations, and furnish the basis of subsequent calculations. The instruments employed were exhibited at the Venice Congress, and obtained a first-class medal.

The attempt to connect the mean sea levels of Madras and Bombay by a line of spirit-levels carried directly across the peninsula was disappointing. The result makes the mean sea level about three feet higher in Madras than Bombay, and the difference is considered to be due to some flaw in the levelling operations.

There remain for notice the mapping and other scientific work done during the year in the head-quarter offices of the department. The issue of a new map of India on the scale of one inch to 32 miles was perhaps the most important performance in the map department. It has deservedly been appreciated by the general public for its clearness and fulness of detail. A map of Southern Afghanistan in four sheets, and many other important topographical maps, were also published. The work in connection with the cadastral surveys was very heavy, as no less than 4,545 new maps were issued, most of them being executed by the photozincographic process.

The cost of the surveys executed by the topographical branch is not given. In this respect the details furnished for the revenue branch are more complete. The cost of the topographical work done in that branch was 25 rupees the square mile in the Deccan, 33 rupees in the Concan, and 31 rupees in the Meerut division of the North-Western Provinces. There was a satisfactory decrease in the cost of the cadastral surveys; the party in Ghazipur were working at the low rate of 163 rupees per square mile, and the party in Mirzapur at the still lower rate of 140 rupees. The Burma surveys are naturally more expensive, but the rate of 200 rupees the mile to which the survey of the Hanthawaddy district had been reduced was considered extremely creditable. It is hoped that the cost of cadastral work may eventually be still further reduced, and the main objection to such surveys removed. The abolition of field-books has proved to be a most economical measure, and conclusive testimony has been supplied from British Burma and the North-Western Provinces in favour of the present system of plotting the measurements direct on the maps. If this one reform has increased, as has been stated, the outturn of work by one-fourth, the extreme importance of simplifying methods of work, and of utilising existing agencies, is obvious.

Up to the end of the year 1880-81 eighteen districts of the Madras Presidency had been taken up for survey; altogether 47,802 square miles of revenue survey and 42,000 square miles of topographical survey had been finished, leaving 13,733 square miles of cadastral survey and 17,258 of topographical survey to be completed in those districts. During the year field parties were employed in ten districts, and the outturn in field demarcation and survey was 1,322 and 1,324 square miles respectively. The publication of maps was carried on as usual in the central office. The traverse work of the revenue survey was connected with 54 stations of the trigonometrical survey, and the comparison of distances showed a mean error in traversing of 7.55 feet per mile. The total outlay of the Madras Revenue Survey Department during the year 1880-81 was 56,952*l*.

Thirty-eight parties were employed during 1880-81 on the revenue survey of the Bombay Presidency. The outturn comprised the measurement and classification of 3,416 square miles. Survey operations were in progress in the native states of Savantvadi, Bhor, Kolhapur, and the Southern Maratha feudatories, the expenditure being defrayed by the respective states. The outlay of the Bombay Revenue Survey Department during 1880-81 was 59,571*l*.

The city survey, which had been introduced into ten towns in the Presidency, was still not quite completed for Ahmedabad, Dharwar, and Hubli.

#### Asphalte and Concrete Flats.—Watson v. Langmead & Way.

SIR,—Permit me to offer a word of explanation why I gave evidence against Mr. T. H. Watson, another district surveyor, in the case of Watson v. Langmead & Way, with reference to asphalte flats.

During the past year Mr. Vulliamy, the superintending architect to the Metropolitan Board of Works, has sanctioned and approved a large block of artisans' dwellings lately erected in my district, covering nearly the whole site of Newport Market, or nearly half an acre of land; the whole of these blocks of houses, thirteen in number, are entirely covered with concrete and asphalte flats, used as drying-grounds and play-grounds for children.

When Mr. D. Cubitt Nicholls mentioned the small flat Mr. Watson objected to at the back of the house in Half Moon Street,

I felt that I was in an awkward dilemma. If Mr. Watson succeeded in his case, it would become my duty to proceed against the owners of these houses for work covering nearly half an acre of land, which Mr. Vulliamy had approved, sanctioned, and passed, and which I myself entirely approve, as, from large experience in this matter, I know that concrete and asphalte flats are the best possible roof coverings for this class of dwellings.

The magistrate said that in these cases he always preferred, where two district surveyors differed as to the meaning of any part of the Building Act, that they should try and settle it before they came into court. From my experience of Mr. Watson's conduct in a former case I had with him in his district, I knew it would be useless to try and adopt this course. I am informed it is now attempted to be proved that the asphalte at Half Moon Street was of an inferior quality; this I absolutely deny, and Mr. Watson attacked in his evidence all asphaltes in general as a roof covering.

The obvious moral from the case is that district surveyors, before hastily summoning builders with respect to modern applications of new materials, should ascertain what other district surveyors and architects are doing, and not rely entirely on their own experience, especially when that, as in this case, was limited to a mere experiment in a jet of gas flame.

Yours, &c.,  
ROBERT WALKER, F.R.I.B.A.

#### ART SCHOOLS.

**Liverpool.**—The new art school will be opened on Monday, the 30th inst. The building occupies a conspicuous position at the corner of Hope and Mount Streets, and has a frontage to the latter street of about 130 feet, thereby securing an excellent north light, which is a great desideratum in a building of this class. The principal entrance is placed in the centre of the Mount Street façade, access being obtained by three short flights of stone steps 11 feet wide, and which lead up to the ground or principal floor level. Directly facing the principal entrance is a spacious hall and staircase, at the foot of the latter being a row of polished Scagliola columns in imitation of verde antique marble. The staircase is amply lighted by three large semicircular-headed windows of embossed plate-glass, and having Scagliola marble pilasters between. The staircase is of stone, the flights being 6 feet wide, having Spanish mahogany hand-rails, with ornamental iron balusters of very chaste design. The floor of the entrance vestibule, hall, and staircase is laid with ceramic mosaic paving from specially prepared designs. The corridors of communication to the different apartments are 6 feet wide. The accommodation on the ground-floor comprises attendant's-room, male and female cloak and retiring-rooms. The dimensions of the different rooms are as follow: First elementary-room, 52 feet by 25; second elementary-room, 29 feet by 23; architectural-room, 29 feet by 23; modelling-room and store-room; and, on first floor, painting-room, 26 feet 6 inches by 25 feet; life class-room, 32 feet by 25; first antique-room, 54 feet 9 inches by 33 feet; second antique-room, 29 feet by 23; and headmaster's-room, 23 feet by 11. A lift is also provided in the building. The doorways from corridors to the different apartments have moulded pedimental heads; and the windows, where needful, are provided with Messrs. Bennett & Co.'s revolving wood shutters, by means of which the admission of light may be regulated to suit the various requirements. The rooms are warmed by means of Messrs. Yates, Haywood & Co.'s slow combustion stoves, additional heat being also obtained by carrying up the smoke-pipes almost to the full height of the room before connecting to the flue, and, they being surrounded by an ornamental iron casing, a pleasing appearance is obtained. The corridor and staircase are warmed by hot-water pipes. The building is ventilated by means of Messrs. Robert Boyle & Son's patent air-pump ventilators, with the necessary extraction flues for foul air connected to same. Fresh air is admitted to the various apartments through Tobin's air-tubes. The gas-lighting arrangements are being executed by Messrs. Sugg & Co., of Westminster. The building externally is faced with Cefn stone, except the portion below ground-floor level, which is of Runcorn stone. The style of architecture adopted is Palladian in character. The roofs are covered with Port Dinorwic green slates, and the internal joiners' work is of pitch pine, stained and varnished. The building has been erected from the designs and under the superintendence of Mr. Thomas Cook, architect and surveyor, of 12 St. George's Crescent, Liverpool, who obtained the first premium in a competition for the building. The cost, including furniture and fittings, has been about 12,000*l*. Mr. Wilkinson Bell has acted as clerk of the works in a very efficient manner. Mr. Samuel Webster, of Brasenose Road, Bootle, has been the sole contractor for the work, the sub-contractors for the different branches being as follows, viz.: Brickwork, Messrs. Roberts & Robinson; masonry, Mr. Jones; ironwork, Messrs. Price & Scott; slating and plastering and Scagliola work, Mr. Thomas Jones, Mount Pleasant; plumbing, glazing, and painting, Mr. John Powell, Mount Pleasant; stoves and ornamental balusters, Messrs. Yates, Haywood & Co.,

Wood Street; heating apparatus, Messrs. Tessmund & Kissack, Blackstock Street; ceramic mosaic paving, Mr. George Swift, The Temple, Dale Street; ornamental railing and gutters, Messrs. George Smith & Co., Glasgow; hoist, Mr. A. Abbot, Lord Street; furniture and fittings, Messrs. Brown & Backhouse, Chatham Street; ventilation, Messrs. Gibbs & Son, South John Street.

### SANITARY WORKS.

**New Baths, Whitehaven.**—New baths and washhouses for the town are being constructed. All the external walls are ashlar, and the work inside and out is to be of the same quality. The principal front, although the narrowest, is in Duke Street. In this front is the entrance to the baths, which is dignified by a Roman Doric portico. The wall surrounding the Turkish bath has on its external surface carved subject panels. Passing through the door a wide lobby is entered, and ascending six steps and passing the ticket office, the waiting-room is reached. This room is centrally placed for swimming-bath, private baths, and Turkish bath. Upon this floor are the gentlemen's private baths—which can either be salt or fresh water—and the cooling-room of the Turkish bath in the Moorish style, lighted by a lantern filled with many tinted glass. There are four couches in this room. Attached to this room is a small closet for storing valuables, in charge of the attendant. Descending a staircase leading from this room we reach the hot rooms. They are three in number, the last being the hottest, and slightly elevated above the other two. The shampooing-room has a tiled floor and two marble couches. After being shampooed, the bather has the choice of taking either the shower, spray, or plunge bath. He then ascends to the cooling-room, where, reclining on one of the couches, he can have a cup of coffee and a cigar. The private baths are tastefully fitted up and supplied with Rufford's porcelain baths. The ladies' baths, with separate waiting-room, are on the first floor, and are in every respect the same as those for the gentlemen. The swimming baths, which will be filled with pure salt water pumped from end of North Pier, is 54 feet 6 inches by 30 feet; 3 feet 6 inches deep at the shallow end, 5 feet 6 inches deep at the other, and 7 feet deep 15 feet away from the diving-board. There are twenty-two dressing boxes, and a shower bath. This room is adapted for a gymnasium or lecture-hall, for which purpose it may be used in the winter months, when a floor would be put across the bath. In one corner of this building there is a small room with vapour and needle baths. Medicated baths will also be attainable. The wash-house is entered from Peat Place. It is a one-storied building with a light iron roof over. It will be fitted with every modern appliance for washing and drying. There are thirty-eight stalls for washing in, supplied with hot and cold water. There are also two hydro-extractors for rinsing the clothes. In the centre of the room is the drying closet. Half the stalls are so arranged that the clothes can be washed in perfect privacy, each woman being able to wash and use the drying-room without leaving her stall. In connection with this wash-house is a mangle, ironing-stone, waiting-room, pay-office, store-room, &c. There is also a private wash-room for the Bath Company's things. Close to the wash-houses is the engine-house. This is entered from Strand Street. The boiler is a Cornish steam boiler, 14 feet long and 4 feet 6 inches diameter. The engine is a four-horse vertical engine with 7-inch diameter cylinder. In addition to pumping the salt water and supplying the motive power for the wash-house, it is proposed that it should work a dynamo-electric machine to light the whole of the premises by Swan's incandescent lamps. Mr. T. Lewis Banks (now Messrs. T. L. Banks & Townsend), of Whitehaven and London, is the architect.

### CHURCH BUILDING AND RESTORATION.

**Groombridge.**—The foundation-stone of a new church at Groombridge has been laid. The church, which will be built of local sandstone, is designed in the Late Decorated style, and will consist of a nave, chancel, organ chamber, vestry, &c., and will accommodate 200 persons. Mr. Norman Shaw, R.A., is the architect, and Mr. Payne, of Crowborough, the builder. The estimated cost of the structure and fittings is 2,000*l*.

**Cilgwyn Church, Pembrokeshire.**—The Bishop of St. David's reopened this little church on Tuesday, the 17th inst., after a restoration which has practically amounted to a rebuilding, a small portion of the walls only being sound enough to retain. The simple parallelogram outline of the building, with its continuous roof, has not been changed, but the chancel portion has been marked outside by an ornamental cresting, and inside by an arched boarded ceiling, the nave roof being open up to the ridge, and plastered between the rafters. A new oak-framed porch has been placed on the south side, the entrance altered from the wall opposite, and a new oak-framed bell spirette, in harmony with the porch, has been placed at the west end. The slates are from a local quarry, the window and doorway stonework from the Forest of Dean, the encaustic tiles from Webb's Worcester Works, and

the wrought ironwork from Messrs. Brawn, of Birmingham. The accommodation has been raised from sixty-four to ninety-one, the fittings being all new of pitch pine, the old richly-carved square Norman font bowl being mounted on a new base. The restoration has been principally due to the efforts of Mr. J. B. Bowen, of Llwyngwair, late M.P. for the county of Pembroke, assisted by a grant from the Incorporated Church Building Society. The contractors were Messrs. Thomas, Joshua & Griffiths, of Kilgerran, and the architect Mr. E. H. Lingen Barker, of Hereford.

**Newtown.**—A new Baptist chapel has been opened in Newtown. The cost of erection, with site, &c., has been about 10,000*l*. The building was designed and carried out under the direction of Mr. George Morgan, architect, of Carmarthen. Mr. C. Young, of Pembroke Dock, was the clerk of the works, and Messrs. Griffiths, Vaughan & Co., of Knockin, near Westfelton, Salop, were the contractors.

**Preston.**—The new church of St. Matthew, New Hall Lane, Preston, has been opened. The church is erected from designs prepared by Mr. J. Hibbert, of Preston. At present only the nave and aisles are completed, but it is intended later on to remove the north-east wall and erect a chancel, organ loft, and tower. The cost of the church so far is about 6,500*l*.

### GENERAL.

**Mr. Herkomer, A.R.A.**, has been awarded a diploma of honour in the section of painting of the Amsterdam Exhibition.

**M. Conrad Freyberg** has obtained a commission from Prince Frederick Charles to paint the memorable scene of the surrender of the French standards at the capitulation of Metz.

**Mr. Charles Vacher**, the water-colour painter, died at his residence, in South Kensington, on Saturday last.

**Mr. R. R. Farrer, Fellow of All Souls' College**, died on Saturday at the early age of twenty-six. He travelled through a great part of Greece, and contributed some of his observations to *The Architect*. Mr. Farrer was joint author with Lord Windsor of a volume entitled "A Tour in Greece."

The Greek Government have intimated that a site will be granted in Athens for any buildings that may be required for the proposed British school. The subscriptions for the project now exceed 6,000*l*.

**Messrs. R. Dennett & Ingle** constructed the fireproof flooring in the new Shire Hall at Shrewsbury.

**A Lace Manufacturer of Nottingham**, Mr. Cutts, in recognition of the advantages derived by the study of design in the Nottingham School of Art, has given 20*l*. towards the annual local prize fund for the best lace designs executed by the students.

The "Dundee Advertiser" says that the Perth Town Council have resolved to raise an action in the Court of Session to compel the North British Railway Company to remove the ruins of the old Tay Bridge before proceeding with the erection of the new one.

**Ingestre Hall**, one of the seats of the Earl of Shrewsbury, is being restored after the late fire, under the direction of Mr. Birch.

The Rochester Bridge Wardens have resolved, so it is said, with the sanction of the Charity Commissioners, to spend 20,000*l*. of their surplus funds for purposes of middle-class education in Maidstone and Rochester, 3,000*l*. for the embankment of the Strood, 3,500*l*. for a pier at Chatham, 1,200*l*. for a pier at Rochester, and other large sums in improved bridges across the Medway.

**Messrs. W. B. Wilkinson & Co.** have issued a new edition of their descriptive catalogue, which contains an elaborate list of works executed by the firm.

The New Infirmary at Bolton was opened on Saturday last. It is on the pavilion principle, and has cost about 35,000*l*.

A Site has been purchased from the War Department at Portsmouth for a college for Roman Catholic priests.

**Columbia Market, Bethnal Green**, which was constructed in 1869 at a cost of 200,000*l*., and has hitherto been a failure, was again re-opened last week as a fish market.

**Thompson's System of Valuation** has been applied to the Board Schools in Great Jackson Street, Manchester, as well as to weaving-sheds and warehouses.

The Royal Institute of Painters in Water-Colours have taken studios in Great Ormond Street, for the purposes of the schools they are about to establish. The instruction in these schools will be wholly gratuitous, but it is not intended for any but those who have, to begin with, a fair proficiency in draughtsmanship. There will be classes for the figure, for landscape, and for still life in water-colour, and likewise a class for black and white. Specimen drawings by intending students must be sent in for examination by the Council by September 1, and the classes will begin a little later in the autumn.

# SUPPLEMENT

TO THE

# ARCHITECT

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, JULY 28, 1883.

### COMPETITIONS OPEN.

**BELFAST.**—Aug. 1.—Designs are invited for proposed Public Library. Premiums of £100, £50, and £25. Mr. Samuel Block, Town Clerk, Town Hall, Belfast.

**BRISBANE.**—Nov. 30.—Plans are invited for the Erection of a Town Hall. Messrs. Gordon & Gotch, 15 St. Bride Street, E.C.

**TURNNEY'S**

**SIZE**

**POWDER.**

**TURNNEY'S IMPERIAL CONCENTRATED**

**SIZE POWDER**

FOR THE IMMEDIATE MANUFACTURE OF SIZE.

Specially prepared for the use of House Painters, Decorators, and Manufacturers. Celebrated for its purity and strength. Guaranteed free from anything calculated to injure Colour or Fabric.

*This Preparation possesses the following advantages over ordinary Size:—*

- 1.—It is cheaper, being equal to ten or twelve times its weight of Patent Size.
- 2.—It is more efficient, the Size made from it being more tenacious, and perfectly pure.
- 3.—It is more convenient, a Size of any strength, and in any required quantity, being made at any minute, thus saving time and waste.
- 4.—Will keep any length of time in a dry place, and is therefore never liable to become mouldy, or acquire a disagreeable smell.

*This Powder supplies a want long felt by all users of Size, as it at once does away with the great inconvenience of the old method, and supplies a Size both cheaper and more efficient.*

Packed in Cases containing 28, 56, and 112 l-b. Packets. Samples, Prices, and Testimonials on application.

PREPARED ONLY BY THE ORIGINAL MAKERS,

W. J. TURNNEY & CO., LEATHER, PARCHMENT, & GLUE WORKS, STOURBRIDGE.

# The Architect.

## THE SOANE MUSEUM.

TRAVELLERS, as we all know, may often find close at home what shall be quite as well worth seeing as that which is further afield; and in these days of returning Classic taste we need not hesitate to recommend our young architectural tourists of London, while they may perhaps be thinking a good deal about France and Italy, happily becoming more easily accessible every year,

not to forget Lincoln's Inn Fields, a spot so very easily accessible as to be incapable of becoming more so, where the study of architecture, and of a good deal besides that is of interest to the architect, may be pursued at a leisure hour any time, without even the expense of an omnibus ride.

In the early years of the present century one of the two or three leading architectural practitioners in London—architect, for instance, to the Government and to the Bank of England—was Sir JOHN SOANE, Royal Academician, and immediate predecessor, if we calculate rightly, of Mr. C. R. COCKERELL as the Academy Professor. In respect of artistic taste he was, of course, of the Greek school; and the well-known "Bank," which constitutes the centre of the City of London, as of the whole monetary world, is a building of his which, although of less pretentious bulk, or bulkiness, than many towering edifices of later date in the neighbourhood, has always been held in the highest honour as an example of elegant proportion and dignified repose, combined with strictly characteristic effect—the *chef-d'œuvre* of a very good if not a very great architect. In his later years he adopted a curious whim (the admirable OWEN JONES, by-the-by, drifted into a precisely similar fancy), as if he had grown tired of all ambitions, and even of academical design, and were seeking relief in ultra-simplicity; and the house in Lincoln's Inn Fields, which was then his residence and is now his Museum, is one of the most characteristic specimens of a mode of design which he introduced as a new style of his own, but which, in its singular poverty of effect, produced by the repudiation of all moulded detail, and the substitution of nothing else but mere grooved panelling, is so utterly futile as to be out of the reach of criticism. At any rate, a natty odd-looking little house, which stands near the middle of the north side of Lincoln's Inn Fields, and is of an aspect so very much out of character with the place that it can not possibly be mistaken, is the Soane Museum of Architecture.

In his very old age Sir JOHN SOANE found himself a solitary occupier of this house under somewhat trying circumstances. An incompatibility of temperament having become chronic between him and his only son, GEORGE SOANE the critic, who had gone so far as to lampoon his father in the press, he had disinherited this disloyal descendant, and had resolved to devote his fortune to the benefit of the profession in which he had acquired it. Accordingly, he made arrangements for the establishment of an architectural museum and the endowment of an architectural charity. The Charity took the form of a fund in consols, the dividends of which, as they accrued, should be distributed amongst needy persons claiming a connection with the architectural profession. The Museum, on the other hand, was to be this his own private house, containing, as they stood, his collections of drawings, books, models, casts, sculptures, paintings, and curiosities, to be preserved in perpetuity for the free inspection and study of all applicants.

The house was crammed as full of those articles as any house could well be; and so it is still. Indeed it was, and is, more than merely crammed full. Besides the rooms and staircase of ordinary use, there are special mouse-holes of passages and galleries in which the visitor is literally unable to turn, and yet whose every foot of wall-space is covered with some thing of value. A celebrated mummy, amongst other objects, with its sarcophagus, occupies the basement. The windows of the rooms have shutters, which carry pictures, and which, when turned on their hinges, disclose to view other pictures of equal importance carried on the reverse or back. Quaint "dodges"

in the way of lighting, for the contrivance of which SOANE was not a little celebrated (as in his old Law Courts at Westminster Hall, recently vacated), pervade the place, and serve to multiply with surprising ingenuity the availability of surfaces. Famous paintings by famous painters—as HOGARTH'S series, *The Rake's Progress*—stand on screens for want of better hanging. Collections of gems and other delicate objects of art occupy the window recesses. Noble statuary is set up almost anywhere and anyhow in the miserably contracted space. In a word, the whole exhibition is stuffy and almost stifling with mere crowding, like any "old curiosity shop" in Wardour Street or Hanway Yard; and, although the stock (in the language of commerce) is manifestly of considerable money value and of no little artistic merit, the display is more than anything else a *memento mori*—a memorial of the contracted intelligence of a most worthy gentleman who, less than fifty years ago, could commit himself to the act of bequeathing such a house and such contents to the British nation in perpetuity as a Museum of Architectural Art.

Our ideas of a Museum of Art have indeed wonderfully changed since Sir JOHN SOANE'S day. Sir HENRY COLE and South Kensington need only be mentioned, without a word of comment or of explanation, to indicate the force of the difference. Even the singularly discouraging adventure which "under the shadow of the Abbey" has so long and hopelessly struggled to represent little beyond the art of Mediæval carving, may be quoted as an example of the inevitable failure that must attend the efforts of inadequate means in the best direction to overtake the rapid artistic developments of the present generation. The Soane Museum is in fact quite behind the age; so far behind the age, indeed, as to be what is familiarly called nowhere. It is not in the slightest degree too much to say that it is useless, a mere waste of house-room and capital and attendance. And yet, as we have said, the collection of architectural and other artistic objects is of very considerable value and of very considerable merit. It is not the first time the question has been asked, and we have no sort of hope of obtaining an answer; but we cannot help inquiring once more, What is the right thing to do with the Soane Museum?

The time surely must come before long when the Royal Institute of Architects shall assert itself before the public and the architectural profession in a very different attitude from that which it assumes at present; and if this is to be well done when it is done—and we do not say it ought not to be done quickly—probably the acquisition and maintenance of a technical museum must be one of the prominent features in the advanced programme. The transfer of the Architectural Museum at Westminster to the charge of the Institute has frequently been suggested as a step in the right direction. It is scarcely necessary to explain, however, that this would only be a transfer of financial difficulties; and thus it is quite natural that the Institute has not been able to see its way to accept a valuable collection of specimens at the cost of providing the quarters and the outgoings for its utilisation. But if a similar proposal could be brought about with reference to the Soane Museum, would not the case be altogether different? We do not imagine for a moment that the Institute would seek to make a pecuniary profit out of such a transaction, but certainly there need not be any pecuniary loss. The endowment of the Museum is sufficient for its maintenance, and this not merely in its present useless form, but in such an improved form as to adopt it to the altered condition of our own day, and, indeed, to the progressive condition of modern art at large. Not only so, but the memory of Sir JOHN SOANE, as a trust not by any means to be ignored, would obviously be all the better cherished in advancing honour, and the many very valuable items in the catalogue of his possessions would be assigned the full importance which is due to his respect for them, as well as to their own undoubted value and interest.

The purpose which the endowment attached to this Museum specially serves would, we think, in any such arrangement as this, be followed out not in any indirect way, but in full accord with the founder's real motive. It would enable the Institute to provide, in the public interest, as there seems no other way of doing, accommodation and maintenance for the whole of an appropriate display of architectural and kindred objects, for which the SOANE collection and the Westminster collection combined would be an admirable foundation. Not an article of Sir JOHN SOANE'S need ever be displaced, not

even the mummy; the only difference so far would be that everything would be better displayed in more ample space, and under more authoritative patronage, and the name of the founder, therefore, more conspicuously honoured. We venture, with all possible respect, to commend the suggestion to the honourable trustees of the Museum for their most serious consideration as a public question.

## M. JULES LEFEBVRE.—II.

[BY A CORRESPONDENT.]

LEFEBVRE returned to Paris in 1867, bringing with him the last picture painted by him at Rome, *Cornelia, Mother of the Gracchi*, for which M. DE NEWERKERQUE, the superb Surintendant des Beaux-Arts, whose princely fêtes at the Louvre will be recorded among the *fastes* of the Second Empire, offered him the 6,000 frs. always paid by Government for the last *envoi* of a Prix de Rome. Two hundred and forty pounds is a sum not inconvenient in the purse of a rising artist, yet LEFEBVRE refused it because of other and more important work. He was desirous of paying a visit to his family at Amiens, whom he had not seen for five years. He took that opportunity of making the splendid portrait of his sister, which he exhibited at the Salon of 1868 with *La Femme Courbée*, which latter work excited a perfect furore. He drew his sister in black, the sleeves of her dress being of a transparent material. Thus the modelling of the arms is revealed. Her slight figure, blond *cédrée chevelure*, expressive eyes, and sweet smile combine to create an attractive portrait. The *fond de vert d'eau* contributes to show to advantage the gold-brown of the hair and the delicacy of the complexion.

*La Femme Courbée*, an infinitely difficult subject in technique, is correct and refined. She reposes on a couch, her right arm is rounded in the act of raising her hand to her lips, the left rests on the arm of the sofa, which is of an intense crimson, partially covered by a drapery of a lighter tone; her features are beautiful, her expression arch and yet sweet. The medal of the Salon was indubitably due to this work. At the first ballot five votes were given to COROT, five to LEFEBVRE, and two to BRION. The latter carried the day at the second ballot, partly in accordance with the desire of M. DE NEWERKERQUE.

In 1870 the picture familiar to most of us was exhibited with the portrait of *Mlle. Raimbeaux*. *La Vérité*, now at the Luxembourg, is the figure of a magnificent woman, who holds the lamp of truth above her head. The draughtsmanship is broad and academic, the modelling powerful. Instinctively one recalls *INGRES' Source*; but the latter brings before us a girl in all the fascination of extreme youth, whereas *Truth* is a woman who, with dauntless resolution, holds the lamp destined to sweep imposture, deceit, and all manner of hypocrisy from her path. "*Quand même Truth!*" is her cry. The rectilinear *audace* of the outline, the purity of the form, the warmth of the carnations, are reminiscent of the artists of the Renaissance period. Absolutely nude, *La Vérité* is absolutely chaste. At the Luxembourg it is hung near the portrait of a woman covered to her throat and attired in sober black. Of the two pictures, it is impossible to deny that the impression of purity is rather conveyed by the unclothed than by the clothed figure.

In 1872, besides the portrait of *Madame Claudon*, JULES LEFEBVRE exhibited *La Cigale*, one of the most enchanting of his works. The child-Jewess has danced all the summer, and, like the *cigale* in LA FONTAINE'S matchless fable, has forgotten that to summer warmth will succeed the chill blast of winter. Her gay apparel has been sold for a morsel of food. To keep out the icy wind, which drives with pitiless force against her tender limbs, there remains but a bright-hued scarf, a glittering bracelet, and the tresses of her raven black hair. One feels that the child's figure shivers, yet there is youth and life in the sparkling eye and ruby lips, so delicate in their curves. It was bought by Mr. LATHAM, and is now at San Francisco. *La Madeleine*, the property of ALEXANDRE DUMAS fils, was painted in 1876. Magnificent from a plastic point of view, the picture is yet painful because of the suffering it expresses. The attitude is that of despair. She is prostrate on the ground, partly resting against a rock in a corner by the edge of a lake. Her arms are raised above her

head in the anguish of her soul; she wishes for death, which refuses to hear her cry of agony. Mr. VANDERBILT purchased *Mignon*, so popular in the Salon of 1878. Intensely sad stands the child, her little skirt torn by the brambles of the thicket, through which she has plodded her weary way to the seashore; her wealth of dark hair is gathered in a scarlet kerchief to the top of her head; with wistful eyes she gazes across the water to the horizon, where lies the "Heimath" she fain would reach. Exquisitely delicate in execution and sentiment is this work, which made a sensation when exhibited. In 1880 *La Diane Surprise* caused the sharp contest between Mr. DUNCAN and the Government, to which we have alluded. In truth it is a superb work. ACTÆON is supposed to have appeared in the wood which fringes the river, in whose waters the goddess and her nymphs were bathing. The terrified dryads close round DIANA, who, indignant and defiant, stands, scorn expressed by her features and attitude. The crescent on her forehead marks her out from her surrounding attendants. Most beautiful are the figures kneeling in the foreground. Two on the left endeavour to veil DIANA'S exquisite form by drapery, which in reality serves as a *repoussoir*, whereby the faultless symmetry of her figure and the marvellous roundness of her limbs are made manifest. One still in the water, somewhat on the principle of the ostrich when he buries his head in the sand and believes that his pursuers cannot see him, covers her face by her arm. Three young maids crouch in the rear, sheltering their own lovely forms behind that of ARTEMIS. Light falls *en masse* from the left on the central group, while the nymphs behind the goddess are in half light. The winding river catches a gleam which turns a streamlet trickling from a rock to silver. At the Salon of this year, M. LEFEBVRE exhibited *Psyché*, now on its passage across the Atlantic to its future home in Philadelphia. The ideal the master defined on canvas is that of a human soul who has triumphed over temptation by her own simple purity, represented by a young maiden seated on a rock washed at its base by the waters of the Styx. A serpent is coiled on the shore, but does not approach the beautiful virgin; a star shines from above her forehead, and faintly illumines the scene. CHARON has not yet appeared to take her across, and restore her to earth victorious over the evil to which the jealousy of VENUS had exposed her.

We have now briefly noticed some of the works by which the artist has recorded his power of rendering on canvas the human form in all the chaste purity and divine beauty of its origin. A few words as regards M. LEFEBVRE as a host may have interest. His house, 35 Rue la Bruyère, resembles one of our London houses, inasmuch as its master is its proprietor; therefore it is not divided into separate habitations in *étages*, as is the common usage in Paris. The walls of the staircase are covered by original drawings, sketches, designs, &c. Among these life-size reproductions in black and white of BENOZZO GOZZOLI'S inlaid effigies of knights on horseback are noteworthy, inasmuch as M. LEFEBVRE copied these in the cathedral at Sienna from the originals incrusting in its floor. As one enters the *atelier* M. WALTNER'S *aqua forte* of GAINSBOROUGH'S *Blue Boy*, exhibited at this year's Salon, catches the eye. The easel at present bears a canvas whence *Morning Rises from the Sea*, as yet only *en ébauche*, still fresh, graceful, and pure. M. JULES LEFEBVRE has attained middle life. Tall, and of commanding presence, his fresh complexion, pleasant smile, and cheery voice, convey the impression of a man who has proved victorious in the battle of life, and who thoroughly enjoys his success. He makes his visitor feel at home at once, and with genial kindness will "talk shop." RAPHAEL and CORREGGIO are the masters whose works most powerfully influenced his mind during his five years' residence in Italy. "But what," he says, "surprised him at first on arriving in Rome, even more than the magnificent works of their genius, was the difference in the atmosphere, in the climate, in the inhabitants, to his past experience. Nature assumes a garb there in which I had never seen her." To study her in every phase, he believes, is more important to an artist even than her reproduction by even the master-minds of the past. From the study of nature to turn to their interpretation of her, is of real service to a student. Speaking of his own students he once said to us: "Artists are in these latter times trained on different lines to those followed in the Early Italian period. The students who crowded the *bottegas* of the BELINI, of MANTEGNA, of PERUGINI, lived in daily communication with their master. Wherever RAPHAEL moved, his

disciples followed him. Thus they imbibed his tone of thought as well as acquired his technique. Such training was possible then; life was more simple. M. BOULANGER and I have an *atelier* where some hundred odd students come to us for instruction. ROCHEGROSSE, whose *Andromaque* won Le Prix du Salon; TATTEGRAIN, who exhibited *Les Duellants*; RENOUF, who painted the *Wave*; SERGENT, HAWKINS, are among our pupils. As you will remark, each has his own idiosyncrasy. We do not desire to form a school. We wish to leave to each his individuality; but it was not so in the Florentine *bottegas*." In reply to an inquiry as to the lovely ascending form of *Aurora Kissed by a Zephyr* on the canvas to which we alluded, M. LEFEBVRE said: "I cannot tell you what that future will be. My idea changes many times before it fructifies into complete expression. I believe she will rise from the water, as it were, on the mists of early dawn." The figure, be it remarked, is marvellous as now painted, on account of the foreshortening from the waist upwards, in consequence of its ascending movement. *En passant*, M. LEFEBVRE spoke with reverence and appreciation of our National Gallery, and of the "science" which Mr. BURTON had manifested in the arrangement and classification of its pictures. He paid a passing tribute to GUSTAVE DORÉ's memory: "Ah! il était mon ami, c'était un vrai artiste." On an easel opposite to us was a portrait of the Inspector-General of the Ponts et Chaussées, the habit of command very clearly given, and with this a certain haughtiness intensified by the Roman character of the features. "I constantly paint portraits in order to study nature at the fountain head. It is the study of nature alone which enables a man to idealise," remarked M. LEFEBVRE. He showed a photograph of *Fiammetta*, purchased by the Emperor of AUSTRIA. She was daughter, he said, of ROBERT of Naples, remarkable even among the VITTORIA COLONNAS and BIANCA D'ESTES of her time for learning and genius. "I selected her," he added, "to paint, as contrasting her type with that of *Ondine*," pointing to a lovely creation of his poetic fancy. The water *naïade* stands almost up to her knees in the clearest water, which by no means conceals her feet; her right hand is raised over her head to gather the moss which *tapisse* the rock against which her supple form rests. Her left hand grasps a tail of her golden *chevelure*, wet with the spray of trickling water. Full light falls on part of her beautiful form, while the rest is in soft shadow. She looks at you with deep, serious eyes; the curves of her half-smiling lips are exquisite. Cool breezes cause the water surface to ripple. The picture conveys the sentiment of repose.

Mr. VANDERBILT asked M. LEFEBVRE to paint a subject to fill a given space in his New York mansion, requesting that there should be five figures in the composition, and leaving the price of the work to the discretion of its author. Under these pleasant conditions M. LEFEBVRE, *con amore*, painted *La Fiancée*. The bride, sculpturesque as are Greek maidens, attired in her *chiton*, is seated on an antique chair; an attendant, as beautiful as herself, arranges her veil; her sister kneels before her, looking sorrowfully at her bridal adornments; while two younger children, the one holding her hands behind her, watch the scene at the door of the chamber. The scene takes place in Athens, and is of the PERICLES period. Useless is it to remark that every accessory is strictly correct. The tripod on the right is drawn from one now in the Louvre. The individual beauty of the girls' features as well as figures, the exceeding purity of their type, is what is most striking in the photograph, which, however good, never conveys an idea of painter's work.

A charming child of some seven summers, drawn in profile *caiffé* with a KATE GREENAWAY red bonnet, and standing against a *vert d'eau fond*, occupies the post of honour in the very centre of the studio. The child has features of exceeding refinement. The artist has lingered over the delineation of those cherry lips, of that delicately-arched nostril, and of those deep dreamy eyes, with more than ordinary carefulness. The face is almost painted in miniature, yet it is life-size. To the cloak the artist gave scant attention, simply sketching its outline on the canvas, which chanced to be gray. We inquired who this young person might be. "C'est ma fille," replied the father.

**Battersea Bridge** has been declared to be in a condition that renders it unsafe for vehicular traffic, and it is to be open for foot passengers only.

## STUDIES OF SOME LONDON CHURCHES.

(Continued from page 50.)

THE Church of *St. Matthew*, near the Brixton Station, is one of those buildings erected about the same time as *St. Pancras*, Euston Road, when Grecian architecture was the rage. The architect was PORDEN, who carried the work out in 1824 at a cost of 22,000*l*. The style is Doric, and externally the structure is of freestone throughout, and, according to BRAYLEY, "ranks with the best Classical buildings in that (*i.e.* Grecian) style." According to the taste of the present day, there is little to admire in it, while it is, moreover, internally very unchurch-like. The best part is the coloured decoration, which has been effected of late years. It seems curious that a church which cost so much should now be so little known, but its style, as has been said, is not fashionable.

The next church to be commented upon, *St. James's*, Bermondsey, is also Grecian in style, but of the Ionic order, and erected five years later than the building just mentioned. It is plainer, constructed of brick, freestone being only employed for the dressings. The best thing about the exterior is the spire. Entering the church, the effect is good, as there is plenty of height. But a great desideratum is painted glass or some decorative colouring, to take off the chill appearance. There is a flat and deeply-coffered ceiling divided into square compartments, with bold-panelled beams forming it into bays. The nave is of good width, and the galleries treated constructionally, the columns which support them resting on square-moulded piers. But, unfortunately, the gallery front is bellied out (there can be no better term than this to express the meaning, as every architectural tyro knows what is meant by a double-bellied baluster) in so remarkable a manner that the base-mouldings of the upper range of columns, level with the gallery front, die into it instead of standing free, as they ought to do. The chancel is nothing more than a recess opened into by a semicircular arch. It would certainly by no means injure the design if a properly arranged constructional chancel were added.

In *Allhallows*, London Wall, is an example of a church built during that dead era, as far as church feeling is concerned, the eighteenth century. For it was erected in 1767 from the designs of G. DANCE, jun. There are no side galleries, and the building is of fair proportions, but, as might be expected, destitute of a constructional chancel. No east window exists, but a kind of apse concha recess, which has some very tame-looking panelling to it. Pilasters supporting the arched ribs of the semicircular lath-and-plaster ceiling of the nave divide the composition into bays. External light is admitted in the ordinary and clumsy mode of the churches built not only at this date, but in WREN's time and by his school—*i.e.* a piece is cut out of the barrel ceiling and a window squeezed into it. How much inferior this device is to the mediæval method adopted in groining has been commented on before in these "Studies." The decoration to the ceiling consists of *appliqué* ornamentation. The large space of plain wall under the windows has its sameness broken by several monumental tablets. For a few moments let us take this church as a text, and from it deduce a lesson. As a piece of architecture it is almost more interesting than the Sistine Chapel at Rome, which, of course, depends entirely on its paintings by MICHAEL ANGELO. Were *Allhallows* properly glazed with grisaille or painted glass, a mellow light from above would fall on the interior. The representation of Our LORD in majesty might be painted in distemper or executed in mosaic, while some simple subjects from the sacred writings might be depicted on the nave ceiling. If the choir were raised slightly, so as to make a proper chancel arrangement, now wanting, with a chancel screen, as at a neighbouring church, the effect would be good. The west gallery might serve as an organ-loft, the church being so small that no inconvenience would be caused by the distance between the choir and the organ; in fact, in a short church no better place for sound could be found for the instrument. Mr. POPPLEWELL PULLAN (no mean authority on the subject) has expressed the opinion that these City churches might be made quite beautiful by the aid of colour. The Rev. EDWARD CUTTS also, in a paper read before the Institute of Architects some years since (to which the writer has before referred and commented on in these columns), ably expatiated on this view of the subject at a time when colour was far more rare than now in ecclesiastical architecture. People were then dread-

fully afraid that the attempt was being insidiously made to drive in the thin end of the wedge, make a series of Saint Chapelles in old England, and ultimately Romanise us all. Happily we can afford to smile at this chimera. It is pleasant to see how, in churches where evangelical views are held, that precious gift of God to man, the art of bringing colour as a handmaid to architecture, has progressed. When entrusted to able hands the bare walls have commenced to glow with colour and imagery, perhaps with angelic figures, banishing the dull tones of heaviness, and lighting up the temples of the Almighty with one of the most appropriate offerings it is possible to render to Him. Last, not least, low open benches might fitly take the place of the present pews, which are not the fine dark ones such as are found in some of WREN'S churches, but quite modern.

Not far off may be noticed the *Church of SS. Augustine and Faith*, almost under the great shadow of St. Paul's. This structure was considerably altered not long since; though the south and west galleries have been removed (only the small one on the north side being left), scarcely any space for worshippers has been lost, as almost an equal amount has been gained by throwing a large west lobby into the body of the church. Nevertheless, some degree of that dignity—so impressive in City churches—must have been lost by the abolition of the vestibule, a feature as characteristic of Wrenian churches as the galleries. It is a grave question whether, architecturally, these buildings benefit by "modern innovations." It is true that the rearrangement of churches of the type of the last-mentioned has been advocated; but there is a difference of nearly a century between the erection of SS. Augustine and Faith, and of Allhallows, London Wall. It is difficult, too, in the nineteenth century, to feel quite so conservative about buildings put up almost within the memory of man, as compared with the productions of WREN. It is curious to inquire whether the men of the twentieth century will have affectionate solicitude for the church architecture of the eighteenth, so decried by the present generation, when the fashionable styles of to-day will perhaps be thought beneath contempt. There is another church designed by WREN a stone's throw off, as yet unrestored, with high dark oak pews. It is believed that no such oak pews existed at SS. Augustine and Faith previous to the recent works, though there is little doubt that such were there in previous years, but swept away by the ignorance of former authorities. Low open benches, however handsome and appropriately designed in character with the churches in which they are placed, do not satisfy one's notion of the fitness of things. It is difficult likewise to admire the painting of an old oak reredos a kind of chocolate oak tint, though the gilding and the tempera colouring of scriptural subjects, such as the Ascension, are far more appropriate decorations to the east end of a church than the printed Creed, Lord's Prayer, and Commandments. It is, and always will be, a crucial point as each generation succeeds another, to know how to begin and where to stop in alterations, innovations, or adaptations to old buildings to meet the requirements of the times. No two men, even though experts, will be perfectly agreed on a matter which must necessarily depend upon individual niceties of taste and feeling. It is only possible to lay down broad general rules, elastic to a limited extent, and even then it is difficult to know who are the proper authorities on delicate points. Now it appears to the writer—to instance but one example of what is right in such cases—that the retention of the framework and main design of reredoses erected some 200 years ago, when ideas in ecclesiastical architectural decoration were very different to the present day, is as much as can be conceded to archæological principles. The substitution of the thought and pencilling of the devout artist in lieu of sentences stuck up like notice boards—very suitable when prayer books and Bibles were scarce and expensive—is a vast improvement. The illustrated and picture advertisements in the streets are really more decorative! However one may reverence the inspired words of Holy Writ, or the Apostles' Creed, the printing them up in our churches at the present day is an anachronism. Returning to the Church of SS. Augustine and Faith, the cathedral glass tints and patterns of the new glazing are rather too conspicuous and bright to please; they are out of tone with the church—too "fussy"—and something of a quieter character would have been more suitable. But we are quite right to avail ourselves of that beautiful material (cathedral rolled glass), which WREN would doubtless have used had he had the chance. It is to be regretted

that instead of metal standards to the altar rail, twisted oak balusters of the old Wrenian character had not been used. It is a question whether the moderns have the advantage over the seventeenth-century men in this respect. At the risk of being hypercritical, it must be said that the brass gaseliers are rather too Gothic in feeling, and if less demonstrative would have been more effective.

Some alterations, comparatively recent, have been made to the *Church of St. James's*, Piccadilly. The west vestibule has been thrown into the body of the building, and now forms a baptistery, which is better, architecturally speaking, than blocking up this spare area with fixed benches. The accommodation afforded by the galleries could not, of course, be spared in a church situated in such a thickly-populated parish in the very heart of London, where the rectory is generally supposed to be the stepping-stone to a bishopric. If the galleries were taken down the architectural character would be much altered, for their fronts in effect form an entablature on which a second order is mounted. The manner in which a semicircular arch is turned from pier to pier is pleasing. This has a better appearance than that often adopted by Sir CHRISTOPHER WREN in other churches, where the pseudo-clerestory window is cut out of the nave ceiling, and there is a plain flat one to the galleries. On the other hand, the long lintel looks weak, if one did not know that this lintel was all timber work covered with lath and plaster. It is much to be hoped that at no distant date the fine ceiling of the nave may be properly decorated in colour; it now looks very cold. The semicircular ceiling, walls, and gallery front are all one expanse of white. The pews, of moderate height, remain as in times past, and do not cry for change.

The unfinished *Church of St. Michael*, Woolwich, has a noble vaulted chancel, forming an admirable instalment of the building hereafter to be erected. There is, however, a small matter of detail in the flooring which might have been better managed. The site was limited in length, and it was much desired to well elevate the altar. In order to get over this difficulty steps rather higher than usual in such instances were designed. What is the consequence? The scale of a really lofty interior is diminished, and the ascent to the kneeling step made more difficult for elderly or infirm communicants. The architect has adopted a feature not often seen in modern work, but which is sometimes helpful. Shaft has been set over shaft in the east window. There is mediæval precedent for this in the nave of Romsey Abbey Church, and in other ancient examples.

(To be continued.)

## PARIS NOTES.

THE competition for the Prix de Rome section of painting has resulted in the victory of M. Marcel Baschet, a youthful pupil (he is not twenty-one years of age) of MM. Boulanger and J. Lefebvre, who carries off the grand prize. To M. Friant, born in 1865, and a pupil of M. Cabanel, and to M. Lambert, aged twenty-nine, who has studied under MM. Cabanel, Bin, and Lequien, have fallen respectively the first and second "Deuxièmes Grands Prix." As already announced in *The Architect*, the subject selected this year was *Œdipus Cursing his Son Polynices in the Presence of his Daughters Ismene and Antigone*. Out of the ten aspirants admitted to take part in the final stage of the competition, six were pupils of M. Cabanel. The general impression produced by the works, as a whole, was unfavourable, the critic, who inspected them when exhibited at the Ecole des Beaux-Arts last week, seeming to consider them below the average. A few, however, undoubtedly show considerable talent, and little fault can be found with the decision of the jury. The grouping of the figures in M. Baschet's picture is excellent, the colouring rich and warm. The sightless Œdipus stands erect in a dignified attitude, clasping one daughter to his breast with his left arm, while the right emphasises the malediction hurled at his son. Polynices cowers beneath the curse, whilst his remaining sister has sunk overcome at her father's feet. Altogether M. Baschet has grasped the spirit of his theme, which he has handled in a manner that augurs well.

In the sculpture section of the same competition M. Lombard, a pupil of M. Cavelier, and "Second Grand Prix" last year, has taken the Grand Prix. The first "Second Prix" has fallen to M. Puech, a pupil of MM. Jouffroy, Falguères, and Chapu, who carried off the second "Second Prix" in 1881, while M. Verlet, a pupil of M.

Cavelier, takes the third place in the list of honours, the present being the first occasion on which he has received a prize. The subject this year, it will be remembered, was a passage from the "Anarcharsis," describing the *Death of Diagoras*. He has just witnessed the triumph of his two sons in the Olympic games, and, crowned with the wreath they have won, is being carried among the applauding spectators, who shout, "Die, Diagoras, there is nothing left for you to covet!"

In the Architectural Section the ten competitors have just quitted their *loges*, after no less than 110 days' work. The subject given was "A Necropolis to contain the Sepulchre of the Founder of a great State, together with those of his Successors and eminent men who have rendered great services to their Country." The following are the names of the young architects engaged, in the order of their admittance to *loges*: (1) Redon, pupil of M. André; (2) Quatesons, pupil of M. Pascal; (3) Gonvers, pupil of M. Guadet; (4) Bergon, pupil of MM. Vandremere and Rollin; (5) Zobel, pupil of MM. Zobel and André; (6) Fontenelle, pupil of MM. Moyaux and André; (7) Devienne, pupil of MM. Coquart and Guérard; (8) Legrand, pupil of M. Pascal; 9. Maillard, pupil of M. Guadet; (10) Defrasse, pupil of M. André. Their work is being exhibited at the Ecole des Beaux-Arts during the last four days of the present week, and the definitive judgment will be delivered this day (Saturday).

Important works are at present being carried out for the enlargement and consolidation of the French Ministry of the Interior. The buildings now occupied by this Ministry are decidedly the most incomplete and badly-organised of all the Government offices. Not only is the numerous staff sadly cramped and crowded into flow, dark, and badly-ventilated rooms, but, owing to want of space in the Place Beauveau, some of the many services attached to the department are scattered about in different quarters of the city—in the Rue de Bellechasse, Rue de Grenelle-Saint-Germain, Rue de l'Université, &c. In order to put an end to this state of things, four large houses situate in the Rue Cambacérès, and another in the Rue des Saussaies, have been expropriated by the State, and are now being incorporated in the department. Although these buildings are not to be pulled down, their internal arrangement is being entirely altered. Communications with the central office, close by in the Place Beauveau, will be established by means of underground galleries. The work is expected to require nearly six months for completion.

A meeting of the managing committees of the various workmen's Chambres Syndicales was held last Monday at the Salle Harel to determine what trades should be officially represented at the Amsterdam exhibition. It was decided that sixty different trades should send delegates, and the total number of the latter was fixed at seventy, to several of the corporations—that of the bronze-workers, for instance—being accorded the right of having two representatives. A list of the elected delegates has been sent into the offices of the Municipal Council for approval, that body, it may be remembered, having voted a sum of 35,000 frs. towards their expenses. This sum will give about 30 frs. per head, a very fair allowance, considering the comparatively inexpensive nature of the journey, and that special arrangements are to be made in Amsterdam for the economical accommodation of these favoured representatives of French industry.

M. Alphand, the Paris Commissioner of Works, has ordered the adoption of the following measures for the improved cleansing of the city drains. A system of sluices is to be established by means of tanks containing 10 cubic mètres of water placed along the top of the drains at distances of 280 yards. The whole of these reservoirs will empty themselves instantaneously in the course of the twenty-four hours, gangs of men following each sluice with a view of sending down any matters that may still remain after the passage of the water. The length of the drains, to which this method of cleansing is to be applied, exceeds 265 miles. The central system of collectors is to be completed in order to relieve those in Clichy and Montmartre districts, which are now overcharged, and a total volume of 400,000 cubic mètres per day is to be provided for. Finally, the Government will be called upon to take measures against the filtration of the impure drainage water into the Rivers Seine and Marne throughout the departments of the Seine and the Seine-et-Oise. In addition to these measures, a committee has been appointed to study and report upon the best method of deodorising the drain water.

A new instrument, the "chrono-tachymètre," invented by

M. Louis Pouget, an officer of the Legion of Honour, for registering the speed of trains, appears likely to be adopted by all the great French railway companies. The apparatus has been submitted to severe tests, and is found accurately to perform its functions by following the movement of one of the wheels and printing the results on a scroll of paper.

On the front of No. 9 Rue Soufflot, a white marble slab has just been placed bearing an inscription: "The walls of the City of Paris, built during the reign of Philip-Augustus, about the year 1200. Site of the Porte Saint-Jacques." A representation of the gate is also on the slab.

Under the lately-proved will of Madame Laboulbène the Académie des Beaux-Arts received the sum of 70,000 frs., the revenue of which is to be divided each year among the ten young artists admitted to enter *loges* for the Prix de Rome in the section of painting. This year's competitors will, under this legacy, receive the sum of about 10½ apiece.

The demolition of the Tuileries ruins is entering upon its last phase. The Pavillon de l'Horloge, the work of Philibert Delorme, has been attacked this week, and a fortnight hence this last remaining fragment of the palace will have disappeared. It is expected that the clearing of the site will take another five or six weeks, so that October will be near before the work of excavation of the cellars and other underground portions of the building can be undertaken. Considerable curiosity exists as to whether any of the treasure reported to be buried under the old Palais des Tuileries will be found.

### THE ASHBURNHAM MANUSCRIPTS.

MR. E. J. POYNTER, in a letter to the *Times*, writes:—Is it too late, now at the eleventh hour, to make another appeal against the decision of the Government in the matter of the Ashburnham Manuscripts?

The English portion of the collection—that part, that is, which bears on English history—has required no advocacy to determine that its national home should be the great English library; it has been taken for granted that no Government could venture to refuse such an acquisition, and there has apparently been no hesitation in coming to an agreement on the concession made by Lord Ashburnham in dividing his collection.

But it is probable that the extraordinary artistic value of that portion of the collection called the Appendix, which contains, with one or two exceptions, all the illuminated books, is less widely appreciated than it ought to be. The selection from these books which has been for some time and is still on view at the British Museum, has naturally been visited by but a limited number of persons, many of whom were artists, and others who, like myself, were amazed at the wealth of beautiful design and exquisite workmanship revealed to them; but there were also, doubtless, many who were stimulated only by curiosity in a subject which was for a short time the talk of the day, and who can scarcely be considered as deeply interested. Some even may have gone with a preconceived conviction that admiration for these works is an idle taste, which it is not the business of Governments to encourage when they have so many better ways of spending money; and it is doubtless one of the difficulties attending any attempt to urge expenditure on works of art that their value is not demonstrable, while the claims of documents are easily argued. As a matter of fact, however, it is of less importance to possess the originals of State papers and historical documents which can be copied and printed, than to secure and retain for the nation treasures of art and skill, of which no reproduction can give more than a faint impression.

Yet, among the Italian illuminated books alone are two which would be worth securing at any price, even if they were offered to us from abroad. That the enthusiasm of an English collector should have already brought them into this country would seem an additional reason for securing them a permanent place in the national collection. The first, a series of pictures of the fourteenth century illustrating the life of Christ, is a treasure of design hardly less valuable in the history of art than the well-known series by Giotto in the Arena Chapel at Padua. Painted by an unknown artist, they have all the grandeur of style to be found in the great fresco painters of the time, with an original treatment, which shows independent observation of nature and abandonment of tradition. The other is the unique Albani manuscript, which is rendered famous by the full-page miniatures by artists of historical fame—Aspertini, Lorenzo di Credi, Francia, and Pietro Perugino. These miniatures, perhaps, were an uncongenial task to the painters who were in the habit of doing works on a larger scale; for, although the *Annunciation*, by Lorenzo di Credi, looks like the work of a hand not unaccustomed to the delicacy of illuminated work, that of Amico Aspertini is the only one which is fully worthy of a painter

of reputation, while the one by Francia is decidedly bad; but any shortcomings in the designs which give the book its historical value are fully made up for by the numerous exquisite paintings by an unknown hand which adorn the calendar at the beginning of the book and are scattered through the text. One half-length figure of Santa Lucia will remain fixed in the mind of any artist who has seen it as a gem of unrivalled beauty. I may name yet a third book in the style of Attavante, which is a work of skill and beauty and fanciful design, such as could only be produced in Florence and at the culmination of the art of the quattro cento period.

Three English books stand out, perhaps, in equal prominence; one of the fifteenth century being, probably, unique for the finish and beauty with which the subjects are executed, and showing that an independent school of great distinction existed at that time in England. But a critical catalogue of the books would be out of place. I mention these as masterpieces probably unrivalled, except by one book of Hours, a miracle of art, in the same collection, but which, being, unfortunately, among the Libri manuscripts, the Government are pledged not to buy for the museum. What I have said is sufficient to indicate the artistic value and historical interest of the collection.

It is obviously impossible to get up a popular excitement on such a subject as this. It is one which necessarily interests a limited class—more limited, perhaps, than, with our boast of artistic culture, we like to admit—and I will not stop to argue that this limited class is, perhaps, the one which deserves most consideration in these matters. But there is a point to which I should like to draw the attention of the general public, and through it, perhaps, of the Government or Treasury officials who dispose of these questions for us; and that is, that the treasures which past generations of enlightened and cultivated Englishmen have brought into this country, and which, through the nature of things, have been only partially accessible even to the most interested connoisseurs, are now from time to time coming into the open market; and that there is therefore now an opportunity for public spirit to appropriate for the elevation of public taste what private enterprise gathered in for the gratification of individual taste. The present opportunity is in some respects unique, and the price asked—45,000*l.*—the same amount as is proposed for the Stow portion of the collection, appears not to be excessive, and not above what could be obtained for the Appendix in the auction-room. Be this as it may, I am inclined to hold with the distinguished French critic, M. Oliver Rayet, that “un musée ne doit pas hésiter à payer, même trop cher, les objets hors ligne,” always supposing, that is, that they cannot be obtained for less.

It is impossible to forget to mention only one instance, the dispersion of the Meyrick collection of armour, in itself almost a national museum, offered to the Government for a sum so small that one suit alone, it is said, was afterwards sold for a nearly equivalent amount. The Hamilton manuscripts were not even offered to the Government, probably because there was no chance of any offer being entertained; so that the invaluable Botticelli illustrations to Dante left this country to be straight caught up by the more enlightened dispensation at Berlin—the whole library being bought probably for the sake of this one unique book. Indeed, if all the collections worth having which have been offered to the Government within the last twenty years had been bought, the addition to the national expenditure would have been hardly appreciable; and who regrets the 70,000*l.* which were spent on the Peel collection for the National Gallery, one of the rare instances in which the Government of the day took advantage of an offer?

### THE PROTECTION OF THE MONUMENTS OF CAIRO.

**A**MONG the minor questions which Lord Dufferin has wisely included in his general revision of Egyptian affairs, the protection of the monuments of Cairo deservedly holds a prominent position. It is known, says a writer in the *Times*, that His Excellency has already suggested to the Khedive's Government a scheme for their better preservation, and that the scheme will probably embrace alike the ancient monuments of the Nile valley and the Mediaeval architecture of Cairo. This comprehensive view is clearly the simplest and wisest mode of dealing with the historical and artistic interests of Egypt; but it is the first time that the Arab monuments have been held worthy of a place beside the remains of ancient Egyptian art. The monuments of the Pharaohs and Ptolemies have naturally excited the greater interest, and have been proportionately better cared for. Till late years, however, this care has been altogether inadequate. Tourists have been suffered to chip off pieces of inscriptions and statues, and to blacken the sculptured walls of tombs with their ruthless candles and torches; and even the leading explorers and scholars have joined in the work of spoliation, and thought more of enriching the museums of their own countries than of the lamentable gaps they left in Egypt itself. Even now, though M. Maspero is as vigilant and single-minded as could be desired, his staff and his powers are not sufficient adequately to control the vandalism of travellers.

To lovers of the ancient monuments, therefore, Lord Dufferin's proposal of an archæological police will be very welcome. But to students of Arab art his reforms will seem even more important. The mediaeval buildings of Cairo have in recent times suffered infinitely worse treatment than the ancient temples and tombs. They are built, and often very badly built, of perishable materials; some of their finest decoration is in stucco and wood, while that of ancient Egypt is carved in limestone and granite. Thus with Arab art the agency of natural decay was added to the neglect and wanton destruction of man. Nothing but constant and skilful repairs could have preserved the monuments of Cairo in their original perfection, though it may be doubted whether any skill could have resisted the action of time upon many of their most beautiful and delicate decorations. The attempt, however, was not made, for the funds with which they were endowed by their pious founders were confiscated early in this century by Mohammed Ali, and since then no one has shown himself inclined to keep up at his own expense monuments which were dedicated to the memory of some one else. It is very probable that the endowments were misappropriated before their confiscation by Mohammed Ali, and it is certain that the present deplorable condition of most of the mosques presupposes centuries of neglect and indifference. The pious zeal or personal vanity which prompted their erection evidently died with their founders, and subsequent generations preferred building new monuments in their own honour to preserving those which were erected in honour of their ancestors. It is the way with all Eastern architectural ambition. Whatever the cause of the present state of the monuments of Cairo, the result is the same. Whatever is to be done now will be done at least a century too late. It is now impossible to restore the mosques and the other exquisite vestiges of the Mameluke era to their pristine beauty, and most of the rich decoration of the interiors is gone for ever. They have been allowed to travel too far on the road to destruction. All that can now be done is to preserve them in their present condition as long as possible with the help of every resource of science; to repair such portions as admit of being repaired, while allowing no rash restoration; and to copy, cast, squeeze, photograph, and survey them while they yet stand, and thus preserve their plans and decorations in some form or another before the originals, in the natural course of things, built for a time and not for ever, gradually decay and disappear. If Lord Dufferin can attain this much he will have performed an immense service to art. When it is stated that there are now in Cairo 315 large mosques, 191 chapels, 294 sacred tombs, 200 *sebilis*, or fountains, 35 mosque schools, and 18 hospices, to say nothing of the noble monuments comprised in the extra mural cemeteries of Kaït Bey and the Kerâfeh (called by Europeans “Tombs of the Khalifs” and “Tombs of the Mamelukes”); that these thousand monuments represent what is vaguely termed Arab art in its purest form, free alike from the excessive elaboration of Alhambra, and from the grotesque forms and ornamentation of India; that they trace the history of this purest form of Arab art from its early phase (omitting the nondescript mosque of Amr) under Ibn Tulûn in the ninth century of our era, through the characteristic epochs of the Fatimite Khalifs and of Saladin, to the golden age of the Mameluke Sultans and the prince of Cairene builders, Kaït Bey, in the fifteenth century, and then through its gradual decay, under Turkish rule, to the monstrosities of the present century—it will be realised that the preservation of so continuous a series of monuments must be an unspeakable gain to students of art. How beautiful and unique these monuments are those who have visited Cairo repeatedly and for long periods can alone fully appreciate. There is but one voice among artists and archæologists as to the imperative necessity of preserving them.

It is fair to say that this necessity has of late years been recognised by the Egyptian Government. A commission was appointed at the end of 1881 for the special purpose of protecting these monuments, and it includes the names of such well-known admirers of Arab art as Rogers, Artin, and Franz Beys, and MM. Bourgoing and Baudry, besides the Minister of Vakoufs and other officials. Its work was interrupted, after a preliminary meeting, by the late troubles, but it has since resumed its functions with renewed zeal. There appears to be some misconception in England as to the character and work of this “Commission for the Preservation of the Arab Monuments of Cairo.” It has been insinuated that the Commission is not only inoperative, but that it is positively in league with the destroyers of monuments. Recent reports from Egypt, however, tend to show that such suspicions are wholly without foundation. The Commission is working hard, and working in a scientific and intelligent manner. It has appointed two sub-committees, one of which is intrusted with the task of drawing up a complete inventory of the Arab monuments (and has already registered between seven and eight hundred of them), while the other is instructed to visit the various mosques, tombs, fountains, &c., which, upon information received, appear to be most urgently in need of attention, to report upon their condition and recommend the proper steps to be taken for their preservation. Once a week this sub-committee makes an official tour of inspection, visits a series of monuments, decides whether they are capable of preservation or not, and in the former case

reports on the best means of preserving them. If a monument is so wholly ruined that preservation would be both useless and impossible, the Commission removes any fragments of tracery or mosaic, or other objects of interest that may be found among the ruins, to the new Museum of Arab Art, which is being formed in the eastern cloister of the mosque of El-Hâkim, where already a goodly collection of fine specimens of wood-carving, brass and silver-work, mosaics, tiles, enamelled glass lamps, bronze-plated doors, coloured glass and stucco windows, &c., has already been brought together. The recommendations of the sub-committee are not only sent in, but carried into effect; and, with a view to public criticism and surveillance, the reports are regularly published by Rogers Bey in the *Moniteur Egyptien*. Every monument which the sub-committee has decided to be worth preserving is forthwith in general committee declared an historical monument, and from that moment forward no power can touch it, no new road can be opened through it, and no surveyor can dock it to suit the prevailing notion of regulated street frontages. In accordance with the recommendations of the sub-committee, falling walls, arches, and towers are propped up with buttresses or beams, ruined gateways are repaired, modern encroachments on monuments are cleared away, and scattered fragments of ruined monuments are taken to the Museum of El-Hâkim. Not only are the known monuments cared for, but others previously unsuspected are discovered in the official tours of inspection. Only last month the sub-committee unearthed the family tomb of the Abbaside Khalifs of Egypt, and every inspection brings to light something novel and interesting to the student of Arab art and the history of mediæval Egypt. Whatever is thus discovered is at once recorded and described in the archives of the Commission; but while every precaution is taken to identify, preserve, and record the historical and artistic monuments of Cairo, no attempt is made at restoration. Those who know what restoration means in Cairo will appreciate at its full value this prudent reserve.

Here, then, we see at last the beginning of a proper treatment of the Arab monuments. Thanks chiefly to the energy, learning, and zeal of Rogers Bey, the Commission is working well and on the right lines. Lord Dufferin has here an instrument ready to his hand, and his efforts will doubtless be directed chiefly to strengthening the hands of the Commission. He is well aware that to be effectual the Commission needs to be furnished with additional powers. For example, it can declare a building an historical monument, and thereby protect it from all direct attacks; but its power does not extend to indirect aggression. Many mosques depend for support to some extent upon the surrounding houses, and the demolition of a house over which the Commission has no control may result in the destruction of the mosque. The prime agent in such demolitions is the present code of urban regulations, by which the width of streets is fixed at so many mètres, while a level frontage is required at the cost of every building that projects too far into the street. Whatever is supposed to interfere with the rapid passage of the two-horse open cabs with which Cairo is now infested must be swept away, according to the present tasteless system. The city is full of evidences of the havoc wrought by this *alignement* regulation, and if it is not immediately checked the injury done to many of the finest monuments will be irreparable. Lord Dufferin's first step should be to limit the power of the Minister of Works in the matter of this *tanzim*, or street straightening, and to give the Commission power to prevent indirect as well as direct injuries to the monuments. The members of the Commission need no instruction in the importance both of registering and of propping up, and otherwise preserving the Arab monuments; these are their chief aims at present, and they are pursuing them with success; but besides these there are other points to which their attention will probably be directed. One of these is the appointment of a trustworthy body of guardians for the monuments—an archaeological police, who, unlike the present *bou-wahbs*, should be above the influence of baksheesh at the hands of depredating travellers, and who should receive fixed salaries and charge fixed entrance fees, which should be self-registering. Another important point is proper representation of the monuments by means of surveys, drawings, photographs, casts, &c., while yet such preservation is possible, so that any monument could be accurately reproduced from the data thus recorded. A third point is the organisation of the Museum of Arab Art, and the appointment of a competent curator, who should be able to inaugurate a school of Arab design. It must be added, however, that, considering that the museum is quite in its infancy, the Commission has effected a great deal of admirable work in it in an amazingly short time.

One very serious consideration remains. The members of the Commission are for the most part busy men with enough official work to do without their honorary services on the Commission. If the powers and functions of the Commission are increased, it is not easy to see how the members can find time to exercise them. What is wanted is a body of men who can give their undivided attention to the work which has been so ably begun. Of all countries in the world Egypt would appear to be the one in which a Ministry of Fine Arts would be most obvious and appropriate, and there is no reason why the creation of such a department

should throw much additional expense on the Treasury. It would only be necessary to make the Director of Archæological Research and head of the Boulak Museum one and the same person with the Minister of Fine Arts, appoint an under-secretary for Arab art, and establish a competent staff of surveyors, inspectors, and clerks. By levying a fixed entrance fee on all visitors to public monuments, ancient and mediæval, the cost of administration would easily be repaid; real students of Egyptian and Arab art would gladly submit to the imposition of an extra charge, and tourists would be indifferent to a small increase in the national custom of baksheesh. A Ministry of Fine Arts, holding control over all the monuments of Egypt, would meet every requirement, provided the staff were mainly European and properly trained, and there are already enough students of ancient and mediæval Egyptian art to remove all doubt on that score. If such a Ministry does not form part of Lord Dufferin's scheme, it may at least be hoped that his scheme will lead up to it in the future.

### THE BRITISH ASSOCIATION.

THE arrangements for the meeting at Southport are nearly complete. The address of the President elect, Professor Cayley, will be delivered in the pavilion of the Winter Gardens, which is set apart for the use of the Association. Cambridge Hall is named as the reception-room, and the sectional meetings are appointed to be held in the Town Hall, Art Gallery, and other places not three hundred yards distant. The business will open on Wednesday, September 19, with the President's address. On the following day, besides the sectional work, there will be a soirée in the Winter Gardens. The next day (Friday) has for its special feature the address of Professor Ball, Astronomer-Royal for Ireland. Saturday afternoon is to be devoted to excursions to Lathom House, Knowsley, Ince Blundell Hall, and the Liverpool Docks. On the evening of this day Sir F. J. Bramwell is to give his lecture to working people. On the Monday following Professor M'Kendrick, of Glasgow University, will give the general lecture, and on Tuesday the second soirée is to be held, also at the Winter Gardens. The formal business closes with the general meeting on the afternoon of Wednesday. For Thursday excursions are proposed to Haigh Hall, the seat of the Earl of Crawford and Balcarres, the Wigan Coal and Iron Company's Works, Stonyhurst College, Whalley Abbey and Clitheroe, Furness Abbey, the Lake district, the glass and chemical works at St. Helens, and the Abram Colliery. The presidents of the working sections are as follows: Mathematical and physical science, Professor Henrici; chemical, Dr. J. H. Gladstone; geology, Professor W. C. Williamson; biology, Professor E. Ray Lankester; anthropology, Mr. W. Pengelly; geography, Lieutenant-Colonel H. H. Godwin-Austen; economic science and statistics, Mr. R. H. Inglis Palgrave; mechanical science, Mr. James Brunlees. Mr. Threlfall, of the Local Committee, has charge of the Mayor's special fund of 100*l.* for promoting the attendance of working men by enabling them to purchase the associate's ticket at half price. It has also been arranged that a portion of this amount shall be expended in bringing over working men to hear Sir Frederic Bramwell's address. Already in response to the Committee's invitation a large number of exhibits are promised for the soirées. This important division is under the superintendence of the Chevalier de Stoess and Mr. Alfred Morgan. Authors of memoirs are reminded that August 22 is the last day for sending in their papers to the general secretary.

### METROPOLITAN IMPROVEMENTS.

THE Metropolitan Board of Works on Tuesday arrived at some important resolutions in regard to the powers they will seek from Parliament in the next session. It has been unanimously determined to ask the sanction of the House of Commons for the construction of a low level bridge across the Thames immediately eastward of the Tower. Sir Joseph Bazalgette has been instructed to prepare designs for this undertaking, in substitution of the plans for a high level bridge, which he submitted some months ago. By a sufficient majority, also, it has been resolved to seek powers to construct two great tunnels under the River Thames, easily available for all kinds of traffic. The points selected for the construction of these important works are Shadwell and Blackwall, and the designs for them have been already completed by Sir Joseph Bazalgette. With regard to street improvements, the widening of Parliament Street is a work which the Metropolitan Board express their readiness to undertake on the lines laid down by Mr. Shaw Lefevre. The question of the improvement of the means of access to the New Law Courts stands over for further consideration. Of the eight or nine millions sterling estimated to be required for these great undertakings, the Metropolitan Board will ask for powers to raise about one-half by the indirect taxation afforded by an extension of the period of the coal and wine dues.

## NOTES AND COMMENTS.

THERE is some satisfaction in discovering that a judge of the High Court of Justice is capable of drawing erroneous conclusions when he goes outside his court, and is no more exempt from the fallacies which arise from "mal-observation" than the dumbest witness. Mr. Justice MATHEW lately opened the new Shirehall at Shrewsbury, which has been restored from the plans of Mr. LOCKWOOD, of Chester. His Lordship congratulated the county upon possessing a building so admirably adapted for the purpose for which it was intended, and which was a credit to the architect who designed it, and to the public spirit of the inhabitants. "There is only one respect," continued the learned judge, "in which what is new appears to me to be inferior to the old. The old courts in their internal arrangements were excessively inconvenient, but externally they were picturesque; and, speaking for myself, I fear I cannot apply that commendation to the new structure." It would seem that Mr. Justice MATHEW was giving expression to his own recollections of some picturesque thing he had seen, and which no longer existed. But, strange to say, the exterior which His Lordship condemned has stood in Shrewsbury since 1835, and it remains unaltered from the time when it was designed by Sir ROBERT SMIRKE. So remarkable an utterance may well be cited henceforth as an example of a fallacy of vision.

WHATEVER may be the condition of art in this country, it is a remarkable fact that every year there are more books and publications relating to art issued in the English language than in any other. Out of the 886 publications and books on art which appeared in Europe during last year, 311 were in English, 269 in German, and 237 in French. The remaining 49 publications represent the efforts of the Italians, Swedes, Danes, and Spaniards.

DOUAI appears to possess an excellent type of a technical school. There are, according to Mr. BOWLER, four classes. The first deals with carpentry. A plain piece of wood is put into the hands of the pupil, who is taught to chamfer it, to pierce it, to cut a second piece to fit into the first, to make mortice and tenon, scarings, door styles, and generally joinery, not artistic carving. In the second stone-cutting is taught, the first exercise being to incise lines, curves, volutes, letters, and so on, up to a mantelpiece. The third class is for iron work, and there is a complete forge with a steam-engine. The fourth class is chemical. The expenses of the school are divided between the City and the State.

THE English acting-consul has given a description of the kind of hut which has been adopted for housing the labourers who are employed on the Panama Canal. They consist simply of four wooden pillars, on which are laid cross-beams, forming a parallelogram. The skeleton of the roof is then built, and on it, in lieu of tiles or shathing, is a good roof of palm-leaves or other branches, which are just as serviceable as clay tiles or slates for keeping out damp, rain, and heat. The lower portion of the house is not inhabited, nor is there any floor laid on the ground; but this latter part of the structure is built on the summit of the four pillars, and the inmates climb up to their first floor by means of a ladder. The object of this rustic style of architecture is to prevent fevers and colds. This is a hygienic measure; the air circulates freely underneath the first floor, which does not come in contact with the earth when it rains. The temperature of roofs made with branches and leaves is invariably cool, owing to the non-conducting nature of the material used. This simple style of habitation has proved successful and keeps the labourers in good health.

A DECISION which was given by Mr. WATKIN WILLIAMS in a case tried this week in the Queen's Bench Division, somewhat modifies the accepted theory in regard to architects' certificates. A builder was employed to enlarge a house at Twickenham, and it was agreed that he was to be paid 75 per cent. of the work done on the production of the architect's certificates, and the balance when the final certificate was given. The owner was dissatisfied with some part of the work, and he informed the builder that he should not accept the final certificate unless something he required had been

done. The architect stated at the trial that it would not have been in his province to have withheld a certificate if the defendant had required him to do so. The judge directed the jury that, if they thought that the certificate had been withheld by the architect acting on his own judgment, the defendant would be entitled to their verdict; if, however, they thought that the withholding of the certificate was due to the improper interposition of the defendant, and that he prevented the architect from giving his certificate, they should find for the plaintiff. The jury returned a verdict for the plaintiff for the amount claimed.

AN English Commission has been formed in connection with the International Exhibition of the Graphic Arts in Vienna. Sir FREDERICK LEIGHTON is president; Mr. COUSINS, R.A., is vice-president of the section of engraving, and Mr. SAMUEL HADEN of the section of etching. All exhibits must be sent on or before August 15 to Mr. SMITH, printseller, 22 Mortimer Street, W., who will forward them free to Vienna.

THE Royal and Civil Engineers who represent England in India are, as a rule, noted for their indifference to architecture. The Earl of KIMBERLEY, in distributing the prizes at the Cooper's Hill College, suggested that more attention should be given by students to art. His Lordship said he should, indeed, be glad to hear that some of our civil engineers had become proficient in architecture, for though he did not make pretensions to judgment in such matters, he thought, in common with many others, that we suffered a good deal from the extreme ugliness of the erections by which we were surrounded, and by the want of architectural effect in the enormous towns continually being built. But if His Lordship turned his attention to India he would discover among the Government works structures which are far more ugly than the buildings in English towns.

IT was announced at a meeting of an antiquarian society in Dublin on Monday that the Government had purchased the Ashburnham Manuscripts. It was suggested that all the volumes of the collection, both in the Irish language and connected with the history and literature of Ireland, should be secured for an institution in Dublin, where they will be accessible to the public under proper regulations, the most suitable place being the Royal Irish Academy.

THE Metropolitan Board of Works seem to have approved of the project of the First Commissioner of Works for the improvement of Great George Street, Westminster. It is proposed to remove the whole of the houses between King Street and Delahay Street, and northward to Charles Street. There would then be four lines of frontage on which buildings of a high class might be erected. It is estimated that the property would cost 755,000*l.*, while the new frontage would be worth 755,000*l.* The Government already possess part of the property, worth 320,000*l.*, which will be exchanged for so much of the new frontages as may be worth that sum, on condition that the Government may have power to determine the character of the buildings that may hereafter face Parliament Street. In no district of London has there been more improvement during the last twenty years than in that part of Westminster, and the new project will leave little to be done.

THE meeting of the National Association of Master Builders was held in Edinburgh on Monday. Mr. BIRD, the president, in his address referred to the question of quantities and forms of tender, which had been fully discussed by the sub-committee at a meeting held some time ago at Birmingham. It was hoped, he said, they would have the matter satisfactorily discussed and dealt with along with the Royal Institute of British Architects next year, which was the fiftieth anniversary of that institution. According to Mr. BIRD, the question of quantities and of contracts is one of vital importance to builders in England, who suffer more than builders in Scotland, where, fortunately, they generally have ordained surveyors. Frequently the quantities taken out by architects in England were, he said, incompetently taken out and were insufficient, and the builders consequently suffered. The Association has now one hundred and seventeen local associations, twenty being in Scotland. The next meeting is to be held at Bradford.

## ILLUSTRATIONS.

## STAIRCASE DECORATION.

OUR illustration shows the decoration of a staircase with papers in a style appropriately simple and severe. It is one of the latest designs of Mr. LEWIS F. DAY, and is produced by Messrs. W. B. SIMPSON & SONS, of St. Martin's Lane, who have just issued a new pattern-book of papers, all of which have been designed by the same artist, and are executed in his own colourings.

## PRIVATE ASYLUM, NEAR HENLEY-IN-ARDEN.

THIS asylum, which was recently completed for Dr. S. H. AGAR, M.D., is, we believe, the only one which has been erected for private use for many years.

In nearly every case previously private asylums have been established in old houses altered to a greater or less extent to suit the new use to which they have been converted, and it has been reserved for Dr. AGAR, of Henley-in-Arden, to initiate a better policy by erecting a building carefully designed for its special purposes.

In preparing the plans the leading idea throughout has been that of a country-house of a suitable plan, specially arranged, and giving three distinct and separated apartments—viz., a suite of private apartments, one of ladies' and ladies' attendants' apartments, and one of gentlemen's and gentlemen's attendants' apartments—but all in one block, so that the administration and service might be as little laborious as possible. Anything in the nature of an institution has been avoided, but, at the same time, everything tending to the comfort, health, and safety of the patients has been as carefully kept in view.

The fronts of the house, which are shown in our illustration, are to the south and west. Rooms are provided for forty patients and their attendants, besides the private suite, which consists of a dining-room, drawing-room, study, bedrooms, and dressing-room.

A block, consisting of the stables, coach-house, and other outbuildings (not seen in the view), is to the north-east of the house, which stands in about thirteen acres of garden and other ground. The walls are all of local red and brown brick, with stone dressings; the roofs are covered with red Llanberis slates. The whole of the works have been carried out by Messrs. SMALLWOOD & Co., of Wootton, from the designs of Mr. W. HAWLEY LLOYD, architect, 79 Colmore Row, Birmingham.

## DESIGN FOR STRATFORD-UPON-AVON HOSPITAL.

IN this design accommodation is provided (on either side of the administrative department) for fifteen male and fifteen female patients, and a commodious waiting-hall and dispensary, drug-room, &c., are planned for the separate use of the out-patients. Owing to the smallness of the amount proposed to be expended on the building, it was necessary to keep the exterior as plain and unpretending as possible. Red facing bricks were proposed for the fronts, and Broseley tiles for the roofs. The building was estimated to cost (including entrance gates and palisading) the sum of 4,600*l*. Messrs. A. W. & A. G. CROSS, of 56 Chancery Lane, and Hastings, are the architects, by whom the drawings were prepared.

## SOUTH COTTAGES, NORBITON PARK ESTATE, SURREY.

THESE cottages have been erected on the estate at a cost of about 380*l*. a pair. They contain six rooms, scullery, water-closet, and coal cellar, separate entrances. The architect was Mr. T. LOCKWOOD HEWARD, 7 John Street, Bedford Row, W.C., and New Malden, Surrey. The whole of the work was carried out by Mr. HENRY THORN, builder, New Malden, Surrey.

## HOUSE AT LONG DITTON.

THIS house was lately completed from the designs of Mr. J. NIXON HORSFIELD, architect, of Surbiton.

## SCHOOLS AND MISSION CHAPEL, CLAUGHTON, BIRKENHEAD.

THE foundation-stone of the school and chapel at Cloughton, forming the subject of one of our illustrations, was laid in January last by Mr. W. LAIRD. In December 1881 the committee of the schools invited five architects to send in designs, and that by Mr. ALEXANDER BLEAKLEY, jun.,

A.R.I.B.A., was selected. The plan is somewhat of the form of the letter E, the infant school forming the central block, separating the boys' and girls' divisions. There are three principal rooms and nine class-rooms. One of the latter will be fitted up for a cookery class. The building is faced with Ruabon red bricks, the dressings being moulded red terracotta, and the roofs covered with brindled roofing tiles. The inside faces are of local machine-made bricks. The windows are glazed with rolled cathedral glass in lead lights, and fitted with hopper ventilators. The contractors for the buildings are Messrs. A. BLEAKLEY & SON, Birkenhead.

## ADDITIONS TO VILLA RESIDENCE, WESTOE, SOUTH SHIELDS.

THE villa partly shown in the illustration belongs to Mr. T. B. BARKER, and is situated on the south side at the entrance of Westoe village. The new wing has been built on the foundations of the old stable buildings, and contains a drawing-room, bedroom, and billiard-room, with lavatory, &c. The facings are of red bricks, with Carlisle stone dressings, and the roofs are covered with Broseley red tiles. The contractor was Mr. WM. N. HUDSON, and the architect, Mr. HENRY GRIEVES, of South Shields.

## PROPOSED ALTERATION IN THE HOUSE OF LORDS.

THE report has been published of the Select Committee of the House of Lords appointed "to consider the construction and accommodation of the House, including the galleries and rooms belonging thereto, more especially in reference to seating, hearing, and reporting; and whether any and what improvement therein can be made." The recommendations are as follows:—

1. The committee have met and examined several witnesses, and have considered the several matters referred to them.

2. With regard to the accommodation of the reporters, the committee are of opinion that the room now occupied by the reporters for transcribing is insufficient, and they recommend that a larger room should, if possible, be assigned to them by the proper authority.

3. The committee would have been glad to have recommended the extension of the reporters' gallery up to the side galleries, but it appears that there would be a serious difficulty in doing this, owing to the difference in the levels of the reporters' gallery and the side galleries. They recommend, however, that the ornamental uprights or pinnacles that rise above the desk on which the reporters write, and which interfere with the view and hearing, should be removed, and that the partitions and backs, or doors, to the front row of seats should be done away with, thus enlarging the space and getting rid of the noise occasioned by opening and shutting of the seats. Sitting room in the front row may thus be provided for twelve instead of ten.

4. The committee consider that the reporting would be facilitated if the officers of the House were directed to enforce order and silence more strictly at and beyond the bar.

5. The seats in the side galleries are extremely narrow and uncomfortable, and on nights when there is a large attendance the amount of accommodation is much short of what is needed. The committee think that an extension of the side galleries, giving 226 comfortable seats in place of 146 seats, many of which are cramped and uncomfortable, would be desirable, provided it can be done without injury to the architectural beauty of the House, and the wider galleries would probably improve the acoustic qualities of the House. In order to judge of the effect which a widening of the galleries would have on the appearance of the House, the committee recommend that the experiment should be tried by projecting (but not for occupation) the whole or a sufficient part of one of the galleries, taking care that the new work shall be made and coloured or toned so as exactly to correspond in colour, material, and shade with the present work.

6. The space between the peers' seats on the floor of the House is inconveniently narrow from back to front. The committee recommend that the table of the House should be reduced to the size of 6 feet 11 inches square, by which 6 inches will be added to the gangway on each side between the table and the front bench, and that the front bench be moved forward 6 inches on each side, and that the seats on each side be rearranged, using the space thus gained to widen the distance between the three front benches.

The committee further recommend that the lavatory accommodation be improved in the manner suggested by Mr. Scott, and that the changes suggested by him for hanging coats in the Peers' House lobby should be made.

8. The committee recommend, in the event of your lordships approving of the changes suggested, that the Deputy Lord Great Chamberlain should communicate with the First Commissioner of Works as to their execution.

9. The committee think that additional accommodation should be given to the department of the Lord Chancellor, and they understand that this accommodation could be obtained by agreement between the Lord Great Chamberlain and other officers of the House.

### MR. RUSKIN ON ART IN TOWNS.

A PREFACE has been written by Mr. Ruskin to a pamphlet containing two papers read by Mr. T. J. Horsfall, of Manchester, on "The Study of Beauty," and "Art in Large Towns." Mr. Ruskin says:—

"I have been asked by Mr. Horsfall to write a few words of introduction to the following papers. The trust is a frank one, for our friendship has been long and intimate enough to assure their author that my feelings, and even practical convictions in many respects differ from his, and in some, relating especially to the subjects here treated of, are even opposed to his; so that my private letters (which, to speak truth, he never attends to a word of) are little more than a series of exhortations to him to sing—once for all—the beautiful Cavalier ditty of 'Farewell, Manchester,' and pour the dew of his artistic benevolence on less recusant ground. Nevertheless, as assuredly he knows much more of his own town than I do, and as his mind is evidently made up to do the best he can for it, the only thing left for me to do is to help him all I can in the hard task he has set himself; or, if I can't help, at least to bear witness to the goodness of the seed he has set himself to sow among thorns. For indeed the principles on which he is working are altogether true and sound; and the definitions and defence of them in this pamphlet are among the most important pieces of art teaching which I have ever met with in recent English literature—in past art literature there cannot of course be anything parallel to them, since the difficulties to be met and mischiefs to be dealt with are wholly of to-day. And in all the practical suggestions and recommendations given in the following pages I not only concur, but am myself much aided as I read them, in the giving form to my own plans for the museum at Sheffield; nor do I doubt that they will at once commend themselves to every intelligent and candid reader. But, to my own mind, the statements of principle on which these recommendations are based are far the more valuable part of the writings, for these are true and serviceable for all time, and in all places; while in simplicity and lucidity they are far beyond any usually to be found in essays on art, and the political significance of the laws thus defined is really, I believe, here for the first time rightly grasped and illustrated. Of these, however, the one whose root is deepest and range widest will be denied by many readers, and doubted by others, so that it may be well to say a word or two further in its interpretation and defence—the saying, namely, at page 22, that 'faith cannot dwell in hideous towns,' and that 'familiarity with beauty is a most powerful aid to belief.' This is a curious saying, in front of the fact that the primary force of infidelity in the Renaissance times was its pursuit of carnal beauty, and that nowadays (at least so far as my own experience reaches) more faith may be found in the back streets of most cities than in the fine ones. Nevertheless, the saying is wholly true; first, because carnal beauty is not true beauty; secondly, because rightly judged, the fine streets of most modern towns are more hideous than the back ones; lastly, and this is a point on which I must enlarge, because universally the first condition to the believing there is order in heaven is the sight of order upon earth; order, that is to say, not the result of physical law, but of some spiritual power prevailing over it, as—to take instances from my own old and favourite subject—the ordering of the clouds in a beautiful sunset, which correspond to a painter's invention of them; or the ordering of the colours on a bird's wing, or of the radiations of a crystal of hoarfrost or of sapphire, concerning any of which matters, men, so called of science, are necessarily and for ever silent, because the distribution of colours in spectra and the relation of planes in crystals are final and causeless facts, orders, that is to say, not laws. And more than this, the infidel temper which is incapable of perceiving this spiritual beauty, has an instant and constant tendency to delight in the reverse of it, so that practically its investigation is always, by preference, of forms of death or disease; and every state of disorder and dissolution—the affectionate analysis of vice in modern novels being a part of the same science. And to keep to my own special field of study—the order of clouds—there is a grotesquely notable example of the connection between infidelity and the sense of ugliness in a paper in the last *Contemporary Review*, in which an able writer, who signs Vernon Lee, but whose personal view or purpose remains to the close of the essay inscrutable, has rendered with considerable acuteness and animation the course of a dialogue between one of the common modern men about town who are the parasites of their own cigars, and two more or less weak and foolish friends of hesitatingly adverse instincts; the three of them, however, practically assuming their own wisdom to be the highest yet attained by the human race; and their only diversion on the mountainous heights of it being by the aspect of a so-called 'preposterous' sunset, described in the

following terms: 'A brilliant light, which seemed to sink out of the landscape all its reds and yellows, and with them all life; bleaching the yellow cornfields and brown heath; but brandishing into demoniac energy of colour the pastures and oak woods, brilliant against the dark sky as if filled with green fire. Along the roadside the poppies, which an ordinary sunset makes flame, were quite extinguished, like burnt-out embers; the yellow hearts of the daisies were quite lost, merged into their shining white petals, and, striking against the windows of the old black-and-white chequered farm (a ghastly skeleton in this light), it made them not flare—nay, not redden in the faintest degree—but reflect a brilliant speck of white light. Everything was unsubstantial, yet not as in a mist; nay, rather substantial, but flat, as if cut out of paper and pasted on, the black branches and green leaves, the livid, glaring houses, with roofs of dead, scarce perceptible red (as when an iron turning white-hot from red-hot in the stithy grows also dull and dim). "It looks like the eve of the coming of Antichrist, as described in Mediæval hymns," remarked Vere, "the sun, before setting never more to rise, sucking all life out of the earth, leaving it but a mound of livid cinders, barren and crumbling, through which the buried nations will easily break their way when they arise." As I have above said, I do not discern the purpose of the writer of this paper; but it would be impossible to illustrate more clearly this chronic insanity of infidel thought which makes all Nature spectral; while, with exactly correspondent and reflective power, whatever is dreadful or disordered in external things reproduces itself in disease of the human mind affected by them.

### BIRMINGHAM ARCHITECTURAL ASSOCIATION.

THE members of this Association on Friday in last week visited North Wales, and were enabled, by the courtesy of Mr. J. C. Edwards, the proprietor of the Pen-y-bout Terra-cotta Works, to view the manufacture of bricks, encaustic tiles, and terra-cotta. Amongst those present were Messrs. W. H. Kendrick, B. Corser, W. Doubleday, E. Wood, E. Eayres, H. H. McConnal, F. E. F. Bailey, C. E. Bateman, V. Scruton, T. W. F. Newton, and Franklin Cross (hon. sec.). On arrival at Chirk, at 10.49 a.m., the party were met by carriages, and driven straight to the works, where they were conducted round by the proprietor, who explained the whole process of manufacture, from the time when the clay rests in its natural bed to the time when it leaves Ruabon as terra-cotta, by rail or water, for all parts of the United Kingdom. Almost every conceivable feature of architectural adornment was seen in course of manufacture, and great admiration was expressed at the beautiful colour, texture, and excellent workmanship of the blocks. In the modelling-room was seen a large model of *Flora*, the architectural destination of which, when finished, is the Smithfield Vegetable Market, now in course of erection for the Corporation of Birmingham. The manufacture of encaustic tiles was also explained. The party again took to carriages, and were driven to the home of Mr. Edwards, near Llangollen, where they were entertained at luncheon by that gentleman. After lunch, Mr. W. H. Kendrick gave the toast of "Our Host," which was supported by Mr. Franklin Cross, and acknowledged by Mr. Edwards. A mountain ascent in the afternoon afforded a view of the lovely vale of Llangollen, and the rest of the day was spent in Mr. Edwards' grounds and garden. Bidding adieu to this beautiful spot, and, after a drive of six miles, crossing by the way the vale of Llangollen, the party arrived at Chirk Station, whence they returned by train to Birmingham.

### NATIONAL COMPETITION DRAWINGS.

THE reports have been published of the examiners upon the National Competition Drawings in June 1882—viz., Messrs. Poynter, R.A., Marks, R.A., Leslie, R.A., Yeames, R.A., W. Morris, Stevenson, Armstrong, Bowler, and Professor Unwin.

1. *Drawing from the Antique and from Life, and Modelling the Figure.*—The gold medal for the antique was obtained by a drawing from Manchester of great merit, shown in the application of careful work without excessive labour, in which a thoroughly complete result was obtained. The award was not made with a view to the encouragement of the particular method of execution employed, but on account of the really excellent qualities of drawing and finish; it being understood that high finish on a foundation of good drawing, and without waste of time spent on misapplied labour, is an essential of the best style. A bronze medal was awarded to a drawing of the *Clapping Faun*, which, though in a broader style and less complete in execution, was generally correct in proportion and outline.

It is considered that it would be an advantage if the students who make drawings of the full-length figure should in some way indicate the level of the eye; the doing so would in many cases assist them in avoiding errors of perspective in the treatment of their subjects, and put the examiners in a better position to judge their work. The black-and-white studies of heads from the life were this year generally below the average of former years. Much

of the modelling work was very good, notably the full-length figures from the life, and several heads; but some of the heads modelled from the antique were altogether wanting in correctness of form—absolutely necessary for success in modelling. Many models were sent up of considerable weight, which were far below the hope of a reward in the competition, and others so badly packed as to be too much injured for judgment. These errors should be avoided. Where the work sent up is of a very low standard the expenses may in future be disallowed.

2. *Painting in Monochrome and from the Life.*—The gold medal was gained by a study of the *Apollo Belvedere* from the Edinburgh Male School of Art, painted with directness and simplicity, and of much clearness of tone. A study from life, in water-colour, of a girl seated in an armchair gained a bronze medal for careful drawing and attention to truth, both of character and tone. If the objects selected and the details throughout had not been so essentially ugly, and so badly arranged, this painting would no doubt have gained a higher award.

3. *Architecture, Designs for Wall Decoration, and Modelling of Ornament.*—The highest award made for architectural design was given to a student of the Leicester School, who sent a set of several practical drawings of a cottage hospital, showing skill in design ably directed to its object. Elaborate drawings, overcrowded with details, obtained lower distinctions, though prepared for more pretentious buildings. Some figure designs for decoration failed in proper expression of their intention for want of any indication of the mouldings which would surround them in their place in any scheme of decoration. It is suggested that, in future, no awards should be made for figure compositions unless in combination with a general decorative scheme. It is to be regretted that in certain schools the instruction should, apparently, be devoted exclusively to Gothic architecture. The orders of Classic architecture being founded on strict and carefully-studied principles of proportion, and with details studiously appropriated to their various features, are of the highest value as a basis for the study of design, and should on no account be neglected. Some wall papers, which were fairly well designed as regards lines and spaces, failed for want of better colour.

4. *Designs for Carpets and Surface Decoration.*—Sufficient attention has not been given to the requisite difference of treatment of patterns for hangings and for flat surfaces. In many instances, notably from one school, patterns for fabrics were designed in the same colours and with precisely the same treatment as for wall papers, no allowance being made either for the difference of material and the nature of the colours used or for the different conditions under which the patterns must ultimately be displayed. Among the successful works from Macclesfield a bronze medal was given to a silk hanging for good design and happy seizure of the characteristics of style, although the colour was less satisfactory. Several rewards were given for designs to be executed in colour, in which the arrangement of lines and distribution of form were good, although changes in colour, such as could be made in execution, would be required to make them thoroughly successful. Five designs for tapestry hangings from West London obtained a silver medal, being well designed and coloured, but wanting in clearness of definition, and without explanation of scale.

5. *Still-life Painting.*—A silver medal was given to a work somewhat above the usual size from Ilkley, in which the treatment of diffused daylight was remarkably successful, so that in a wide space objects kept their places well, the student having encountered the difficulty of representing the relative positions of objects retiring from one another at considerable distances. It appears to the examiners that in some cases sprays of flowers so large have been chosen, as to be impossible of execution while fresh even by accomplished painters. The student is thus tempted to finish his group after the flowers become drooping or faded. In the studies for "tone" suggested in the last report, the intention of the examiners has been somewhat misunderstood, the objects chosen having been placed generally in the same plane with one another, and with insufficient space between them and the background. The objects should be represented at various distances behind each other, retiring into the picture; the merit of the work consisting in the accuracy of the rendering of the relative tones between the near and distant objects, and their relief from each other and from the background.

6. *Mechanical Drawings and Drawings from Measurement.*—No set of drawings was submitted of the type of good working drawings of fairly complicated machinery, although drawing of this kind is likely to be more generally useful and involves more knowledge than highly-finished shaded drawings of simple portions of machines. The highest distinction in machine-drawing, given for careful shading, was a bronze medal for works not reaching the standard attained in former years.

The following observations of the examiners of the local advanced examinations are added for the information of teachers:—

*Architecture.*—If students who are inadequately prepared could be prevented, or at least discouraged, from offering themselves for examination, the result would be beneficial, as students would be led to feel that an examination was a thing to work for, not to take on the bare chance of their possibly scraping through, as must have been done by some of those whose work has been looked

over. A great deal of bad drawing was found, and this even in cases where the replies in writing showed a fair, or even a good, knowledge of the subject. Even where the drawing was fairly good, it conveyed the impression of having been almost in every case learnt from the flat only, and often without a thorough grasp of the subject. If architectural students would produce freehand, pencil, or chalk outline from plaster casts of architectural foliage, and other ornaments, and of mouldings, so that the features of styles might be familiar to them, the examiner is of opinion that very great benefit would result. The drawing of the orders, which generally speaking was well, and in not a few cases admirably, done, may be excepted from the above remarks.

*Perspective.*—There seems to be a tendency amongst the candidates to cover the paper with the working lines; this only serves to confuse the drawing and can be of no use to the student when working out the problem. The candidates often attempted to work out on the ground line in the picture plane problems which could be more easily arrived at, and with greater accuracy, on the plane of the feature required or close to it. In the projection of shadows the examiner notes that very few, if any, of the candidates commence by ascertaining the line of demarcation of light and shade on the object itself which throws the shadow, and some of them go so far as to obtain the shadows thrown by lines which are themselves entirely in the shade.

## THE SCIENCE AND ART DEPARTMENT.

THE annual report of the Science and Art Department has been issued. It states that the numbers of persons who have during the year 1882 attended the schools and classes of science and art in connection with the Department are as follows, viz.: 68,581 attending science schools and classes in 1882 as against 61,177 in 1881, and 909,216 receiving instruction in art, showing a decrease upon the previous year of 481. The decrease is owing to a change of date for the examination in drawing of elementary schools.

The attendance at the art and educational libraries at South Kensington and at the National Library of Ireland in 1882 has been 85,837, or an increase of 888 over that of last year. The museums and collections under the superintendence of the Department in London, Dublin, and Edinburgh were last year visited by 2,476,049 persons, showing an increase of 11,511 on the number in 1881. The number of visitors to the South Kensington Museum shows a decrease of 55,298, the numbers being 1,017,024 for 1881, and 961,726 for 1882. The returns received of the number of visitors at the local art and industrial exhibitions, to which objects were contributed from the South Kensington Museum, show an attendance of 1,553,083. The total number of persons who during the year 1882 attended the different institutions and exhibitions in connection with the department has been upwards of 5,015,217. This total, compared with that of the previous year, presents an increase of 203,959 persons.

The expenditure of the department during the financial year 1882–3, exclusive of the vote for the geological survey, which was 18,536*l.* 17*s.* 4*d.*, amounted to 326,826*l.* 17*s.* 3*d.*

New schools of art have been established during 1882 at Canterbury, Chelsea, Dundee, Hornsey, Huddersfield, Peterborough, Scarborough, Stoke Newington, Tiverton, and Weston-super-Mare, and a branch class at Darlington. The total number of schools of art in operation throughout the kingdom was 169, and 13 branch classes. The total number of students in these schools and their branch classes was 33,729, as against 160 schools, 11 branch classes, and 31,592 students in 1881.

At the annual examination in April 1882, 21,291 students submitted 211,748 drawings or models; the corresponding numbers in 1881 having been 19,940 students, and 197,048 works, so that the annual increase reported in previous years is still maintained. In this examination 18,745 students, on account of whose instruction payments were made to the committees of the schools, were of the industrial classes. The annual examinations in second grade drawing were attended by 11,716 students of schools of art, of whom 5,501 were successful, and 1,517 obtained prizes, showing increases of 980 and 337 respectively.

The report refers to the long-projected gallery of casts of ancient classical sculpture. A small but fairly complete series of casts has now been acquired under the advice of the committee, and a portion of the new buildings has been appropriated for their exhibition. This, it is hoped, will be opened in the course of 1883. Mr. Walter C. Perry, to whose knowledge and exertions the collection owes so much, has been invited to prepare a descriptive catalogue. A special committee on building materials strongly recommended the maintenance, revision, and development of the collection. As yet no active measures have been taken to carry out these recommendations, as the tenure of the space in which the collection is deposited has been uncertain, but the Department hopes shortly to be able to do so, and also to make better provision for its exhibition; and, meanwhile, the aid of a committee of gentlemen specially conversant with building and engineering to advise in these respects has been secured.

## THE WELLINGTON MONUMENT IN ST. PAUL'S.

LORD JOHN MANNERS, who was the First Commissioner of Works when the design of the late Alfred Stevens for the Wellington monument was selected, is opposed to the project for removing the monument to some other position in the cathedral. His lordship writes :—

The site was chosen after a careful inspection by the then dean (Milman), Mr. Penrose, and myself. Until this present controversy arose I never heard that Mr. Stevens was dissatisfied with the arrangement then come to, and, as my relations with him were of the most friendly character, I think it unlikely he would have withheld from me his dissatisfaction had he entertained any; and Mr. Penrose, whose communications with him were necessarily frequent and confidential, informs me that Mr. Stevens never expressed to him any regret at the change of site. I remember perfectly well that we were unanimous in selecting the Consistory Court.

In addition to the arguments urged by Mr. Fergusson against the suggested removal, I would point to the beautiful allegorical sculptures by Mr. Woodington and Mr. Calder Marshall on the apsidal east and west walls of the chapel, which, from their shade, could not be transferred to a flat surface. Of the inconvenience and impropriety of moving memorials to the illustrious dead, except under urgent necessity, I need say nothing; in this case no such necessity exists, and I am authorised to say that the Duke of Wellington feels strongly on this aspect of the question.

I concur with Mr. Fergusson that what is wanted is the removal, not of the monument, but of the wooden screen which partially hides and spoils the effect of that fine work of art, and which, handsome and appropriate when the space it enclosed was used as the Consistory Court, is altogether inappropriate and incongruous when blocking from the nave the view of the Wellington monument. Instead, therefore, of a deputation to the Prime Minister to urge the removal of the monument, I would suggest a memorial to the Dean and Chapter praying for the removal of the screen in front of it.

## THE HALL AND CHURCH OF HIGH ERCALL.

THE old hall and church of High Erccall, in Shropshire, were lately visited by the members of the Severn Valley Field Club. Papers on the buildings were read by Mr. R. Anslow.

The erection of the hall was, he said, began in 1608 by Sir Francis Newport, knight, on the foundations of or in addition to the ancient residence of the De Erccalls, of which the arches now standing in an isolated position in rear of the present building may be a portion. An inscription on one of the north gables is as follows :—

“Ao. Dni.  
1608, ætat. vero suæ 52,  
Franciscus Newport miles,  
Hoc ædificium, Deo incepta  
Secundante, inchoavit, peregit.”

While another inscription on a stone in the garden wall runs thus :—

“Pars ista hujus Dom. inchoata fuit  
14 Martii anno 1617. Finita vero 13 Octobris  
anno 1620. Opera impensis Francisci  
Newport militis.”

Reading these inscriptions together it appears that this mansion took twelve years to build. In our days a town springs into existence in less time. Francis Newport, knight, was, however, no “speculative builder,” as these massive erections bear witness. Where the materials were procured there is no evidence to show. Tradition says they were brought from the ruins of Uriconium, having done intermediate duty in the fabric of Haughmond Abbey; but there is nothing to lend even a colouring of proof to this assumption, beyond the fact that the site of the Roman station was, at the time of the erection of this house, the property of the Newports. It is rarely that we meet with Elizabethan houses constructed so solidly as this. It was built, however, as much for a fortress as for a residence, and it is not at all improbable that some of these massive blocks may have come from the walls of Uriconium and Haughmond. The stone is certainly not from any local quarry. The massive oak timbers of the open roof are interesting, and must have come out of trunks of immense girth and singular formation. In various parts of the garden and grounds traces of the foundations of the larger residence and fortification are still discernible, especially on the eastern side, where some important structure has evidently stood. It was near here that in levelling a mound Mr. Steedman's labourers came upon a quantity of coins, about 1,000 in number, and weighing no less than 12½ lbs. The greater part were of the reigns of Charles I., some of Elizabeth, and a few of Philip and Mary. Cannon-balls and musket-bullets have been also found here, some of which, and a portion of the coins, Mr. Steedman will exhibit. In the

restoration of this historical house some twenty years ago Mr. Steedman was thoroughly imbued with the spirit of the original builders. The work was well done, and bids fair to always remain in the category of “unexhausted improvements.” The moat which surrounded the hall ran along the present churchyard wall, and in the direction that has been pointed out.

There is no mention of a church at Erccall in the Domesday Survey. The mother-church of the parish, Mr. Eyton thinks, stood at Rodington. But within eight years the supremacy was given to Erccall, as in 1094 “the church of Archalou, with all things pertaining thereto,” was given by Earl Roger to Shrewsbury Abbey. That the first church here was not of Saxon origin is proven by the fact that it was dedicated to St. Edward the Confessor. Probably it was erected by the Norman earl. The present edifice, Mr. Street supposed, was erected on the foundations of the original church in or about 1280, and is dedicated to St. Michael. Instances of a change in the saintly dedication of churches are of rare occurrence. No record exists as to why the change was made here. Probably it was one of the many revolutions and alterations incident to the attempted suppression of the Saxon race. Mr. Eyton observes that he had been unable to discover that it had been done by any ecclesiastical authority. The church, as will be observed, consists of a nave, with north and south aisles, chancel, and chancel aisle. The arcades are of great beauty, and typically illustrate the style of the period. The bases of the pillars are, however, evidently of greater age than the pillars themselves, and may have been portions of the original Norman structure. They resemble very closely the bases of the pillars at Buildwas. The curious and almost grotesque carvings on some of the capitals are very interesting objects, and of unusual occurrence in a thirteenth-century church. The church was considerably damaged during the siege of the hall, after which it was, no doubt, repaired and put very much into the state in which Mr. Street found it in 1863. The inside walls, roof, and arcades were then covered with thick coats of plaster, and the bases of the pillars hidden beneath the flooring. Mr. Street, finding that he had good material to work upon, succeeded in transforming the interior into the splendid condition in which it appears now. This was done at a cost of 1,600*l.*, exclusive of the new south porch. The tower—then, as now, in excellent preservation—appears to be of later date than the body of the edifice. Its Perpendicular lines suggest its erection something like a century or more subsequently.

## THE NEW TOWN HALL, LERWICK.

THE new town hall in Lerwick, the chief town of Shetland, has been opened. The building is designed in the old Scottish style, with massive walls and crow-stepped gables. It stands on the most elevated part of the ridge on which the town of Lerwick is built, and adjoins the county buildings, with which it groups. The materials are local freestone, with Isle Edday stone dressings, the former being of a grey, the latter of a cream colour. The buildings belong to a limited liability company. The planning is as follows: On the ground-floor, burgh court-hall, measuring 24 feet by 30 feet; magistrates' rooms, safes, and police-cells. On the opposite side of the main corridor are Custom House offices and Inland Revenue offices, with various departmental offices and stores attached, and with entrance from the north elevation. On the first floor, which is reached by a wide stone stair, is placed the town hall, measuring 60 feet by 30 feet, and 25 feet high, with timber ceiling running up to the roof. On the left side of the main stair are placed refreshment and retiring rooms, and on the right side a reading and news room, 22 feet wide by 23 feet long. Over this portion of the building are two smaller halls, respectively measuring 22 feet by 23 feet, with smaller side-rooms and a staircase opening into the tower. These various halls and chambers have been arranged and grouped together so as to form a handsome structure. Externally, the front elevation presents a façade with a central gable, and turrets at the angles; while over the central staircase rises a tower 72 feet high, finished with corbelled turrets and battlemented cope, and designed to receive a clock and peal of bells. The main entrance to the hall, &c., is through a carved and moulded archway, over which is an oriel window corbelled out and surmounted by a steep-pitched gable. The hall occupies the whole front of the upper flat, and is lighted by means of oriels and four mullioned windows in front, in the south gable by mullioned and traceried windows, and on the north by a large traceried wheel window, with series of lancets below. The elevations are of simple design, boldly and broadly treated. In the front, the windows are placed over each other, and the dados between filled in with coats-of-arms of peers now or formerly connected with the district, as also historical subjects, the whole carved in Covesea stone. At the entrance are two handsome iron lamps, given by the decoration committee. They rest on polished blocks of granite from Roness Hill, in the north of Zetland. The coats of arms over the lower windows read as follows, beginning at the north end: 1st, Earls of Zetland and Morton, and in the centre the Dragon ship of the Vikings, copied from Orkneyinga Saga; 2nd, Earls of Orkney and Baron Sinclair,

with Lion of Norway, central shield; 3rd, Stuarts and Earl Caithness on the Lion of Scotland; 4th, Bothwell, Duke of Orkney, and Earl Rosslyn, and Galley of Orkney. The interspaces between shields have carved ferns, firs, thistle, and ropes respectively, and over the oriel window are placed the town arms of the burgh of Lerwick. On entering the corridor, the arms of the following towns are seen let into recesses of the wall, and forming an effective panel along the corridor, viz.: On the left the arms of Glasgow, Edinburgh, and Leith, presented by their respective corporations; on the right, the arms of Aberdeen and Dundee, those of Dundee being the gift of William Strong, merchant in that town, a native of Shetland Islands. In the staircase is carved an antique representation in stone of the Kirkwall town arms, presented by Mr. Peace, of Kirkwall. On the first floor is the hall, which presents an attractive appearance. The walls are in plaster, with a dado 4 feet high. The roof is formed of arched main ribs, the spaces between being panelled and lined with pitch pine. The main couples rest on stone corbels; the whole being designed for coloured decoration, though meantime the roof is only varnished and slightly stained. The hall is intended to serve for public concerts and meetings, and was originally designed to have an end gallery, which has been omitted for the present time, but which can be added at any future date. The hall is lighted by tracery windows, and these have been filled in with stained glass, the gift of various gentlemen interested in the prosperity of Lerwick. Commencing at the south gable are Harold Harfager and Jare Rognavald, Archbishop Evstein and Bishop William, gifted respectively by Earl of Zetland and Sheriff Thoms. The chimney-pieces are the gifts of Mr. T. R. Spence, of Uyea, and of Mr. L. F. U. Garriock, of Berry, and are formed of freestone, with columns and panels of Shetland serpentine of a green colour, which is found at Half Drunnie, near Uyea, and of marble from Burwick. The clock is the gift of Mr. J. B. Leask, in memory of his uncle. The window in the staircase was placed there by the Morton Lodge of Freemasons. The whole was designed by Mr. Alexander Ross, Inverness, the contractor for the works being Mr. John M. Aitken, Lerwick. The cost of the building, exclusive of gifts, will be about 4,500*l*.

### THE NEW DEWSBURY INFIRMARY.

ON to-day (Saturday) the new building for the Dewsbury and District General Infirmary will be opened. It was designed by Mr. A. H. Kirk, of the firm of Kirk & Sons, Huddersfield, after a minute examination of several of the principal infirmaries in England. It deserves to be mentioned that, although an unusual amount of labour was entailed on the architect, he generously rendered his services without cost to the committee.

The style adopted for the building is Gothic. The principal elevation is to the west, where there is a clock-tower 90 feet high. Above the visitors' entrance is an oriel window, over which is a sculptured group of *Charity*, beneath a canopy and flanked by shields bearing the arms of Dewsbury and Ravensthorpe. The arms of various other neighbouring towns are also carved on the western and northern fronts. The patients' doorway is in the north front, and is sheltered by a porch of glass and iron. The principal staircase is lighted by a three-light window filled with stained glass, the subject being *Christ Healing the Sick*. The stained-glass windows are by Mr. S. Evans, of Smethwick.

The large wards run north and south. They are lighted by lofty windows at the sides and at the south end, the upper ward having a balcony outside, which may be used by patients. Each window is in three parts, the two lowest sliding up and down in the ordinary way. That at the top works on hinges, and by an improved rack is readily adjusted. Ample ventilation is thus secured, but, to insure air beneath and around the beds, fresh air, warmed as it passes over double steam pipes, is admitted near the floor level by sliding grates, which are so placed as to be readily got at by the nurses when readjustment is necessary. Sherringham's ventilators are also used near the ceiling, and these are aided in each ward by a hot-air stove. In the angles near the south end and close to the ceiling are extracting-flues, regulated by Hayward's louvred ventilators. Mr. Ellison's radiator ventilators have also been employed. The ventilating globe lights also assist to convey away bad air. There are three of these, each having a large argand burner; but in no case do the products of combustion enter the apartments, the gases being carried outside the building by special flues. The chandeliers, lamps, &c., have been supplied by Messrs. Richardson, Ellison & Co., and Messrs. Winfield. A supply of air may come into the wards from the main corridors, in which there will always be "blow-through," the temperature being regulated, according to the season, by means of a hot-water warming apparatus. A special ward and the board-room have similar windows, the globe lights, and sliding ventilators, but in each of these apartments Messrs. Shorland & Co.'s Manchester hot-air grate has been introduced. There are smaller wards for single patients, lighted and heated in the ordinary way, and ventilated by Boyle's patent apparatus. The arrangements for the apartments provided for the honorary medical staff; and for those of the house surgeon and matron are similar. In all these, as in

the small wards, and in the chambers in the top storey, the store-rooms, &c., there are vertical ventilating tubes, with regulating valves for the admission of fresh air. The corridors are lighted east and west, and in the centre (on the north side), by large windows. There is through ventilation, and in addition an extracting flue passes up through the roof—an iron pipe running by the chimney of the heating apparatus, and a current of air is thus always flowing. Long lengths of iron pipes, and three coils fitted with hot water, will keep up the temperature in the corridors to such a degree as may be required. The ornamental metal work is by Messrs. Macfarlane & Co.

The flooring of all the rooms in the infirmary is of the best Stettin oak, those in the wards and in other departments being polished. The floors of the corridors, &c., are constructed by Messrs. Dennett & Ingle in their fireproof concrete, lined at the sides with encaustic tiles supplied by Messrs. Minton, Hollins & Co. In the corridors and throughout the building the plinths are of cement. The walls are of plaster, finished in Parian cement. In the basement is the dispensary, comprising surgery, doctors' examination and consulting rooms, with a larger apartment for out-patients. The floors of all these apartments are of wood blocks, chemically prepared, and laid, each piece on a compound of hot pitch and resin spread on a solid concrete bed. The kitchen has a floor of cement concrete, and contains a Leamington range, with hood over, coupled to a flue, so that the gases produced in cooking will be carried off. Food-lifts run from the basement storey to the lower and upper ward-kitchen. The apparatus is the patent of Messrs. Thomas & Sons, of Cardiff, and is incapable of being moved, except by means provided for the purpose, and which will be under control from any storey. Another hoist, known as the hydraulic telescopic-ram lift, runs from the basement to the top storey, and in it a patient brought in on an ambulance or a stretcher can be carried directly to the door of the operating theatre or to the upper wards. Safety appliances are provided. The apparatus is the manufacture of Messrs. Archibald Smith & Stevens. For the speedy and cleanly removal of dirty linen and sweepings "shoots" are provided. They communicate with apartments at the basements, the only doors to which are outside the building.

### THE EXCAVATIONS AT EPHEBUS.

A STATEMENT has been prepared by Mr. Beresford-Hope, the chairman of the committee, respecting Mr. Wood's proceedings at Ephesus during the past year. In March of the present year, the sanction of the trustees of the British Museum having been obtained, Mr. Wood was authorised by the committee to proceed to Ephesus and resume the excavations which had been so long in abeyance for want of funds. The freehold of the site of the temple had been purchased by the trustees of the British Museum during the time of the former excavations. Their right to resume the works seemed accordingly to be clear, although the question of the privilege of removing the sculptures which might be found was more disputed. Mr. Wood, however, had not long resumed his work when the Mudir of the district visited the spot, and reported their recommencement to the Kaimachan of Scala Nova, who in his turn reported the same to the Governor of Smyrna, and in due time the Mudir received his written instructions to stop the excavations. In obedience then to the intimation of the Mudir, Mr. Wood suspended the work, which he had then carried on for eleven days, and took the first boat for Constantinople to obtain a fresh permit from the Ottoman Government. This interruption delayed operations for several weeks, but happily the required document was eventually obtained through the effectual good offices of Lord Granville and of the Embassy at Constantinople, and in three days from the time when the request was submitted to the Sultan the permit was handed to Mr. Wood by the Minister of Public Instruction. Mr. Wood then returned without delay and resumed the excavations. By this time the cool weather had passed away, and the hot season had set in, but as he was anxious to make some important discovery before abandoning the work till the autumn, Mr. Wood persevered until June 15, when he was forced to stop, for not only did the heat prevent the workmen from doing a fair day's work, but the water still stood in the excavations at a level which prevented the recovery of the stones which could be felt through the mud.

Several interesting inscriptions and fragments of sculpture were, however, secured. The latter evidently belonged to the pediment at the east end of the temple. The most interesting of these was the leg of a male figure in high relief, somewhat larger than life.

At a committee meeting held on July 24 it was decided to authorise Mr. Wood to return to Ephesus in September and resume the excavations. The committee was justified in this decision by the fact that a large area had been opened up to an average depth of 17 feet in the few weeks of work during the spring and early summer, while the stones which could only be felt at that time through the mud and water could be easily removed in the autumn after the water will have subsided for a depth of several feet. It is most desirable that the archæological public

should subscribe liberally, if they desire the success of this most interesting exploration. If it is carried on as it ought to be to the extent proposed—namely, to the outer face of the colonnade which surrounded the temple—the result will probably be the unearthing both of beautiful sculptures and inscriptions possessing historical value. The discoveries which reach England will be placed in the gallery which is to be devoted at the British Museum to the Ephesian antiquities, and will be a great addition of permanent value to the national art treasures.

### NORTH STOKE CHURCH.

ONE of the places visited lately by the members of the Berkshire Archaeological Society was North Stoke, near Moulshford. The name was formerly Stoches—an inhabited or stockaded place. At one time it had a Saxon church built of masonry, and not of wood, as was usual in that locality. The present church was built by Milo Crispin, youngest son of Gilbert Crispin, and he called over the monks of Bec and conferred on them the manor of Swincombe. Milo Crispin, who died in 1107, had a half-brother on the establishment. At a later period the church was transferred to the convent at Bromhead, near Sunninghill; and it was reconstructed, on the old lines, between the years 1437 and 1461. At the Reformation the church came into the possession of St. John's College, Cambridge.

Mr. Jos. Morris said that the church was unusually symmetrical in plan, and consisted of nave, chancel, western tower, and porch. The chancel was Early English in style (c. 1200), and the rest of the church Decorated (c. 1320). The nave was divided into three bays, the windows being equally spaced and the doors opposite to each other. The walls were massive, being about 2 feet 10 inches thick; the windows were simple, but characteristic; the doorways were plain, but well proportioned; and the mouldings, though few, were effective. The door, with its ironwork, was as old as the wall on which it hung. The walls were out of the upright, having probably suffered from the thrust of the original roof, which had been replaced by one of later date (sixteenth century). The floor contained many old encaustic tiles of various patterns, chiefly geometrical and floral. The pulpit was good of its kind, and had escaped the common enemy of most wooden pulpits—the paint-brush. It was probably the work of the reign of James I. or Charles I.—1610 to 1630. Some frescoes had lately been exposed, of which the colours were very bright and the drawing clear. The font was very interesting, and probably dated from about 1200—the same period as the chancel. The windows in the north and south walls of the chancel were good. The shafts and abacus mouldings were of Purbeck marble. The carvings of the capitals were varied and curious, though rudely executed. The two openings near to the chapel arch seemed to be later insertions, and might possibly have been lepers' windows, the heads and sills being rebated as if to receive a door or shutter. The chancel arch was very fine, but was sadly crippled, having spread  $3\frac{1}{2}$  inches in the height of the shaft; the arch itself was probably built of true lancet form. The eastern window was originally of the Decorated period, the square head being apparently added at a later date. A piscina, a small recess, and a stone seat occurred along the south wall. The lower stage or basement of the tower was very bold and handsome. There was an intermixture of Early English and Decorated in the three windows, especially as the base windows seemed to belong to the latter period. There were three bells bearing date 1601, 1636, and 1727, and probably (though not necessarily) the rebuilding of the upper part of the tower was marked as having taken place at one of those times; if so, the latest was the most likely. There was an ancient bier, probably of date about 1680 or 1700, and some remains of the old oaken porch, which he attributed to the former half of the sixteenth century. On the south side of the church was a curious sun-dial. The head at the top appeared to be fourteenth-century work, and was beautifully executed, while the shield and hands were of ruder workmanship. There was an old apex stone on the east gable of the nave, and on the wall of the same gable a drip-course marked the line of the old roof of the chancel. There was quite sufficient left of the old oak porch to allow of its restoration; and he hoped that when the church was restored the present porch would be retained.

A paper by the Rev. W. S. Barns, on the frescoes lately discovered on the removal of the sounding-board from the pulpit, was read. From the few traces of designs as yet uncovered on the lower part of the walls, it is probable that incidents from the New Testament, or from the lives of the saints and martyrs, occupied the most conspicuous positions in the line of sight. Above these were a series of frescoes of much smaller size and more sombre colours, familiar subjects, possibly, from the Old Testament, such as would afford suggestive lessons to those who might see them and think of them. The two frescoes as yet uncovered may represent, the one on the left the persecution of the Israelites in Egypt, the one on the right the judgment of Solomon. Other suggestions may be forthcoming, if other members of the series are found, but as far as the details of the figures are clear,

the above seems the most likely interpretation. The fresco on the left hand, nearest the window, consists of a group of figures standing, and yet full of energy and motion. The figure on the right is drawn with much action, and is apparently an officer, with a battle-axe over his left shoulder: he is holding up his right hand to give emphasis to some order which the figure immediately in front of him appears to be carrying out. This one has a club over his left shoulder, and a scourge raised in his right hand; regardless of the protests of those who are grouped before him, he is carrying out the injunctions of his superior officer, and threatening the woe of the scourge if his orders be disobeyed. The fresco is probably an illustration of Exodus v. 10, and is especially interesting from the form of the battle-axe, which, to one skilled in Mediæval armour, might possibly determine its date, and from the other weapons and costumes found in the design. The second fresco consists of three figures, which are very distinct, and one which the friable nature of the plaster has not allowed as yet to be safely uncovered. On the left is a figure sitting on a throne, similar in form to the coronation-chair in Westminster Abbey of the same date, with a cap surmounted by a small round knob, such as distinguishes Sennacherib from his subjects in the Assyrian monument in the British Museum. In his right hand is a sword, like the sword of justice of the same period now to be seen in Westminster Abbey, and his left hand is raised and stretched out as if in the act of emphasising some final decision. Before him is a suppliant, holding forth the right hand in earnest entreaty, while with the left hand pointing to or holding an indistinct figure behind. At the other end of the design is another figure, with a face full of boldness and impudence, who appears to be making a counter-claim before the judge. Both frescoes are enclosed in an indistinct pale-green border of simple scroll-work, and call for great care in their treatment and preservation. Such examples of Mediæval art are becoming very rare. Restoration has brought many to light, but more to ruin; and this not always from carelessness, but from the difficulty of removing the many coats of whitewash under which they have been preserved, and from their friable condition when uncovered.

### LONDON THEATRES.

A REPORT from the Building Act committee on the structural defects of theatres and music-halls was read at last week's meeting of the Metropolitan Board of Works, and the recommendations therein were unanimously agreed to. In the case of the Theatre Royal, Haymarket, it was recommended that a revised notice should be served on the owner as to the structural defects of the building, containing twelve important requirements, the works to be commenced within two months, and completed within six months. The committee reported that they had instructed the superintending architect to inform the solicitor whether the works specified in the Board's notice to the owners of the Adelphi Theatre have been completed; and that, in the event of such not being the case, the solicitor will proceed, in pursuance of the resolution of the Board, for the penalties to which the owners have rendered themselves liable under the 11th section of the Act of 1878. The Imperial Theatre, Tothill Street, Westminster, required seventeen alterations to remedy defects. In the Olympic Theatre, Wych Street, Strand, so great are considered the structural defects that no fewer than twenty-two important alterations are required, involving the building of a brick wall to divide the stage from the auditorium, the principal staircase to be reconstructed, the present gallery staircase to be reconstructed and an additional one provided, and a staircase on the stage removed, an additional exit on the south side of the theatre, and a doorway from the external wall on the north side of the theatre leading into Maypole Alley, to form an exit from the stalls and private boxes on the north side, the pit refreshment bar to be removed, as well as the gallery refreshment bar, and six rows of seats in the south-east angle of the gallery to be removed. All openings between the theatre proper and the houses in Wych Street and Craven Buildings to be stopped up with brickwork or be closed with wrought-iron doors in wrought-iron frames, and the theatre premises to be separated from all adjoining premises. In the Standard Theatre, Shoreditch High Street, to remedy structural defects twenty-one alterations are required, the principal of which are that the theatre be separated from all adjoining premises vertically by brick walls, that all openings between the theatre and such premises be stopped up with brickwork, that the pit-stall entrance be made 6 feet wide, that the staircase from the balcony to the upper circle and the pass staircases from the dress-circle to the upper circle be rebuilt of solid tooled York or other approved stone. In Gatti's Music-hall, Westminster Bridge Road, the committee recommended no departure from the requisitions of the notice to the owners, and that the matter in dispute be referred to the arbitrator.

Ellison's Patent "Radiator" Ventilators, in conjunction with Stevens' Exhaust, have been used in the ventilation of the large Exhibition Annexe, Technical School, Huddersfield.

## St. Paul's Cathedral.

SIR,—Had it not been for the feeling that everything in the design of the East Minster or Cathedral dedicated to St. Paul is so nearly related to perfection, doubtless the segmental arches which appear to trouble the artistic soul of Mr. R. F. Conder would have been liberally condemned by all who study the unity of design.

The feeling of complete satisfaction with which some regard the great metropolitan church prevents them from inquiring too deeply into the "reason why" of certain points of detail, which, in the eyes of the critical, are positive defects. And perhaps the most glaring of these are the segmental arches on the diagonal faces of the octagon carrying the dome.

Of the few public objectors to these arches, only one or two suggest an architectural substitute. Mr. Fergusson suggested detached columns supporting a horizontal entablature and balcony; but, when the narrowness of the openings is compared with the great height, it will be seen that the diameter would prove a serious inconvenience to the free passage. Mr. Wightwick's suggestion to repeat the arched arrangement of the nave, &c., seems the most feasible, and it is on this that Mr. Conder appears to base his proposal.

Looking at the effective sketch accompanying the proposal, the work appears a comparatively easy one, involving little structural alteration, except perhaps the removal of the springers of the segmental arches, which would richly repay in appearance the necessary outlay in money and trouble.

The extra arch inserted under the front arch, in lieu of the straight-sided pieces of masonry of Wren's arrangement, just gives the breadth which the springing seems to require to satisfy the eye. But the way in which the whole building is brought into a continuous whole by carrying round the attic and semicircular arch under is the crowning feature of the scheme, and would undoubtedly give the greatest satisfaction, not only to those who are versed in the mysteries of design, and who have to decorate the interior, but also to the uninitiated.

The objections which may be raised against such an alteration, on the ground of interference with the work of Sir Christopher Wren, are of course weighty as far as they go; but why should a narrow sentimentality prevent the carrying out of a work which most must admit would prove a success, and tend to add to the stability of the structure?

St. Paul's is, and ever will be, one of, if not the, most magnificent buildings in the country, and any proposal which originates from a desire to complete the perfection of its style deserves the encouragement of a candid, and at the same time a kindly, criticism from all who are avowed admirers of the building.

Yours, &c.,  
EDWIN C. PINKS.

SIR,—Mr. Roger T. Conder's article on the diagonal sides of the octagon beneath the dome must have opened the eyes of many, and suggested the formation of a society for obstructing modern improvements, possibly. For my part, I should like to see a society formed for carrying out this one in marble, which marble need not be utterly foreign or glaringly in contrast with the remainder of the fabric, as regards colour or surface treatment; but the extra richness of the material would fittingly emphasise the domal area, and I may add that, as these four compartments are by their position exceptional and emphatic, this extra sumptuousness of material would enrich the whole interior of St. Paul's. There is a want of sympathy in Sir Christopher's arrangement—or shall I say rhythm?—which the drawing of last week's issue establishes very effectually by contrast, and a casual glance ought to be sufficient to show any ordinary observer that it is infinitely preferable for the transeptal aisle to read round into the choral than that they should be disrupted by what has been so ably shown to be a weakness and a flaw. Still, the subject is so interesting that I should like to see a better view published—one that would convince the most obstinate obstructionist that Art can be doomed to writhe under. There are too many such. But it may be a cool idea to ask anyone to draw to please them; and yet I believe there is a good deal in a drawing and the manner in which sometimes the public fancy may be taken, the truth being in the fact that that weakness, however new as to the pointing out of it, has been always there and always felt.

I hope we may be favoured with a view showing marble treatment. I could not make one, if I tried till the Greek Kalends.

Yours faithfully,  
H. W.

The Paris Municipality on Monday last voted 1,200,000 frs. for the purchase of the site of the Gallo-Roman Amphitheatre in the Rue Monge.

## LEGAL.

## High Court of Justice.

(Before Mr. Justice DENMAN.)

## THE SANDGATE LOCAL BOARD OF HEALTH v. LENEY.

This was an action brought by the Local Board of Sandgate against Mr. Leney, the owner of the Royal Kent Hotel in that town, to obtain an injunction against his building over a sewer which passes through a part of the yard of the hotel and to compel him to pull down so much of the building as was already erected. It appeared that some time before 1857 the then Local Board laid the sewer in question, a 12-inch pipe, at a depth of some 9 feet below the surface of the yard; and that disputes having arisen between Mr. Gidley, the then owner of the hotel, the predecessor of Mr. Leney, and the Local Board as to the Board's right to the sewer and other matters, an agreement was entered into by a deed between Mr. Gidley and the Board on February 14, 1857, in which the Board admitted that they had no right to the sewer without having made compensation to the owner of the yard. It was agreed that Mr. Gidley should allow the Board to continue the sewer, and, on the other hand, that Mr. Gidley and his successors should have the right to build over the sewer so long as such building should not injure or affect the sewer or prevent access to it on all requisite occasions. In June last Mr. Leney commenced the building now complained of, contending that he was entitled to do so in any way he pleased so long as the Local Board were allowed, when necessary, access to the sewer through the buildings, the Local Board at the same time being liable to make good any damage their operations might cause to the buildings. The Local Board, on the other hand, contended that the deed gave them access to the sewer along its whole length without entering upon any building or removing any superstructure, and they also complained that, from the nature of the building, the expense of the access to the sewer was materially increased by the necessity of taking precautions to prevent subsidence of the walls and other damage to the building. The Local Board applied in September of last year to the vacation judge for an injunction to prevent the continuance of the building until the action should be tried; but this was not granted, it being thought more convenient that Mr. Leney should be permitted to continue the building at the risk of having to pull it down if the action should result in a decision against him. The plaintiffs accordingly now claimed an injunction to prevent further building, and an order that the defendant should pull down such of the buildings already erected as interfered with the plaintiffs' right of access to the sewer.

His Lordship said that he ought not to grant a mandatory injunction unless there had been a substantial interference with the rights of the Board. He did not agree with the contention for the defendant that, unless access to the sewer was absolutely prevented, he was within the provisions of the agreement; he thought that the meaning of the agreement was that the Board should be able to have access to the sewer with reasonable rapidity in case of necessity, and the effect of the evidence was to show that the Board had now such access as was contemplated by the agreement. Judgment was accordingly entered for the defendant with costs.

(Before Mr. Justice KAY.)

## GARD v. THE COMMISSIONERS OF SEWERS FOR THE CITY OF LONDON.

## COMPULSORY PURCHASE.

This action arose out of the late fire in Wood Street, in the City of London. The action was brought by trustees on behalf of infants, the owners of two houses, Nos. 44 and 45 Wood Street. It appeared that the Commissioners of Sewers, under the powers of an Act of 57 Geo. III., had given notice to the plaintiffs of their intention to take the two houses in question for the purpose of widening Wood Street. It was admitted by the Commissioners that the houses only projected into the street to the extent of 5 feet 6 inches, and that, so far as concerned the rest of the houses, the intention of the Commissioners was to sell them with a view of thereby making a profit; and it was stated, and not denied, that they had in fact entered into an agreement to sell so much of the site as remained after widening the street and taking down and demolishing the existing buildings (which had been to a great extent destroyed by the fire) to the present tenants, for the erection thereon of larger premises. The plaintiffs contended that the Commissioners had no power to take more of the houses than was required for the purpose of widening the street, and accordingly brought this action for an injunction to restrain them from proceeding on the notice to treat. The question, therefore, resolved itself into one as to the powers of the Commissioners under the Act, by which it was in effect enacted that "If any house, wall, building, tenement, or hereditaments, or any part thereof, should be adjudged by the Commissioners to project into, obstruct, or prevent the altering, widening, or extending of any street, and that the possession, occupation, and purchase of such house, &c., would be necessary for that purpose," then the Commissioners might

compulsorily purchase such house, &c. The Commissioners had by a resolution formally adjudged that the whole of the houses, Nos. 44 and 45 Wood Street, projected into, obstructed, or prevented the widening of the street, and that the possession, occupation, and purchase of them was necessary for that purpose.

Mr. Justice Kay said that the Act of Parliament meant that the Commissioners were not to take more of the houses than they *bonâ fide* adjudged to be necessary for the physical purpose of widening the street, and did not extend to the taking of other and extra land beyond what was, in fact, wanted for that purpose. There might very often be cases where, at the moment of their adjudication, the Commissioners did not know exactly how much they wanted, and *bonâ fide* could not say whether they wanted five feet or five yards, and therefore they might *bonâ fide* adjudicate that a larger quantity was wanted than actually was necessary; but the contention that they could do that when they had come to a conclusion exactly as to what they did want seemed to him to be wrong. His Lordship therefore gave judgment declaring that the adjudication of the Commissioners was *ultra vires* and wrong, and restraining them from proceeding further with their notice to treat.

## CHURCH BUILDING AND RESTORATION.

**Augustine Church, Greenock.**—The memorial-stone of the Augustine Established Church has been laid by Mr. J. J. Grieve. The site of the building is at the corner of Belville Street and East William Street. The cost of the church will be about 3,400*l*. The contractor is Mr. W. Steele, and Mr. William Landless, of Glasgow, is the architect.

**St. Kew Church, Cornwall.**—This church was reopened on July 24 by the Bishop of Truro, after complete restoration, under the direction of Messrs. Hine & Odgers, Plymouth. It is one of the largest and loftiest of the three-aisle Cornish churches of the fifteenth century, and has a fine tower at the west end. The chancel is of unusual length. There is no chancel arch, but the divisional line was formed by a rood screen, of which only one or two fragments remain. The roofs are of the waggon type, and have been kept by the restorers in the original form. It was found the timbers only needed repair. Boarding, however, has taken the place of plaster in the panels between the carved oak ribs. At the feet of the rafters on each side are ranged a row of angels in their ancient positions. Those of the chancel roof have been painted and gilded to correspond with an existing one with original colour on it, which was found with other interesting remains hidden away in an old chest. There are many curious inscribed stones in "Delabole" slabs, which have been relaid as nearly as possible in their former positions. The floor under seats is chiefly formed of wood blocks laid herring-bone fashion. The chancel is paved with Maw's tiles; all the new fixed woodwork—which is admirably executed—is of oak. The eastern portion of the nave has fixed seats, with bench ends moulded and carved to agree with four ancient ends which have been refixed. There are double stalls on each side of the choir, elaborately carved. On the caps of the stall ends stand finely-sculptured angels, seven in number. The north and south chapels are separated from the chancel by parclooses of open-traceried work. A corresponding screen, but more richly carved, is carried along the western ends of choir and chapels, the height of the screens being about 11½ feet. The head of the opening into the chancel is cusped and crocketed, and doves have been introduced in the carving on either side. Conspicuous in the central screen is a fine piece of the original one. The stonework of the windows, doorways, and walls has been carefully restored with as little disturbance as possible of ancient material. The ancient glass of this church is of great interest, and the grand east window of the north chapel may be regarded as a remarkable "find," for before restoration it was in numberless obscure fragments. It was found to illustrate various events in the life of Christ—as His entry into Jerusalem, washing the disciples' feet, His agony in the garden, and before Pilate. It appears likely there was a second window further illustrating the Saviour's life. In the one restored there is scarcely any modern glass, and it is deemed the most perfect ancient window in Cornwall. The date of it is about 1470. At the east end of the south chapel there are remains of a fine "Jesse" window. All the glass work was executed by Messrs. Fouracre & Watson, under the architects' direction. The modern altar appointments are very beautiful, and much of the needlework has been executed by ladies of Clewer. At the celebration on the occasion of the opening of the church was used, for the first time, it is thought, for a century, the unique and valuable hanap or chalice of the date 1598, belonging to St. Kew, and one of the finest specimens of English silversmith's work of the kind in the kingdom. It was entrusted to Messrs. Singer & Sons, of Frome, for restoration. At the luncheon after the service Mr. Hine (architect) alluded to the interest Bishop (now Archbishop) Benson had taken in this restoration, and said he valued much the draft specification with His Grace's copious and practical marginal notes made during a lengthened visit to the church.

## GENERAL.

**Dr. Schliemann** has returned to Germany from Athens.

**A Statue of the late Earl of Beaconsfield**, subscribed for by the members, has been placed in the Conservative Club. The statue is the work of Count Gleichen.

**Sir John Lubbock** on Wednesday opened the Fine Art and Industrial Exhibition at Oldham, which has been inaugurated by the Corporation at a cost of about 20,000*l*.

**Mr. James Pegram** has presented to the Walker Art Gallery, Liverpool, the large picture by Mr. Dendy Sadler, entitled *Friday*, valued at 1,000*l*.

**An Art and Industrial Exhibition** was opened in the Aquarium buildings at Tynemouth on Monday.

**The Annual Meeting** of the members of the Royal Association for the Promotion of Fine Arts in Scotland was held on Tuesday in Edinburgh. A sum of about 200,000*l*. has been expended in the purchase of works of art by the managing committee during the past forty-nine years.

**A Carved Stone Pulpit**, designed by Mr. A. E. Dempster, architect, has been erected in All Saints Memorial Church, Birmingham.

**Mr. J. P. Pritchett, F.R.I.B.A.**, of Darlington, has designed a memorial tomb for the late Mr. R. H. Allan, to be erected in the West Cemetery, Darlington.

**Mr. Edge** has been appointed architect for the proposed new hospital at Bromsgrove, and has consented to waive all claims on the guardians in connection with plans previously prepared.

**Professor G. M. Humphry, M.D., F.R.S.**, has accepted the presidency of the Congress of the Sanitary Institute, which is to be held at Glasgow next month.

**Artisans' Dwellings** are to be erected at Rochester. A company is being formed to carry out the scheme, and land sufficient for 200 houses has been leased from the Bridge-wardens.

**The International Electric Exhibition** in Vienna will not be opened until August 16.

**A Subsidence of Land**, caused by mining operations, occurred on Wednesday morning at Boosbeck, in Cleveland. Seventeen dwelling-houses situate in Albion Street have been completely wrecked.

**The Crystal Palace Company's Report**, to be submitted at the half-yearly general meeting on the 9th inst., has a reference as to the desirability of removing the theatre from the building, on account of the cost and difficulty of insurance, and states that the directors have determined to advertise for designs and plans, with a view to obtain an estimate of the cost of a theatre to be erected outside the palace in the company's grounds.

**Mr. Horace Jones** stated at last week's meeting of the Common Council, that the stones of Temple Bar had been duly marked and removed to vacant land in Farringdon Street. They were now exposed to the weather, and every year they would get more decomposed.

**The Apex Stone of the Cross** on the western front of St Albans Cathedral was fixed by Sir Edmund Beckett, Bart., Q.C., on Tuesday. The extreme height of the cross is 109 feet 2½ inches from the floor of the porch, and it is more than a ton in weight. It is expected that within two months the work of rebuilding the west front—which is being done at the sole expense of Sir Edmund Beckett—will be completed.

**Lady John Scott**, of Spottiswoode, is at present personally superintending the opening of a supposed Picts' house or broch on a farm at Oust, Forss, about four or five miles to the south-west of Thurso. Very little has yet been done in the way of excavation. On Friday week two stone stairs, each containing sixteen steps, had been discovered in the north-east corner of the building, and almost opposite to these what seems to be an outlet.

**The Select Committee of the House of Lords** appointed to inquire into the Bill promoted by the Corporation of London for the removal of the ventilator in the roadway of Queen Victoria Street, decided on Wednesday that they had not the power to order its removal to another spot.

**Trade Marks Registration.**—The Registrar of Trade Marks has issued the following notice relative to the abandonment of applications. Rule 16 of the Rules under the Trade Marks Registration Acts is as follows: "In all cases where an applicant neglects to proceed with the registration of his mark within twelve months from the date of application, or within six months from the date of the expiry of the advertisement in the official journal, the Registrar may deem such application to be abandoned." It is intended to apply this rule from October 1, 1883, and it is important, therefore, that any person who has a pending application for the registration of a trade mark on record at the Registrar's office (whether lodged by himself or through an agent), and has neglected to proceed with the same as mentioned in the above rule, should take immediate steps to prevent such application from being cancelled by the Registrar as abandoned.

# SUPPLEMENT

TO THE

# ARCHITECT

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, AUGUST 4, 1883.

### CONTRACTS OPEN.

NOTE.—The superior reflecting power generated by Daylight and other reflectors silvered by our process is acknowledged by the highest scientific authorities to be the most powerful extant. 20 per cent. more light is obtained and perfect action guaranteed for fifteen years in any climate.

BY HER MAJESTY'S ROYAL LETTERS PATENT

ESTABLISHED A.D. 1774.

AUSTIN'S SUPERFINE FLAX LINE.

The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making five qualities; and they strongly recommend that in all cases they should be purchased in preference to the patent lines made from jute, which article has neither the strength nor the durability of flax, consequently cannot give so much satisfaction to the consumer.

They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.

They can be obtained of all Rope-makers, Ironmongers, Merchants, Factors, and Wholesale Houses in town or country. N.B.—Please note that all our goods as advertised above are labelled either inside or outside with our Trade Mark—The "ANCHOR."

WIMBLEDON.

For Congregational Church, Worpole Road, Wimbledon. Mr. W. D. CHURCH, Architect, 12 South Place, Finsbury.

	Church	Spire	Extra for Godalming Stone Facing

DRY WAINSCOT, over 1,000 Logs, in every thickness, up to 9-inch thick, 8d. per foot.

Dry Wainscot FLOOR BOARDS, inch, 7d. per square.

Dry "BLACK WALNUT," 1 1/2 inch, 9s. "

Dry TEAK and MAHOGANY, 8d. per foot.

T. FORMAN, Walnut Tree Walk, Lambeth.

MODELS made to Instructions for Architectural and Civil Engineering purposes, also litigated cases of light and air or other easements.—F. H. McLAURHAN, 19 Dalryell Road, Stockwell, S.W.

MORTAR MILLS, New and Second-hand.

Also ENGINE and STONE-BREAKERS.—Apply. S. MASON & Co., Machine Works, St. Margaret's, Leicester. Can be had on Hire, with option of purchase.

# LINDSAY'S IMPROVED PATENT REVERSIBLE TREADS & LANDINGS FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

In Hospitals, or places where it is desirable to be free from dust, the blocks can be placed close together, not leaving any cracks, so that the treads or landings can be swept or washed quite clean; also, if it be necessary to get light under a Staircase or Landing, rough glass blocks can be fitted in the Iron frames, side by side with the wood, and a subdued light thus obtained.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be re-filled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works,

13, 14, & 15 SOUTH WHARF, PADDINGTON, LONDON, W.

## PARIAN CEMENT. NINE ELMS BRAND.

MADE BY THE PECULIAR PATENT PROCESS.

Strongly Recommended, after 30 years' experience, for DAMP WALLS, on a backing of Portland, and as the ONLY SAFE CEMENT, capable of being PAINTED and PAPERED within 24 HOURS.

LARGELY PREFERRED FOR HOSPITAL WALLS & CEILINGS, BEING NON-ABSORBENT & NON-EFFLORESCENT.

### TESTIMONIAL.

37 NORFOLK STREET, STRAND, W.C.: April 9, 1880.

DEAR SIRs,—The Parian Cement which has been used extensively in St. Thomas's Hospital, and of which a large quantity was supplied by you, has given great satisfaction, and is, I believe, generally acknowledged to be the best material for lining the walls of hospital buildings. Its hard, smooth surface admits of being readily cleared, which I need hardly say is of great importance.

Messrs. FRANCIS & Co.

I am, Dear Sirs, yours faithfully,

HENRY CURREY, ARCHITECT.

Sole Manufacturers:—FRANCIS AND CO., VAUXHALL, LONDON, S.E.

### REPRINT OF ART PLATES FROM "THE ARCHITECT."

The following Illustrations, which have appeared in "THE ARCHITECT," can now be obtained in a separate form suitable for Framing.

A Coloured Reproduction, by permission of  
**THE FRENCH GOVERNMENT**  
OF THE  
**CELEBRATED FRIEZE,**  
**BY JULES DIDIER,**

Exhibited in the Salon in 1882.. In Nine Sections, price Sixpence each. Now ready. Sent by post, carefully rolled, price Sevenpence each.

May be obtained from all Newsagents or Booksellers, or at the

OFFICE OF "THE ARCHITECT," 175 STRAND, LONDON, W.C.

## THE UGLINESS OF TOWNS.

ALL towns, it is true, are not ugly. Neither, indeed, are the exceptions only such as to prove ugliness to be the rule. But it can scarcely be denied that English towns (leaving others out of the question), whenever they are worth looking at for their importance, are so seldom worth looking at for their beauty that the critic who pretends to anything like philosophical reflectiveness might not unfairly be invited to choose between two equally unpleasant conclusions—either that English civilisation has not yet reached so high a position as some people think, or that English civilisation and artistic feeling do not run together as they ought. To provide a way of escape from this little dilemma is not, however, our present purpose; we will go no further than to ask how far ugliness, or want of grace, is essential to modern town building, and by what means the introduction of a more presentable character may be most hopefully attempted.

It is of no use to allow ourselves to be persuaded by moralists of the more poetic or mystic order that the gracelessness of a great manufacturing or trading "centre" is the mysterious result of the inherent sinfulness or godlessness of man—that the steam-engine and the devil, in other words, have taken possession of the spot, destroyed the flowers of the field, shut out the landscape, and obscured with smoke the very sky, in order that the inhabitants may the better devote their bodily powers to the misery of toil, and their souls to consequent perdition. This may serve sufficiently well to attract the attention of humanitarians, in these days of hurryscurry and reading while we run, to a melancholy case; but it is not the way to promote that clear and correct view of the facts upon which alone the sober mind of modern society can be expected to proceed to an actual remedy. Let our first inquiry, therefore, be this—What is it that really produces ugliness, whether positively or negatively, in our towns?

The first answer seems to be that those conditions of modern business which bring about the development of a large town almost always induce the selection of a site, whether vacant or already partially occupied, which is in itself level ground, and which in most instances is also surrounded by comparatively level country, and through which, moreover, there probably flows a level and sluggish stream. In the next place, the same conditions are such as to produce in detail, in respect of building, designs and dispositions so wholly and urgently artificial that they disregard and virtually despise all those sentimental considerations which in better circumstances come to be so important an element in the handiwork of man. Even the art of beautifying the operations of building in the simplest way is thus a motive-power which in modern times does not come into any force till a late stage in the history of the town, and which then finds in most cases a very unfavourable basis to work upon. In the ancient world it may be said to have been otherwise; even as late as the middle ages an abbey, a noble church, or a castle, would from the first confer upon the surrounding settlement a higher character than its own, and indeed, in most cases, would once for all give an impulse of picturesqueness to the mode of building. But in our day it is a mill more likely than an abbey which has to be accepted as the nucleus of arrangement, and the rows and rows of mean brick boxes, with flat slate roofs and red chimney-pots, which are built in parallel ranks by lowest tender for the accommodation of the "hands," so emphatically postpone all questions of grace till a more convenient season, and so distinctly point to money-making and not pleasure-seeking, that the mere incidental repetition of the transaction financially becomes the very construction of all-pervading ugliness. Meanness of the meanest is the starting-point, and the whole course is meanness. Shops and warehouses, more mills and more cottages for the hands, churches and schools, offices of business and residences of ease, all are in their financial nature mean; ornamental in their way presently, no

doubt, but never gracious; recognising to the end the claims of individual profit passing into individual self-assertion, but never the superior claims of that public æsthetic gratification which, in all communities of sufficiently high culture, becomes, like moral order, the acknowledged law of individual action.

This is putting the case, we will admit, somewhat strongly; but it is the general principle of procedure which we are seeking to discern, and here it is; as we venture to think, plainly enough disclosed. The mere commercial element cannot be expected to produce grace in our towns; grace costs money, we are told; even if it only costs time, time to devise, time to choose, time to enjoy, that time itself is money. A popular writer gives an amusing account of his having been taken over an American "city" by one of its chief citizens. A number of avenues of most stately width and length converged upon a "place" of equal magnificence. But when the carriage had arrived at this central point, and while the municipal grandee was indicating with much pride the positions of the great public edifices and monuments, a wild cat sprang upon one of the horses and a wolf seized the other. The "city" existed as yet only in the form of lines marked out in the wilderness, and all its glories were to come. But let us not be content with smiling at the characteristic ambition of an adventurous village in the Far West; there is surely a better lesson to be learnt from the story. How is it that, even at this moment, in every important town in the British Kingdom, the provision which is being made for the extension of building is simply nothing? In a Western American village there is sufficient patriotic feeling to produce a public authority of some kind to control the future in the interest of order, and even to determine in good time beforehand such a scheme of judicious disposition as alone can effect a beneficial ultimate result. In continental cities, too many to be mentioned, the same description of authority governs in very much the same way. But in our towns at home there is absolutely nothing of the kind. It may be said that this want of system is part of the price we pay for liberty, and that the continental cities are "dragooned" or what not. But the Transatlantic communities are not dragooned, and we will say no more.

The more practical question before us is perhaps this. Given an English town, or a quarter of a town, which has been laid out and built upon principles confessedly ultra-commercial, and consequently in a certain meanness of spirit which is a negative, if not a positive, ugliness, what can be done to correct this very unsatisfactory character? There are whole regions, for example, in and about London, which are so palpably and wretchedly in this condition, that the casual visitor from what is only a less grievously afflicted neighbourhood in some other quarter finds himself wondering what can be done for the mere sake of the public credit for good sense. Can anything be done?

One thing that can be done is in fact now being done more than may be supposed. Whenever an opportunity occurs for building some prominent local edifice in a superior manner—a new church, for instance, a public establishment, large business premises, or even a row of new shop fronts—we may safely assert that it will always "pay" in one way or another to take the utmost care to have architectural design of the best with construction of the best. It need not be so much a matter of expense, but it is always a matter of pains. A few really good new buildings coming to be dotted about in a mean and neglected district will be found to give new life to the whole area, we may say new life to the inhabitants. The example will be followed in a variety of ways; sometimes in a very small way, and perhaps sometimes in an odd way, but the little leaven will leaven the lump, and we need only ask those who have the opportunity to try the experiment.

Another experiment which we confidently recommend—and we have only space to speak of this one—is this: that the owners of what may be called groups of small house property should enforce that kind of cleanliness and tidiness, externally to begin with, which makes all the difference in such cases between an aspect of poverty and one of plenty. This also will be found to pay. If rents do not rise in nominal amount, they will probably improve in actual security very promptly. But if it were of no further benefit than the improvement of appearances, the effect upon the spirits of the inhabitants must always be most beneficial. The dull artificiality of a meanly-built street may continue untouched, but, if cleanliness is next to godliness, tidiness may be a substitute for the picturesque.

Even a little paint will go a long way, and a cheap window-hanging will go much further. The ugliness of our inferior streets may still be denounced as a point of academical criticism, but even the most cynical of critics can afford to be a good deal less displeased, and all the more to conceal his displeasure, when he sees a little good taste in detail doing all that can be done as an apology.

## STUDIES OF SOME LONDON CHURCHES.

(Continued from page 64.)

AT the Church of *St. Thomas*, Lambeth, the work of the late Mr. S. S. TEULON, the chancel has aisles with compass roofs; arches on either side open out into the aisle, a kind of dormer roof being contrived in the latter, which enables the arches to be so much higher. There are shallow galleries to these aisles, and in the northern one the organist and singers are placed. This is not a bad idea for the position of an organ, instead of the ordinary organ chamber, but the singers ought to be on the ground-floor, not elevated above their fellow worshippers, as if they were mere performers. In this case there are no chancel seats, but only a prayer-desk with sides facing south and west. At the period of the writer's visit to this church, on a dreary mid-winter's day, a curious effect was produced by an open stove, the front of which was turned west not more than about some seven feet from the kneeling step. Consequently there was a glowing fire in front of the altar, reminding one of the burnt-offering of the Mosaic dispensation, but at the same time very distracting to the worshippers!

Not many yards distant is the *Roman Catholic Cathedral of St. George's*, Southwark, and thither the writer wended his steps, there being then no sacred function carried on. There are times and seasons when different effects are produced on the architectural mind, or, it may be, on other minds. It was not the first visit of the writer to PUGIN's work, but never was the interior more impressive than in the gloom and mist of this dark December day. The nave looked very fine, though it is deeply to be regretted that want of funds stopped the erection of vaulting, as the open-timbered roof is not properly "of a piece" with the rest of the architecture. The great rood under the choir arch standing out in front of the sombre distance of the space behind was very impressive. Of course the choir, for doctrinal and devotional reasons, is far more often lighted up with wax candles than left in darkness. A handsome screen, with or without a cross over it, is a great improvement to churches not only of the Roman but also of the English communion. The want of such a distinctive feature to separate nave from chancel is much felt in many a fine church. The beautiful geometric patterns of Roman mosaic in the nave passages of *St. George's* are far more effective than a tile pavement of richer design.

Could there be more of a contrast than in the alterations effected a year or two ago in two important London churches some way from each other—the one *St. Mark's*, North Audley Street, the other *St. George the Martyr*, Southwark? In the first a church which possessed no beauty of proportion or genuine architectural features has been transformed into a fine building, as if by the wand of the enchanter, while, ritually, all the proper arrangements for carrying on the services of the Church of England in a seemly manner have been made. In the second no structural alteration or material change in the fittings has been effected. However, when it is remembered that it was built during one of the duller periods of the life of the English Church (A.D. 1737) there is no cause for surprise. One ought to be thankful that the interior has been metaphorically warmed up and beautified by the application of the paint-pot, for the whole has been embellished in colour. The pews on the ground-floor and the gallery fronts are delicately decorated in a kind of Grecian style with grayish-white patterns. This rather tends to produce the effect of ivory inlay by its treatment; but the colour selected is not of the best. A warm buff ground would have given more the idea of boxwood inlay, and have been more suitable. It is also a great mistake to have thus treated the pews on the ground-floor in the same way as the gallery fronts. Alas! that we should have to speak of a church in a fashion which reminds one of a speculating builder's phraseology of "ground floor," "one pair," "two pair," &c. The colouring attracts too much

attention to a feature which in a church should be as retiring as possible. If painting a flat colour and gilding without any pattern had been adopted this would not have been so. The pew-doors happen to be nearly three times as wide as the pew ends, so that, though objectionable in principle, the doors could not very well be abolished. If the latter were swept away (and the remark applies to all pewed churches, not to this individual example) one may well ask what would become of the bland smile and the quiet "Good-morning" of the pew-opener, expectant of Christmas-boxes, to the seat-holder, the smile being given as if the greatest favour possible was being bestowed in admitting the hirer to his or her "box." However, there are free seats placed in a prominent though inconvenient situation in the centre of the nave, with a comparatively narrow alley on each side. This plan, a not unusual one, is fatal to all stateliness and ecclesiastical propriety, while, what is more important, it prevents a proper and seemly road for communicants up to the altar. The central passage would, too, look a fair width if even less than the dimension of the two narrow passages were added together. The colouring of the general ground-work of the ceiling is far too much like papering, and the border needlessly pretentious and out of proportion. There was no chancel arrangement, and the prayer-desk was much elevated, facing west. The organ and choir were in a west gallery, the top of the former almost touching the ceiling.

In plan, *St. Paul's*, Southwark, has a nave with clerestory and gabled aisles. The chancel has a semi-octagonal apse. There is a peculiar arrangement in the outer walls of the aisles—an unpierced arcade in which the windows are recessed, corresponding with that of the nave. But it is not intended for the purpose of throwing out an aisle hereafter, as is obvious by the plan of the responds. The effect of this feature is rather good, but it is not an economical device. Instead of the ordinary lead glazing in small quarries, large sheets of ground glass are used for the windows. This, as might be expected, has a cold and dreary look.

In the clever and, in many respects, beautiful Church of *All Saints*, Kensington Park, built in 1861, Mr. WILLIAM WHITE, with his usual enterprise, employed large sheets of glass, having patterns on them in quiet colours. But whatever advantage may have been expected by it, it does not harmonise with the architectural lines, and the ordinary quarry glazing is far preferable.

Though this article purposes to treat of churches, every rule has an exception, and the proximity of the well-known chapel of Mr. NEWMAN HALL, commonly called *Christ Church*, Westminster Bridge Road, to the before-named building induced the writer to peep into it. The first impression of a son of the Church of England, who most rarely puts his foot within the doors of a Nonconformist place of worship or a Roman Catholic church, was blank astonishment—astonishment that Nonconformists are so closely following in the paths of their Anglican brethren. The octagon in the centre, vaulted in wood, forms a very beautiful feature. Then there are nine steps up to the "chancel," which is of short length and has an uncovered table. There are stalls for the ministers, and the organ is placed on the north side in the ordinary way. There are painted glass windows, and a very large pulpit, reminding the spectator of those huge Continental examples more like a balcony, wherein the preacher can walk about and have plenty of room for vehement action and stirring eloquence. How extremes meet! In plain truth, this chapel is more like a Roman Catholic church than many Anglican buildings. There are many galleries, but this is not un-Roman, no more so than the hired-pew system, which unhappily is as prevalent in the Roman communion as in the English. The galleries, though not encroaching on the octagon, and well treated, unmistakably interfere with the internal effect. Still, taking it altogether, *Christ Church* is a work of great beauty, and has an interior putting to shame many of those of the Established Church.

The Church of *St. Saviour*, Warwick Road, Paddington, affords an example of gallery-front decoration which may be compared with one of the churches previously commented upon—*St. George's*, Southwark. The treatment is good, the panels ornamented with conventional representations of flowers in monochrome; the walls are scarcely decorated in colour at all, only sufficiently to harmonise with the elaborately-ornamented roof and other features. That painful appearance of crudity, rawness or cold, too often prevalent, is thus avoided. It is a

common notion that because roof or ceiling glows with colour the walls and other features underneath should necessarily follow suit. Whereas all that is desirable is that there should be some connection or harmony of the different parts of the structure which the varying circumstances of each particular case ought best to decide. The converse, however, is very different. Sometimes one sees properly ornamented walls teeming with figure subjects in decided tints and, overhead, a blank as far as colour goes. Need it be said the effect is disastrous to the eye educated as to what ought to be? A very handsome pulpit and prayer-desk have been placed in this church within the last few years, at the angles of both of which are beautiful little figures of apostles and saints. As regards a prayer-desk, it seems a pity to too much accentuate its sculpture. It may also be remarked that the junction between the carved superstructure and the stone base is too abrupt, and the stone figures against the wood background have a curious appearance; they do not seem to harmonise. The appropriate blending of two very different materials like wood and stone always requires great art and judgment in order to be successful.

A new apse to the chancel of *Holy Trinity Church*, opposite Portland Road Station, was added not long since. The only remark to be made about it is the peculiarity of the treatment of the chancel arch, which is of the same style as the church—Italian. There are pilasters against the east and west walls (the church, it should be mentioned, is not orientated, but stands with its axis north and south), but instead of these carrying an arch the whole width of the chancel, the bearing is judiciously sub-divided, two columns being placed a very short distance from the pilasters. Now this is a way of getting over a difficulty continually occurring, and which must occur in these days, when the want and convenience of wide chancels, well open to a perhaps wider nave, is so much felt. The objection that a pier or column of reasonable dimensions gets in the way, and obstructs the view in this situation, is surely untenable. It is very different from a range of columns in a nave arcade, where the vision towards the east is cut off at a variety of angles. In old examples, as at a church in Kent, is an arch with a triplet chancel arch, *i.e.* a wide one in the centre and a narrow one on either side, and in modern work, there is another instance at St. Antholin, Nunhead. A practical and constructional advantage is thus found; wide and lofty chancel arches, however effective, require considerable abutment, and in London and in confined sites it is not always possible to get this. It is a common Arab saying that “the arch never sleeps.” So if, instead of smaller arches flanking the central one, a system of corbelling over was adopted, the thrust would be proportionately diminished, and a somewhat novel, though perfectly legitimate, effect produced.

(To be continued.)

## PARIS NOTES.

LAST Saturday the definitive judgment in the competition for the Prix de Rome in Architecture was delivered at the Ecole des Beaux-Arts, the jurors being MM. Lesueur, Questel, Ballu, Garnier, Abadie, Bailly, Vaudremer, Ginain, Guénepin, Pascal, André, and Guadet. The subject given, as announced in last week's *Architect*, was “a mausoleum for the founder of a great state, his successors, and other worthies of the country,” and the prize-takers are: M. Redon, First Grand Prix; M. Quatesons, Second Grand Prix; and M. Deffrass, 2nd Second Grand Prix. Under a donation made by the Duchesse de Cambacérès, the winners of the 1st Second Grand Prix in the four sections of Painting, Sculpture, Architecture, and Engraving each receive the sum of 1,000 frs. The young artists benefiting by this liberal gift are M. Friant, pupil of M. Cabanel; M. Puech, pupil of MM. Jouffroy, Falquière, and Chapu; and M. Quatesons. As there has been no competition this year in engraving, the winner of the Second Grand Prix in 1884 will receive the sum of 2,000 frs.

The annual public meeting of the Ecole des Beaux-Arts has been fixed for October 20 next. Previous to this *réunion* an election will be held to replace MM. Felsing of Darmstadt and Ferstel of Vienna, foreign associated members, lately deceased. The sub-committee appointed to examine the various candidatures put forward has reported in favour of the following: (1) M. Mercuri, engraver, Rome; (2) M. Monteverle, sculptor, Rome; (3) M. Hausen, architect, Vienna; and (4) M. Geefs, sculptor, Brussels.

The public subscription opened to raise a monument to General Chanzy and the army of the Loire now amounts to 100,000 frs. The committee charged with the application of this sum has fixed upon the town of Le Mans as the most fitting spot for the erection of this memorial, and entrusted its execution to the eminent sculptors MM. Crank and Croisy.

In the competition for the design of the new Salon medal, the jury, after no less than five ballotings, adopted that of M. Daniel Dupuis, the second prize being awarded to M. A. Dubois, and the third to M. Bottée. The victorious design consists of a woman, seated, holding in one hand a palm, and with the other placing a crown on the head of an artist kneeling at her feet. Around the latter lie symbols of the various branches of art represented at the yearly Salons—a palette for painting, a hammer and chisel for sculpture, a broken column with its capital for architecture, a compass, rule, and square for drawing, &c.

The whole of the masterpieces by modern French painters in the Exposition de Chefs-d'Œuvre, now on view at the Georges Petit Gallery, are about to be engraved, and will be published in fortnightly parts, each devoted to one artist, and accompanied by a critical biography from the pen of M. Albert Wolff, the art critic. The first numbers will be devoted to Corot and Millet.

An exhibition of the works of the late E. Manet is about to be organised at the Ecole des Beaux-Arts by the members of his family, which includes the sculptor Lehnendorf, his brother-in-law. There was at first some indecision as to whether it should consist of only the completed and specially-characteristic works, or should comprise all his paintings, whether finished or not, drawings, sketches, pastels, &c. It has been decided to adopt the latter course.

The bronze figure symbolising the defence of Paris during the war of 1870 has just been placed on the pedestal in the Rond Point, at Courbevoie, where a statue of Napoleon I. once stood. It will be solemnly inaugurated on Sunday next, the 12th inst. The effect of the statue now that it is in position is not satisfactory. The groups appear too small for the granite pedestal, the summit of which is upwards of 13 feet from the ground; no carvings or other decorations, moreover, have been superposed to relieve the plainness of this great mass of stone, and certainly no picturesqueness is added by the simple iron railing that surrounds it.

The death is announced of the painter Cot, from inflammation of the lungs, after only a fortnight's illness. The best known works of the deceased artist are *Le Printemps* and *Pendant l'Orage*, which have been repeatedly reproduced.

A colossal winged statue of *Victory*, brought from the island of Samothrace, has lately been erected in the Louvre, on the landing of the great staircase of the Pavillon Denon. Some fragments had already been exhibited in one of the rooms on the ground floor. The figure has been reconstituted by M. Ravaisson, Director of Antiquities, but the head and arms are still wanting. It has been placed on the prow of a marble galley recently brought to France by M. Champoiseau, the French consul at the Piræus.

M. Germain Bapst, the learned bibliophile and collector, has returned to Paris, after fulfilling the mission in the Caucasus with which he had been entrusted by the Minister of Public Instruction and Fine Arts. He visited Georgia, Armenia, and Daghestan, being everywhere received in most cordial fashion by the Russian authorities, and has been enabled to bring home some archaeological and industrial specimens of great value. These will be placed in the Museum of Decorative Art.

The French occupation of Tunis has done something for archaeology. At last week's sitting of the Académie des Inscriptions et Belles-Lettres a communication was read from M. Cogniart upon the remains of Roman buildings and public monuments in the land of the Carthaginians. Many temples and other buildings have been lately discovered, for the most part in an excellent state of preservation.

**The Report** of the Improved Industrial Dwellings Company (Limited), states that the company now possess 32 estates in various parts of the metropolis, on which 4,144 dwellings have been erected and are in occupation, and 615 are in course of erection, making a total of 4,759 tenements. When these are completed the number of persons residing in the company's dwellings will be nearly 25,000. The expenditure on capital account has reached 814,890/.

## OUR LOSSES THROUGH CHURCH RESTORATION.\*

THESE meetings which we hold year by year in different parts of the country are not simply for our own instruction. We do, indeed, learn much by them; but, if that were our only aim, it would be better to travel more privately and in smaller parties. We come as we do that we may interest others in what interests us. We wish to spread the study of archæology, partly because we hold it to be a good thing for men to know something of what has been before them, and partly because the more the men who do so, the less is the likelihood of objects of archæological value being destroyed or allowed to perish for want of a helping hand from one who knows their worth. It is our custom to divide our work into three sections; and of these, that of Architecture, over which I have the honour to preside this year, seems to call for our missionary efforts even more than the others. It differs from them in that its subject is a fine art as well as matter for historical study. And it is most important to understand well and clearly the difference between the artistic and the historical side of architecture. Much harm has come to our old buildings from the confounding of them. A man cannot properly read the record of an old building without having some appreciation of its art qualities; but the converse is not true, and there are men whom we respect as architects or critics, whilst we are obliged to condemn what they do or recommend in their dealing with old work.

Next after actual writing we have in nothing so complete a record of the past as in its buildings. They are, as it were, history crystallised. Every age has built to suit its own wants and tastes, and we can learn of them from what is left. A building long in use has to tell us not of its first builders only, but of them who have used it all through its being. Domestic buildings tell us of the home life and public buildings of the common life of those who inhabited them. The latter being generally more lasting and less subject to change than the others have more to tell us, and of them those consecrated in religious use have most of all. Here in England the only really public buildings of great age which we have are our churches. But what a history is theirs! Beginning even before England was England, they have passed through their good times and their bad times, and are still in full life, and in truth more vigorous now than they have been for centuries. The contemporary of fifty generations has much to tell us. How, then, shall we bear with patience those who erase the old and forge new, until they leave nothing but a blurred and falsified record of one period only. That, however, is the ideal of the "restorers," even of those who make their boast that they are "conservative"; and if they have seldom quite reached it, it is because the record of the churches is so much a part of their very being that it cannot be altogether taken from them except by demolition.

But "restoration," bad as it is, is part of the history of the buildings. It is the chapter added in our own time. Their whole story is made up of changes, and what gives them their greatest interest is the fact that each generation of users has "improved" them, for good or evil, according to its own ideas. And in a living body this must go on. The great church revival of our time must needs show itself in the fabric, and it is useless for us to attempt to prevent it, even if we wished. But no true antiquary should desire to stop the life of a still living building. What we can and ought to do is to teach men how to value the old, and how to record the history of their own times without obliterating that of times past. Forty years ago the buildings were in a condition which can only be described as indecent, and the revival of life within the Church herself could not but produce some change in them. But that change need not have taken the form which is called "restoration." That it did so is due to the contemporary revival of the study of an old architecture, which study was quickly carried out to the furthest ends of the land by the archæological and architectural societies. The societies taught men to know something about the churches, and to distinguish in detail between, for instance, work of the thirteenth century and that of the fifteenth. But the knowledge was very imperfect, and the zeal of those who were showing the architectural merits of our neglected national buildings, and were striving to bring back the old style into actual use, too often made them regard as of no value everything which was not of their favourite style, and even, sometimes, everything which was not of the particular form of the style which they held to be the best. Thus grew the idea of "restoration" as we know it. In putting a church in order men aimed at making it a good specimen of what they called its "period," not knowing that in ninety-nine cases out of the hundred the church dates back far further than its history can be traced, and forgetting that modern imitation of old work cannot belong to any period at all except that which produced it.

We may admit that, looked at ecclesiastically, churches are now in a better state than they were. But even those which have passed through the hands of good architects have lost greatly in

value, and the much larger number less fortunate are mere wrecks. Now, I contend that the improvement might have been made, and in future may be made, without the mischief, for which, I repeat, the societies are chiefly responsible. There have always been a few amongst us who have known better, and the societies are not directly to blame for the worst barbarisms. But they have popularised the doctrine of "restoration," which, as interpreted by ignorant pretenders, has led to the deplorable results which we see. We need not be ashamed to confess our share in producing the evil, and the very magnitude of it may encourage us in attempting to stay it. The societies have raised the restoration fiend, and they must lay him. The adaptation of the churches to the needs of each generation of users is their very life, and, if it be properly done, it will still, as it has, aforesaid, add to their value. We cannot, even if we would, stop history, but we may do much to guide it. We must recognise the fact that even the worst of "restorations" generally come of a good motive. Parsons and churchwardens are not often mere barbarians, bent on the destruction of the buildings in their charge simply for mischief's sake. Their wish is to make them more fit for their high purpose, and if they do harm it is because they know no better, and those to whom they look for advice give them that which is worse than none. They "restore" the churches because they have been taught by precept and example that such is the proper treatment for them; and if we can teach them a more excellent way I believe that they will be as ready to follow it, whereas if we only rail indiscriminately at all alterations in old churches, we shall gain no hearing from their guardians. The first lesson to be taught men is that their duty towards an old church is not to "restore," but to preserve it; and this will generally best be done by showing them how it came to be what it is; how it grew from a perhaps much smaller building till it came to be what they now see; how each successive addition and alteration had a distinct use and meaning; and however the pedantic advocate of "period" may rail at it as a disfigurement or an innovation, is generally an improvement to the building.

Next show them that the building being many centuries old, the marks of age which it bears upon it are not defects, but honourable scars. Taking only the æsthetic view, the appearance of venerable age is far more pleasing than that of smart and shiny newness which the average "restorer" would put in its place. Defects which affect the soundness of the fabric must be made good, for both the present and the future use of the church require that it shall be kept in a state of sound repair. The maintenance or recovery of robust health are very different from a false and superficial affectation of youth. Judicious and necessary repairs will neither lessen nor falsify the church's record. But repairs which aim at bringing it back to the date which somebody thinks it was in at some particular date in its past are neither judicious nor necessary. As the changes of old always had a distinct end in view, either practical or æsthetic, so should it be with ours. We do no harm in adding whatever our convenience or our present sense of ecclesiastical decency may call for, provided that it be good of its sort, and make no pretension to be otherwise than what it is; and ancient objects of furniture where use still remains may and ought to be repaired if they need it. An old font, for example, may properly receive a new lining or a cover; but objects where use is obsolete—an Easter sepulchre, for example—should never be touched, except to preserve them from further harm than has already befallen them. The like, too, of tombs and monuments which have no practical use. The things belong to the past. Their record is done, and to "restore" them will only obscure or falsify it, and cannot add to the convenience, and will certainly take off from the architectural effect of the building. Our forefathers had not learned the historical value of buildings, and seldom hesitated to pull down older work to make way for that of their own time, which they believed to be better. We, however, who have learned it must be careful in adding our chapter not to erase former ones. Many works of the eighteenth century, and perhaps more of the nineteenth, both disfigure the churches and interfere with their proper use, but I would not have the record of even these entirely done away. Side galleries and box pews are degradations which we may be well rid of. But the fact that such things have been is not without its interest in the history of the church, although its nearness to our own time makes it seem the less important to us. A hundred years hence it will be difficult for men to understand how vast is the change which is being made in the second half of this century; and they who now press forward the improved state of things will do well to leave some evidence of what they have effected even if they can regard it only as a trophy of victory. But I believe that at no date has everything been absolutely bad. In the seventeenth century, and later still, our churches received much which served well both for their use and ornament, yet for years our "restorers" have been destroying these things, often putting very mean substitutes into their places, and for no better reason than that they are not "Gothic." Now, it cannot be too often repeated that it is not the architectural style of a thing, but its fitness to its place and purpose by which it should be judged. And, at any rate, a carved oak pulpit or screen of the time of Charles I. is, in every sense, nearer to the work of the middle ages than is a trumpery Caen

\* An address delivered at the opening of the Architectural Section of the Meeting of the Archæological Institute at Lewes, by Mr. J. T. Micklethwaite, F.S.A., President.

stone or varnished pine affair of the time of Queen Victoria, however "Gothic" it may be. Some men, too, have destroyed things for polemical reasons, which I cannot discuss here. But I would hint a man may renounce Lord Penzance and all his work, without taking away the board upon which his forefathers of the time of Charles II. and Queen Anne painted the Royal Arms as a witness of their loyalty to the Constitution. And the like also of some things in the opposite direction.

Men must also be taught not to despise fragments. Many a scrap which of itself seems almost worthless is most important to the history of the building to which it belongs, and the more precious as a fragment because it may be all that is left of an otherwise lost chapter. And there is another reason why such should be respected. I have said that the only safeguard for an old building is to teach its guardians to understand and value it. And a bit of old painted glass or sculpture, for example, which the general antiquary may regard lightly because he has seen better elsewhere, has a teaching power impossible to over-estimate. It is not enough for us to write books and papers. If we wish to make the lesson remain we must show examples, and examples near at hand, which men can study at their leisure. It is but empty talk to the many when we tell how the workers of old went on ever changing their style, first for the better, as the gathering experience of generations taught them more and more to know their material and their power over it, and then for the worse, when in the pride of craftsmanship they thought more of technical than of the artistic qualities of their work, and both sank together for want of the wholesome good of a noble aim, until the very art itself was lost. But let a man find in his own parish church what is described in the book, and the words have a meaning. The bit of glass, or whatever it may be, then at home in its place, and doing the work that it was from the first intended to do, will teach more and give more real pleasure than can ever be got out of the like piece stowed away in the museum of a great town, even to one who may have the opportunity to study it there, which the great part of those whom we would interest have not. Museums and collections have their use, for much would be lost if they were not. But after all they are necessary evils. They are the melancholy hospitals of the houseless orphans of art; and nothing ought to be removed to one of them so long as it has a native home of its own in which it may safely dwell.

Modern architecture is not a subject which concerns us as antiquarians, but I may be allowed to say a few words about it in so much as it affects the old buildings. One of the charges we bring against the "restorers" is that they deliberately strive to make their modern alterations such as may pass for old work, and so far as they succeed in their object they falsify the history of the buildings they treat by making it impossible to distinguish the real old from the forged old with which it is mixed. Some of the more learned pride themselves on reproducing not merely the old style, but minute local varieties of style. Now, the effect of all this is not to raise the new work to the dignity of the old, as they seem to think, but to lower the old to that of the new. It has ceased to be old and become a nineteenth century copy of old, none the less modern because worked up with the rest. There are parts which really are what the whole pretends to be. Thus the very skill and learning of the architect makes him a greater enemy to the building than even the ignorant and blundering pretenders whose doings have so often disgusted us. They indeed defile everything they touch, but if they do leave anything old it is still possible to recognise it for what it is. If whilst preserving the past history we are to carry it on to our time, whatever we do must show itself plainly to be of our time. The old builders in like case had no difficulty, for, as they worked in a traditional and always changing style, their work dates itself. But the old tradition has long been dead, and we have not yet succeeded in making a new one. I believe that it will come in the end, and that even now we are unconsciously working towards it. But meanwhile each architect must choose a style for his own use. He cannot invent one. No single mind ever did that nor ever will. And the frightful productions of the few misguided ones who have tried to do so in our time may serve as scarecrows to warn off others. A new style must grow out of what has been before, as all the old ones have done. Originality, when we find it, has not come of seeking, but the artist having new thoughts to express has moulded his style with such form as will express them. And so it may be new if, instead of troubling ourselves about pedantical correctness, and seeking excitement by trying first one style and then another, each man will select one which seems to him best fitted for modern purposes, and will then use it to express his own ideas just as he uses his mother tongue, neither violating recognised rules of grammar on one hand, nor in the other hesitating to introduce a new word or phrase where such is necessary to express his thought. Whatever new work we do in old churches must, as things now are, be in a style which we have learned by the study of old churches. Local varieties of style, too, deserve attention, for they generally have been influenced by the nature of the local materials. Let us use the old freely as a guide, but never reproduce it, and especially not copy in an old building details from its old parts, as has nearly always been done by the "restorers."

An old church often possesses articles which are as much parts of its history as the fabric itself. Amongst them the plate is the most important, and it is also the most of all in danger of being lost where the clergy and churchwardens are ignorant of its real value. A good work therefore for any society is to instruct them, and our friends of Cumberland and Westmoreland have shown us a most effectual way of doing it by their publication of a complete account of all the church plate in those counties. And I am glad to say that this example is being followed by other societies, and amongst them by that of the county we are now visiting. They could not do a better work, for nothing will make men value what is in their keeping so much as seeing that others care for it, and the fact that every article is known to be entered in a printed list will be a very strong safeguard against its alteration. Besides which, the work of making the lists is leading to many interesting discoveries. Already it has doubled the number of known examples of Mediæval English plate, and more are certain to be found, besides many valuable articles of later date at present unknown. The bells, too, have been catalogued in many places, and should be where they are not. The books and papers should be taken next, and either with them or with the plate should be noted these miscellaneous articles of movable property which churches possess, and amongst which are sometimes things of the highest interest. For the making of these lists we can only look to the local societies, and it will find them work for some time to come. But they ought to begin at once, for the destruction which they are intended to stop is going on daily. It is not long since the oldest English chalice known was sold from the church to which it belonged, and only saved from destruction by its fortunately coming under the notice of one of our members. It is now in the British Museum, where at least it is safe. But it would have been better to have left it in the church to which it has probably belonged for six or seven centuries.

Men particularly need to be taught the value of these movable articles, and that they should not be destroyed simply because they are out of fashion or past service. Let them get new and better if they like—it is well that they should do so, but let them keep the old for its own sake and the associations which belong to it. The metal of an old chalice is only worth a few shillings, which even the present parish need not grudge. Such things should not be stowed away out of sight, or left lying about where they are in danger of loss or injury, but carefully preserved in some safe place in the church where they can be seen by those who care to do so. Nor do I see why other antiquities should not be put with them there. I am sure that it is no desecration of an ancient parish church, full of history itself, to add to its other uses that of being the parish museum, and so let it extend the protection of sanctity to those few relics of which, ancient though they be, it is the still living contemporary.

## THE WELLINGTON MONUMENT IN ST. PAUL'S CATHEDRAL.

THE subjoined memorial, which has been signed by several members of Parliament, has been sent to Mr. Gladstone:—

1. That the late Alfred Stevens, an artist of acknowledged genius, designed a monument to the late Duke of Wellington, according to certain special conditions.
2. That the design was selected by Her Majesty's Government because it complied with those conditions.
3. That the monument was designed to be placed under one of the nave arches of St. Paul's Cathedral.
4. That the monument has been only partially carried out, and has not been placed in the nave, but has been relegated to the Consistory Court, on the south side of the cathedral.
5. That the full-sized model of the equestrian figure to surmount and complete the monument is preserved in the crypt of St. Paul's Cathedral.
6. That a wooden screen across the Consistory Court mars the effect of the monument, and prevents its being seen from the nave.
7. That the incomplete monument, therefore, stands on a site for which it was not intended, and where it is impossible to study its merits, or even to see the whole of the design.
8. That in the opinion of the memorialists, justice to the merits of a noble work of art and to the memory of the great Duke of Wellington requires that the monument should be completed, according to the intention of the artist, and that it should be removed to the site for which it was specially designed.

Your memorialists, therefore, pray that Her Majesty's Government will appoint a committee of experts to advise upon the completion of the monument, and its transfer to the site originally designated for it.

A memorial to the same effect, signed by artists and students of art, has also been forwarded to the Prime Minister, and a representation from the Royal Academy as a corporate body.

Mr. Marcus Stone, A.R.A., suggests that a reproduction of Stevens's monument, on a larger scale, and surmounted by the

equestrian statue, should be erected at Hyde Park Corner. There would be no difficulty in making an enlargement, and the melting of the old absurdity by Wyatt would furnish an ample supply of bronze.

Mr. J. R. Clayton writes in reference to the letter by Lord John Manners, which was published last week: It is quite true, as stated by his lordship, that at the time of the competition for this work he became "handsomely abused" for his selection of the design by Stevens. He does not, however, further explain that this abuse arose, not so much in impeachment of his decision in commissioning Stevens to execute his surpassingly fine design, as on behalf of other competitors who felt aggrieved on a side issue. These artists had, by the verdict of the judges appointed to award the prizes, won respectively the first and second places in the event, which was to Stevens a defeat.

This award, however, did not, by the terms of the competition, bind the Chief Commissioner of Works, who exercised a deeper foresight and his liberty of judgment by giving the commission to Stevens. At the result was expressed a good deal of irritation and the "handsome abuse" alluded to by his lordship. From this circumstance arose an unfortunate disposition to silence complaint and please everybody at all hazards. To this end the site for the monument was changed from beneath one of the spans of the nave arcade to the centre of the Consistory Court. On the piers of the nave arcade it was impossible to employ the malcontent artists, so to divide among three the loaf intended for one. The walls of the Consistory Court offered what seemed a convenient escape from the difficulty, not, however, without creating for Stevens another which followed him to the death. At either of the apse-like ends of the Consistory Court may be seen the result of this unfortunate compromise in the bassi-rilievi executed by the disappointed competitors for a solatium of 6,000*l.* This sum—so large a proportion—was deducted from the 20,000*l.* for which Stevens was to execute the monument itself. To aver that Stevens submitted to the condition of changed site is only to say that his submission was one of many which he had to make under "Hobson's choice." Thus the fund for his work was cruelly reduced; the surmounting group culminating his composition was denied him. He had to endure the destructive injury of Wren's screen in front of his work, to see his creation robbed of its due lighting, and to find it subject, from restricted space, to a distorting foreshortening which to any such composition could be nothing less than fatal. It may here be remarked that none of these influences, injurious as they were, induced Stevens to modify his design, upon which he had unswervingly fixed his heart and staked his reputation. The difficulty which Lord John Manners has expressed in reference to the sacrifice of the bassi-rilievi may be taken for what it may weigh against the main question. As regards the feeling of the Duke of Wellington, which all will respect, against the removal of the monument, His Grace would probably hesitate to urge such objections in opposition to the united verdict of the Royal Academy, the well-nigh unanimous voice of the art world, and expression of opinion in the House of Commons.

In reference to the suggestion in further compromise—viz., that matters might be somewhat mended if Wren's screen were moved out of the way—it is sufficient to bear in mind that a further instalment of "handsome abuse" would inevitably follow any such step. The screen in question is beautiful in itself; it is an integral part of Wren's work, and is companion to another *vis-à-vis* on the opposite side of the nave. Its removal, by which the lighting of Stevens's work would gain nothing, would not for a moment be tolerated by that large and growing section of the public which, while admiring the splendid genius of Stevens, knows also how to revere everything connected with the master-work of Wren.

### THE CALCUTTA EXHIBITION.

THE Executive Committee of the Calcutta Exhibition has issued a report of the proceedings at its last sitting. Mr. Joubert, the promoter of the scheme, asserts his belief that the exhibition will rank first in the list of similar undertakings in the East. Up to June 22, 104,450 square feet of space had been taken up. The period for receiving applications for space closes on August 15. Great Britain and her colonies occupy about three-fourths of the whole. Elaborate precautions are being taken for the security of the goods in the exhibition, and the question of their safe custody in transit is engaging the attention of the committee. A show of live stock, including exhibits from Australia, and from all parts of India, is to be added to the other attractions. The question of accommodation for visitors is (a correspondent says) a very difficult one, and will exercise the utmost energies of the committee. Houses are already being let at fancy prices, and the hotels are hardly sufficient for the ordinary winter incursion of strangers. There is some talk of forming a standing camp.

The Foundation-stone of a new hospital on the circular plan was laid last week in Greenwich, by the Earl of Dartmouth. Messrs. Young & Hall are the architects.

### NATIONAL PORTRAIT GALLERY FOR SCOTLAND.

ON the occasion of the banquet in February last of the Royal Scottish Academy, it may be remembered, says the *Scotsman*, that Mr. Maxtone Graham of Coltoquhey, in proposing the toast of "The Board of Manufactures," made the gratifying announcement that "a gentleman of great public spirit and patriotism had offered the sum of 10,000*l.* for founding a National Portrait Gallery in connection with, and under the management of, the Board of Manufactures, provided a similar sum was forthcoming from any other source." In approaching the consideration of the question how advantage might be taken of this handsome offer, the president of the Royal Scottish Academy and the other gentlemen who interested themselves in the realisation of it encountered difficulties, not so much in the way of meeting the monetary condition attached to the proposed gift by the generous donor, as in regard to the providing of a suitable building for the purposes of such a gallery as that contemplated. As the result, however, of negotiations which have been pending for some time, the Government have, we understand, not only indicated their intention of asking the necessary vote of 10,000*l.*, but have under consideration a scheme which has in view the transference of the Antiquarian Museum collection to the Museum of Science and Art, and the establishment of the National Portrait Gallery in the building thus proposed to be set free for the purpose. It is not, of course, intended to combine the two museums, and, while under the same roof, the direction of each will remain as at present. The Antiquarian Museum has long been hampered for accommodation, but as it is proposed to set apart in the Museum of Science and Art, shortly to be extended by a grant from the Government, two large rooms for the collection, Mr. Anderson, the curator, will be enabled to arrange it to greater advantage. The Antiquarian Society will, it may be added, change its place of meeting with the museum, and continue its career under the auspices of old associations.

### CRESSWELL AND SEIGHFORD CHURCHES, STAFFORDSHIRE.

THE members of the North Staffordshire Archaeological Society lately visited Cresswell and Seighford, when papers on the ruins were read by Mr. Charles Lynam.

At Cresswell, he said, the ruins consist of the east and north walls of chancel. Recent excavations have laid bare the outline of the little church in its entirety. It had only a nave and chancel of equal width and in continuous lines. The internal width is 18 feet; the length of chancel 20 feet; that of nave 30 feet. The thickness of the north wall is 2 feet 5 inches, and that of the east wall 2 feet 10 inches. The two fragments of walls are of two different dates. That to the north is of the Lancet period, and no doubt was erected with the rest of the church about the year 1200, or between that and 1225. This wall is pierced by two lancet windows, very small in dimensions, and having a square lintel inside spanning the splayed jambs. The lights are only 7½ inches wide, and 3 feet 4 inches in total height. They have the usual splay and square rebate externally, and a broad splay inside. The mortices for the stay bars to glass are just discernible, but the grooves for the glass can scarcely be traced. The precise junction of the flank walls with the rebuilding of the eastern wall with its abuttings are clearly marked, as the rebuilding was not substantially done, and the consequence has been that a serious settlement has taken place precisely at the line of junction.

The difference in the character of the work in the east wall from the other part is markedly clear. Its close-jointed masonry, angle buttresses of large projection, profile of string and base moulds, and its wide window opening, probably of four lights, all contrast with the broad-jointed masonry, broad and shallow buttresses placed square on the angles of the building, the simple splay to the base moulding, and the narrow slits of the windows of the original work. Much of the old masonry was reused in the rebuilding of the east wall, which has led to sundry anomalies in the work, but it was no doubt done at the end of the fifteenth century, whilst the whole church was destroyed, as proved by Mr. Whitby, very early in the succeeding century. Mr. Whitby has ascertained that a number of stones from the ruins were taken to a neighbouring weir on the river for the purpose of paving the waterway. This is still paved with stones, and if the church should at any time be rebuilt, the place whence the former stones of this sanctuary may be had will doubtless be borne in mind. There is another object of interest within a stone's throw of these ruins which may attract those learned in earthworks, and that is the long mound against the river, which certainly appears to be of artificial construction.

In describing Seighford church Mr. Lynam said: Seighford church at present consists of a chancel, nave, western tower, and north aisle. This latter is known as the Bowyer aisle, and out of it has been taken a vestry at the west end, to which there is an

outer doorway. The only general entrance to the church is in the west wall of tower. A priest's doorway to the south of chancel has been built up. Viewing the church from the main entrance to the churchyard at the south-west, one would at first sight be inclined to turn on one's heel and "move on," for from this point of view the principal objects to be seen are a Georgian tower and nave of brick, having perhaps a slight claim to some merit of dimensions and substantiality, but, architecturally, utterly depraved. Proceeding round the church from west to north, the Bowyer aisle and the east and west walls of chancel present historical details, which, to the careful observer, are of extreme interest, for in them are features of varying dates from Norman to Reformation times. On entering the church the north arcade of the nave, with the chancel arch, at once strikes the eye, and these parts are at the present time perhaps the most interesting portions of the building. First, it is seen at once that the work is Early Norman, and dates soon after the year 1100. Its massiveness, simplicity, and peculiarities of treatment of detail make this clear. Next, the variation in the plan and in the size of the pier of the eastern bay of the nave is remarkable. As a pier of a simple arcade it would be an anomaly; and looking at it carefully, and at its immediate surroundings, one is led to the conclusion that originally, in Norman times, the church was cruciform in plan, and that this pier received the cross arch east of the nave and that of the north transept, as well as the eastern arch of the aisle arcade. An examination of the external masonry of the north aisle fully confirms this view. It is marked by a distinct change in its character at this part. But this notion would, according to the present appearance of the nave from the church, involve the unlikely arrangement of a nave of only two bays in length. Go into the walled-off vestry, and another bay with its western respond pier is visible; so that it may be confidently accepted that the original church of Seighford was of Norman date and was cruciform in plan, and had a nave of three bays in length. The diameter of the nave shafts is 2 feet 6 inches, and their height 5 feet 6 inches, inclusive of base and capital, so that the shafts are only slightly more than two diameters in height; the bases and capitals are of early type. The chancel arch is the most ornamental feature in the Norman remains. Its nook shaft, elaborated mouldings of arch, and carved hood render it most effective in design. On two lead spout heads outside, one at the west and the other at the east end, is figured the date 1748, and the initials P. O. and I. B., C. W., which latter stands for churchwardens. At this date great alterations were made in the church. The tower was probably built at this time, the south side of nave was rebuilt, the whole of the roofs were probably reconstructed, and the pewing was put in. In short, the church was at that date what is now called generally restored. Though we cannot admire the taste with which these alterations were made, we must give credit to the spirit which animated their exertions, and, strange as it may seem, these brick buildings are the earliest efforts in the Gothic revival, for before the end of the reign of the Georges we find it developed to the extent exhibited in Stoke and other town churches in the Potteries. From the date of these buildings a single decade brought us to the time when Gothic architecture became predominant in church work, for since 1840 perhaps not one single-Classical church has been built; but another change is now spreading, and it is not unlikely the next new English cathedral may be of Classic taste. But to our more immediate subject. The next previous material alterations in the church were those made to the north or Bowyer aisle, when the four three-light windows and the four buttresses were put in. The alabaster tomb to William Bowyer and Mercy, his wife, now at the east end of this aisle, records the death of the former as in 1593, and it was about this time that this aisle was renovated. The original Norman church had, of course, a north aisle, as is manifest by the existence of the nave arcade; and there are fragments of the Norman walling, including the base mould still remaining at the west end of the north flank. Whether this aisle was continued east of the transept cannot now be asserted, but the remains of base moulding and string moulding at the north-eastern end of the chancel indicate that any aisle of chancel which there might have existed did not extend to the east gable as the Bowyer aisle now does. In the south wall of chancel is a two-light segmental arched window of about the date 1500, and in the same wall is a two-light window of somewhat earlier date, and another window of the same kind as this, just east of the priests' doorway, has been blocked up. In about the middle of the fourteenth century, in the north wall of chancel, two arches were placed, their outline being now discernible. These two arches have been taken out and one of hideous proportions—probably of brick—inserted. This was most likely done in the time of the great alteration in the middle of the last century. It remains now to consider what has to be said with regard to the chancel. That originally the chancel was coeval with the Norman church there can be little doubt, as the eastern arch of the crux still remains; but it would seem that about a hundred years after the original church was built the chancel was taken down and rebuilt, as the remaining walling, base moulds, buttresses, and string moulds are of about the middle of the thirteenth century.

Now we have reviewed the various structural features of this church as they appear in the building itself, it remains for us to

give brief attention to some of its minor points. Chief amongst these must be named the magnificent alabaster altar tomb (before referred to) of William Bowyer, Esq., and Mercy, his wife. On its top lie the recumbent effigies of the said William Bowyer and his wife, sculptured with rare art, faithfully giving all the richness of apparel and ornaments common to the date. At the west end are the armorial bearings of the two deceased. On the north side are the figures of four females, representing daughters of the deceased, and one son, and one figure swathed in cere clothes, perhaps signifying death in infancy. In a panel over the tomb in the north wall of the chancel are the armorial bearings of the deceased William Bowyer. No doubt originally this tomb was placed in the middle of this chapel, and this sculpture was at the foot of it. What remains on the other side cannot now be seen. This is one of many noble monuments to be found in this county, in themselves facts of history, but for the most part disregarded. May our visit to-day increase any interest that may be felt in the religious preservation of this precious relic. In this same chapel is a mural tablet of quaint device and inscription, to Edward Bowyer, Esq., and dated 1652. In the tower is an oak chest with the usual three locks upon it, and having quaint hinges and curiously-carved feet, bearing date 1620, and having the initials J. C. and W. C. (for wardens). At the west end is another mural tablet, bearing date 1628, recording the gift of 4/ out of lands by one Francis Chamberlin annually for ever. At the entrance two shelves are placed, bearing date 1767. On one is written, "For the use of the poor and stranger"; on the other, "Charity envieth not," so that the practice of making provision of books for strangers, sometimes followed nowadays, is not a novelty. The oak altar-table and pulpit, and cover to font and some pewing, are of seventeenth-century workmanship of good character. Some fragments of stained glass in the chancel, and some coloured decoration in the north aisle, are probably of the Bowyer tomb date. The glass is interesting. This inscription is plain, "Orate : p : bono : aia : uxoris eis." There is also the figure of St. Christopher, who, passing over waters, bears on his shoulder the infant Saviour; also a figure of the Blessed Virgin with the infant Christ. Her head is crowned, and his has a nimbus, with cross; also one female head crowned with long flowing hair; also two other female and one male head. All this glass is in brown line with yellow filling. The two fragments of glass in the east window have armorial bearings, and there are other small fragments in the window which has the figures on it. Every particular of this glass is very precious to all interested in archæological lore. In the north wall an early stone coffin lid has been inserted, and in a buttress in south wall is a tablet to Guli. Jorden, a former vicar, who died in 1738. In the chancel are several large marble monuments of the Eld family.

### THE CAVENDISH MEMORIAL.

THE design adopted by the committee for erecting the proposed monument to Lord Frederick Cavendish, on the South Nab, an eminence situated to the east of Bolton Abbey, is a massive square embattled tower, of Gothic character, affording a wide prospect of the surrounding hills and woods, the Valley of Desolation, the abbey ruins, and river Wharfe.

The monument stands on a rocky base, composed of the stone of which the hill is formed, so as to make it appear as natural an outgrowth from the hillside as possible; and it is approached by broad flights of stone steps, with a terrace and parapet at the base of the tower. The materials of which it is intended to construct the memorial tower will be obtained in the district, as far as practicable. The design selected was submitted by Mr. Thos. Worthington, F.R.I.B.A. (of the firm of Worthington & Elgood, architects, Manchester), under whose joint superintendence the work will be carried into execution.

### LONDON AND MIDDLESEX ARCHÆOLOGICAL SOCIETY.

THE annual excursion of this society was to Edgware, Whitchurch, Stanmore, &c., on the 7th inst. The Chandos Chapel at Whitchurch, with its decorative paintings by Laguerre and Verrio, were much admired, as well as the general appearance of the interior, which was explained by the rector, the Rev. J. B. Norman. Great Stanmore, with its ancient church of brick, in part remaining, was also visited, and described by the Rev. F. C. Jackson. The new church of Great Stanmore, close adjoining, was built some years ago, after the designs of Mr. H. Clutton. A short account of the manor of Edgware was given by Mr. S. W. Kershaw, F.S.A. (the hon. secretary), and Professor Hales and Mr. E. W. Brabrook commented on the ancient earthwork of Grimes Dyke, near Pinner. About one hundred persons, members and visitors, were present, and the meeting was one of the most successful and numerously attended for some years past,

## NOTES AND COMMENTS.

THE conditions of the new competition for the Science and Art Museum and Library Buildings in Dublin are now ready, and are to be had on application to the Commissioners of Public Works in Ireland. It is to be hoped that the various societies who possess an interest in the new buildings were consulted before the conditions were issued, for otherwise it may be assumed that opposition to the designs is inevitable. At the beginning of the year there had been no consultation, although the following resolution had been sent to the Science and Art Department: "The visitors of the Museum and trustees of the National Library desire to submit to the Government that no general plans for the new buildings should be adopted without previously obtaining the observations of the local bodies created expressly for the purpose of advising the Government in relation to the Library and Museum, as the decision on these plans will largely affect these institutions in respects which can best be judged of by local bodies." As no action was taken on the resolution by the Department, the trustees and visitors were compelled to express their regret that so much time was allowed to pass without any opportunity having been afforded them to offer observations on the scheme. This opposition between the Government authorities and the societies who will become the occupiers of the proposed buildings does not augur well for the new competition.

It is sometimes supposed that the science classes of the Science and Art Department are not attended by artisans. To ascertain how far it may be true Colonel DONNELLY, the director, instituted an analysis of some of the papers. Building construction and applied mechanics were selected as somewhat special or technical subjects, and, on the other hand, sound, light and heat, and magnetism and electricity as general subjects, in which there would probably be the smallest percentage of strictly artisan students. The result was as follows: In building construction 77 per cent. were operatives in the building trades, and among the remaining 23 per cent. were many clerks to builders, articled pupils to architects and surveyors; in applied mechanics 80 per cent. were operatives in the engineering trades; in sound, light and heat, 27 per cent. were artisans or the children of artisans; 18 per cent. tradesmen or the children of tradesmen; 19 per cent. clerks or the children of clerks; and 36 per cent. teachers, pupil teachers, and students at school. In magnetism and electricity the percentages in these several categories were respectively 30, 22, 18, and 30.

MR. ERNEST HART read a paper last week at Liverpool in which he advocated the necessity of provisions for the regulation of plumbers by local authorities. It was suggested that the names and addresses of all plumbers should be registered, and that no plumber should be allowed to carry on his trade until he had been registered and received a license from the local authority, the licenses to be renewable from year to year, and their continuance depending upon the licensee not having committed any gross infraction of the rules of the local authority during the year. The names of all licensed plumbers should be publicly advertised once a year by the local authority. The American system was also recommended for adoption, by which it is necessary that the plumbing and drainage of all buildings, public and private, should be executed in accordance with plans and specifications submitted to and previously approved by the local authority; that no drainage work should be allowed to be covered or concealed in any way until it had been examined and passed by the local surveyor; and that no new house should be allowed to be inhabited until the local surveyor's certificate was given. Moreover, a plan of the system of drainage must be appended to the lease or other documents for the letting of the house.

THE clerks in the surveyor's office in the city of York appear to possess rather enjoyable appointments, and many an architectural draughtsman must envy those young gentlemen. But play becomes expensive in course of time, and it is not surprising that the York clerks were therefore compelled to ask for higher pay. The Council, who have hitherto shown themselves to be easy-going masters, have not been liberal, as was anticipated, and, instead of an increase of salary, there is to be an investigation into the performances of the office. According to one councillor, who would seem to have been

behind the scenes, the clerks are so irregular that they have become "systematic in their irregularities." They take part in elections, they undertake work for themselves, they defy the surveyor, who is a model of every virtue, and have made his life intolerable. They are not afraid of excesses, and so little is thought of Council and ratepayers, that a young clerk does not hesitate to make use of one of the hundred-pound notes which are lying about the office. The councillor could not understand why there were no bonds in the office, meaning, of course, bonds of iron as well as of paper. It is a pity that there is a prospect of a change in so pleasant a place, but it is not impossible that, after all, the work in the surveyor's office may be much harder than the City Council suppose, and the investigation may be the means of obtaining better pay for the assistants.

DR. E. A. FREEMAN endeavoured to lay down the law of righteous restoration at the archaeological meeting at Lewes. Objects of the past, he said, divided themselves into two classes—those which could be used for present purposes, and those whose use had passed away. A church, a town hall, a house, and any object which was used in a church, a town hall, or a house, belonged both to the past and the present, and, as they could, they must reconcile the claims of the past and the present. On the other hand, there were other objects which belonged wholly to the past. No one would attempt to restore a cromlech, and he ventured to think that restoring a castle was as barbarous a thing as a human being could do. If anybody had seen the castle at Alnwick, in Northumberland, and compared it with Pevensey, they would soon see which was the better of the two. When it came to a town hall it was quite another thing. They must keep them for the present, and if they did not they were giving them up for the past. They must restore sometimes; but then came the question as to what limits and to what extent. Supposing in the middle of Westminster Abbey one pillar was giving away, and that this would allow the whole building to fall if the pillar was not rebuilt; he did not know if the great society who watched over their buildings would say, Let it fall, or, Don't put up a pillar like that again, but put up one unlike all the others. He thought architects would now say Let it fall, or prop it up with something which could not be taken for the old work; but he would ask if that was not going too far. Should they not make a pillar to match the others, and so not destroy the symmetry of the building?

ONE of the institutions of Dublin is the Botanic Gardens in Glasnevin, which now is controlled by the Science and Art Department. Botany is, however, a science which does not appear to find much favour from the authorities. The buildings containing the plants are falling into a ruinous condition. The palms are not to be surpassed by those at Kew, but the palm-house is in such a condition that any moment it may collapse. The roof-timbers are past repair, the platforms for visitors are dangerous, and the boilers leak. The museum is only a shed that is not watertight, the cases are of the worst possible description, and there is no provision for the preservation and mounting of specimens. For three years at least the officers have been vainly appealing to South Kensington for permission to undertake the requisite works. In a country like Ireland it is not wise to appear to give Government sanction to neglect and improvidence, as is now done at Glasnevin.

THE plan of lighting adopted in the life schools of the Ecole des Beaux-Arts, and which has been found to be successful, may not be generally known in English art schools. The room used for the study of the antique and living figure is furnished with an oil lamp of great power, having a reflector so placed as to throw the light fully and effectively upon the model, whilst over that portion of the room occupied by the students other oil lamps are arranged, having deep reflectors over and around them to throw light down and upon the works in progress. The seats of this room are continuous semicircles, and are arranged *en amphitheatre* to accommodate eighty students. The room set apart for students modelling in clay is capable of accommodating twenty-seven pupils. They work at posts with revolving tops fixed at equal distances apart, according to a semicircular arrangement, the studies being lighted by movable oil lamps and reflectors placed over and behind the students. The model is lighted in the same manner as in the antique room.

## ILLUSTRATIONS.

ST. PAUL'S INSTITUTE, BURTON-ON-TRENT.

THIS building has been erected at the sole cost of Mr. MICHAEL THOMAS BASS. Originally intended to be worked under one management, the subsequent alteration of this arrangement and the handing over of a portion of the premises for the purposes of a Liberal Club involved considerable additions and alterations, which have been in progress since the opening up to the present time. The portion of the building retained for the general use of the public comprises the public hall, three class-rooms at the west end, three ditto at the east end, kitchen, larder, wash-up, stores, and cellars under, with cloak-rooms and back offices. The remainder of the premises is in the occupation of the Liberal Club. The public portion of the building is also used for a Sunday-school in connection with St. Paul's Church (erected about nine years ago, also at the cost of Mr. BASS), the whole area of the hall and class-rooms being occupied for this purpose. The large west class-room is also used as a parish room, and the upper class-rooms for a children's library and other purposes. A penny bank is also accommodated. Every convenience for public dinners is provided, apparatus for cooking and serving up the most *recherché* dinner for 350 to 400 guests being attached to the hall, in addition to which is provided electro-plate, cutlery, linen, glass, earthenware, and kitchen utensils. The other sundries provided are portable tables convertible as high or low, screens, extra platform and proscenium for dramatic performances, and crimson felt for corridors and class-rooms, &c., and a dancing cloth sufficiently large to cover the public hall when used for public balls, upon which occasions the club premises are taken into use, and the reading-room converted for the time being into a supper-room. The public hall roof is panelled throughout in pitch pine, and carried on ornamental rolled iron ribs of Gothic outline and decorated; the interior walls are finished in coloured brickwork, in patterns relieved by stone pilasters, with carved caps carrying the ribs of the roof, the lower part having a dado 6 feet high of glazed red tiles between stone plinth and string-course. A large traceried circular window is introduced at the west end, and the orchestra and a fine three-manual organ in case designed by the architect occupies the east end. The organ is worked by water-power. Ventilation is provided by longitudinal iron gratings in the roof connected with the *flèche* in the centre, and fresh air is admitted by ducts in each window-sill above the dado. Heating is effected by hot water-pipes in the floor and roof. The floors of all the rooms are laid with wood blocks on concrete. The walls throughout—excepting the large hall—are rendered in Portland cement and finished in KEENE'S cement, and in the club portion of the building are covered with Lincrusta-Walton and richly decorated. The refreshment-bar is an arcading of three pointed arches on polished granite shafts and carved caps, and is fitted up with buffet at back and every convenience. The staircase is of Wingerworth stone, with iron balusters, and is most elaborately decorated. It receives light from a lantern roof panelled in pitch pine, and carried on stone shafts. The library is furnished with about 3,000 volumes, and the games-rooms with two billiard-tables and chess-tables. The club premises are furnished, and the floors lined with linoleum (granite pattern, solid through) throughout at the cost of Mr. BASS, including also 6 inch speculum telescope, two microscopes, &c., &c., by Mr. BROWNING, of London. The tower contains a four-dial clock, striking Cambridge chimes, and hour-bell weighing 19 cwt. (the clock being manufactured by Mr. J. SMITH, of Derby, and the bells by Messrs. TAYLOR & SON, of Loughborough).

The general contract has been carried out by Messrs. LOWE & SONS, of Burton, assisted by Mr. DE VILLE as joiner, and Messrs. PICKERING BROS. as plumbers. The fireproof floors are by Messrs. DENNETT & INGLE. Mr. F. STEVENSON has carried out the whole of the decorations. The pattern-glazing was carried out by Mr. S. EVANS. The entire of the tiled floors and walls have been supplied and fixed by Messrs. MINTON, HOLLINS & CO. Mr. E. H. COGSWELL acted as clerk of the works during a portion of the progress of the work. The whole undertaking has been carried out under the personal supervision of Mr. REGINALD CHURCHILL, of Burton, architect.

Since the building was formally opened, extensive additions have also been made to the kitchen department. The kitchen itself has been doubled in size, and fitted up with a large range

of gas-stoves, and an oven capable of heating 600 dinner plates at one time. A large, well-ventilated larder has been added; also a wash-up place, store-room, and large cellar, into which the blowing apparatus of the organ has been removed, the wind being conveyed by an iron trunk through a subway under the floors, a distance of about 80 feet.

The total cost, including land, &c., will not be less than 40,000*l*.

CANN HALL LANE SCHOOLS, WANSTEAD, E.

THESE schools have been built for the Wanstead School Board, in accordance with the requirements of the Education Department, and from the designs of Mr. J. T. BRESSEY, architect, of 70 and 71 Bishopsgate Street, E.C. At present the centre part only of the main building is erected, and it is intended to build the wings when the need for further accommodation arises. The school in its present form will accommodate about 700 children. The rooms are lighted principally from the north. A few south windows are, however, introduced to render the ventilation more easy and to make the rooms more cheerful. The work was carried out by Messrs. D. C. JONES & CO., of Gloucester, under the personal direction of the architect, Mr. PHILIP PORTER, acting as clerk of the works. The amount of contract was 5,980*l*., and the works were carried out for that sum. In addition to the schools themselves, the contract comprised boundary walls, iron fencing, latrines, formation of playgrounds, and a caretaker's house.

ALFRETON ROAD BOARD SCHOOLS, NOTTINGHAM.

THESE schools have recently been built for the Nottingham School Board, at the junction of Alfreton Road and Bentinck Road, the two roads forming an obtuse angle, the apex of which has been utilised on plan for caretaker's residence of two storeys in the height (16 feet) of ground-floor of main building, with board-room for managers' meetings over. The girls' and infants' entrance is situated on main front, and the boys' entrance from back street. The accommodation provided (this being a "mixed" school, and largely used for half-timers) is for 480 "senior mixed," 210 "junior mixed," and 300 infants, being a total of 990 scholars. The schools have been planned to permit of the future erection of two large additional class-rooms. When this is done, 1,110 children will be provided for. The materials employed were local red brick, with Hollington stone dressings, Bangor slates, red ridge, &c. The contractors were Messrs. WHEATLEY & MAULE, of Nottingham; the architect was Mr. A. H. GOODALL, of Central Chambers, Nottingham; and the clerk of works, Mr. JOHN PRICE. The total cost, exclusive of land, was 8,632*l*. 12*s*. 4*d*.

HOUSES AND SHOPS, ST. MARTIN'S HILL, FOLKESTONE ROAD, DOVER.

THE fronts of the buildings shown in the illustration are of yellow stocks, with red brick angle shafts, bands, arches, &c. The weatherings and lintels over shop-fronts are of buff terra-cotta. The roofs are covered with red tiles, with plaster eaves and cornices, and the latter painted white. The red bricks, tiles, and terra-cotta have been supplied by Messrs. JOHNSON & CO., Keymer Junction Works, Burgess Hill, Sussex, and the quarry glazing by Messrs. GIBBS, HOWARD & CO., Fitzroy Square. Owing to the Military Hill at back the site is very cramped, and necessitated special planning. The works have been successfully completed by Messrs. AUSTEN & LEWIS, of Dover, from the designs of Messrs. FRY & BROAD, of Dover and Deal.

SKETCHES OF EVESHAM.

THE little country town of Evesham is situated in one of the most beautiful and luxuriant valleys in the south of England. Picturesque streets, abbey buildings, interesting churches and houses, historical associations, are all found there. The river winds round the town, forming a tract of land shaped like a horse-shoe, on which, at an early date, a monastery was established. It was in A.D. 709 that EGWIN, third Bishop of Worcester, founded an abbey. In the entrance gateway to the churchyard, and in other parts of the town, are found remains of Norman work attributed to WALTER the Monk, abbot in the reign of WILLIAM I. The remains of the old abbey are but scanty. The north wall, the richly-sculptured archway over the entrance to the old chapter-house, and

the almonry and kitchen are the most interesting. Most of the church work still remaining was, however, executed in the sixteenth century by CLEMENT LICHFIELD. To him is due the magnificent bell-tower, also the greater portion of the churches of St. Lawrence and All Saints. This great architect and monk ruled from 1513 to 1539; in the latter year the abbey was dismantled. The Church of St. Lawrence was dedicated in 1295; very slight traces of the original foundation are now visible. The east end is a fine specimen of Perpendicular work, and the double range of panels below the window on the outside, with rich and delicate angle buttresses, are particularly good. LICHFIELD's chapel, open to the church by a large panelled arch, has very rich fan tracery vaulting, a fine pendant, and very good windows. The somewhat patched Church of All Saints contains another chapel by LICHFIELD, of similar design to that in St. Lawrence. The entrance porch is an interesting example of late Perpendicular work.

But it is for its stately and finely-proportioned bell-tower that Evesham is celebrated, and from it Sir CHARLES BARRY derived inspiration for the tower of the Houses of Parliament. It is 117 feet high and 22 feet square at the base. It is proportioned into three parts, and is richly panelled from top to bottom on the two principal fronts. At each angle are two buttresses, divided into five stages above the base course, each stage diminishing in height. There is a fine ogee archway, above which is a six-light traceried window, both having a beautiful label and finial. The top stage, on the main fronts, has two double-light belfry windows. There are richly ornamented angle and central pinnacles, with an open panelled parapet. The excellent proportions and situation, accompanied by good detail and pleasing colour, make this tower indeed a grand study for the thoughtful student.

### THE ROYAL ARCHÆOLOGICAL INSTITUTE.

THE annual meeting of the Royal Archæological Institute commenced at Lewes on Tuesday in last week. The president of the meeting was the Earl of Chichester, who delivered an address, in the course of which it was said that the chief use of archæology consists in the illustrations which it often affords to regular history, which is at the best but an imperfect record of the past. His lordship referred to the discovery of ancient remains in the course of the construction of the line through Southover. When the London and Brighton Company began their useful but destructive works they invaded the site of the venerable Cluniac Priory of Southover. A more barbarous invasion under Henry VIII. and Lord Cromwell had completely devastated the beautiful church and other buildings of the priory. The second invaders were, however, more pitiful, for when excavating through the site of the church they came upon the altar steps and the church floor, and found two small leaden boxes, which were proved to contain the remains of the founders, William de Warrenne and Gundreda, the Conqueror's daughter. These precious relics were, by the railway authorities, immediately placed in the custody of Lord Chichester, and his lordship had the satisfaction, with the aid of archæological friends, of being enabled to erect a small chapelry in Southover Church, and to place in a plain but suitable tomb the illustrious bones, which, it is to be hoped, will now remain undisturbed by any future Cromwell or railway excavators.

The first building visited was Lewes Castle, which was described by Mr. Somers Clarke. The barbican, he said, had been more recently built than the castle. The keep was, he said, in some respects one of the most curious in England. There was not so much left of it as people could wish, but what there was threw a great deal of light on the style of structure common in that day. It was usual to throw up a mound or take advantage of a natural one. Round the mound was a mote, and the ditch was the parent of the mound. There were sometimes one and sometimes two keeps; where there was one, it was sometimes built in the centre, and sometimes at the ridge of the mound, as in this case. The enclosure began from the outside ditch, and generally included about a third of the mound. Before the time of the Conquest masonry was little used for purposes of defence. Those mounds which were artificial were, of course, not fit for a long time to support a building of stone and mortar. As far as he knew, there was only one of these old military buildings in England in which masonry appeared to have been introduced before the Norman Conquest (Corfe Castle). Arundel Castle was spoken of in Domesday as existing before the time of the Conquest, but he had failed to find any traces of it; if there were any they must be in the vaults not usually shown. When the Conqueror came over he left very few masonry castles behind him, and he found none here. Most probably timber was used for defensive purposes. The

Tower of London, although standing on the old Roman walls, was a Norman building, having been erected by the Conqueror. The whole of the policy of William was to put new men into the old sites, and leave them to fortify themselves; each baron seemed to have been left to build what castles he could, and as the mounds were strong, they were generally content with the fortifications which existed; the new fortifications were built elsewhere. The shell keeps were for the most part late Norman rather than early, but this at Lewes was early Norman. Here, too, nature had provided two mounds, this and the Brack Mount. Undoubtedly this was the keep, but it was clear the Normans could not leave the Brack Mount undefended, or the enemy would at once have seized it, and well it was for the fortification that so strong a man as de Warrenne came there, as he had a sufficient garrison to occupy both. But there were not two keeps; this was the keep, and the other erection on the Brack Mount was subordinate to it. It was a curious thing that when de Warrenne came over here he must have been perfectly familiar with the fortifications he saw. The speaker having remarked upon the fact that at Guildford the Castle keep was built partly on the plain and partly on the mound, said the cases in which Norman square keeps were placed upon the mounds were exceedingly rare. Mr. Clarke next pointed out that recent excavations showed that four side towers were additions after the original erection, the walls not being in any way interlocked, and further said that these excavations had also thrown some light in a manner on the keep itself, and prevented him building up a theory which would have been destroyed by facts. Generally archæologists were careful in forming theories to do so where facts could not be brought in proof against them, but in this case no doubt the erections to which he had referred, and which had made him quite ready to set up a theory, were the work of the late Mr. Kempe.

An elaborate paper on "The Battle of Lewes" was afterwards read at the Castle Banks by the Rev. W. R. W. Stephens. At the evening meeting Dr. E. A. Freeman delivered an address, as president of the Historical Section, on the history of Sussex.

On Wednesday Pevensey, Rye, and Winchelsea were visited. Dr. Freeman described Pevensey Castle. Unlike the castles of Bath and Chester, it had, he said, never been restored. He had no doubt that if excavated many precious things would be found, just as was the case at Silchester. So late as the reign of Stephen the sea came up to the walls of the fortress. Dr. Freeman pointed out that the most ancient part of the ruins, the outer walls, were of the common type of Roman wall, composed of flint, with bonding-courses of brick—a kind of wall seen everywhere except in Rome.

Mr. J. T. Micklethwaite described Pevensey Church. It was, he said, a question whether the building was really what it appeared to be, or whether the work was of modern insertion. Everything he had seen appeared to be modern; but if it were old, the building had grown from an old cross church. The church was entirely rebuilt during the thirteenth century, and it appeared that the work was carried out at different times, for they began with the chancel, and built it longer in comparison with the size of the body of the church than they would have done had the whole of the work been in hand at once. The tower was in the middle of the church instead of at the west end, and this plan was seldom adopted, as it was very inconvenient. The chancel was much narrower than the nave. In the body of the church were two little niches for figures, which people in the fifteenth century were very fond of putting up for the reception of votive offerings.

Westham Church was next visited. The Rev. H. Hopley said it was a grand old church, which exhibited different stages of architecture, some portions of it being undoubtedly very early Norman, probably contemporary with the castle. Some of the work was Early English, of which the arch leading to the west tower was a fine example. The roof was supported on double corbels, which was unusual. The chancel was of the time of Henry V. The stained glass in it had apparently been taken from other parts of the church.

Ypres Tower, at Rye, now used as a gaol and police-station, was described by Mr. Vidler. It was built, he said, by William of Ypres, who was created Earl of Kent by King Stephen. Ypres Tower is a quadrangular building, with a round tower at each corner, each tower being about 25 feet in exterior circumference, and 15 feet in the interior. There are two rooms in the building, one on the ground floor and one above, each 15 feet square. There is a door at every corner of each room communicating with one of the towers. There are stairs only in the north-east tower, and these do not reach to the top. In the north-east and north-west towers are severally four lancet windows, two up pretty high, the other two lower. In the south-east and south-west ones are five windows—three towards the top and two below; two old windows in south face between the towers, and one in the west. The walls are four feet thick, and the towers about 40 feet high. In 1837 a new building was added on the south-east side of the tower, for the purpose of enlarging the gaol.

The parish church of Rye was described by Mr. Somers Clarke. It is cruciform on plan: the building shows very distinctly how it has grown from a small church to its present very considerable dimensions. The centre tower was no doubt originally Norman, and it still retained within it Norman work, but the arches in it

have all been enlarged; those leading into the transepts are of fifteenth-century work, those into the nave are Transitional. In the north and south transepts there are traces of late Norman and Transitional work on the western walls. The external wall of the south transept shows very distinctly some of the Transitional or late Norman work. The nave is a fine example of Transitional work in its arcades. It is somewhat curious that although most of the columns are round, one on each side is octagonal. The aisles were evidently enlarged late in the fourteenth or early in the fifteenth century. The west window is an insertion of the late fourteenth-century date. A piscina exists in the north wall of the north aisle, indicating that a chapel must have stood screened off in this position.

Winchelsea was the next place in the programme. Mr. Micklethwaite described the church as unique. In these old commercial towns they usually found a small church had been built, and this had developed into a large one. Winchelsea was one of the few places in which a church had sprung fresh out of the ground, or had begun to spring, for this was never finished. When the place was prosperous they began to build an ideal parish church, and were not hampered with old Roman buildings, as in most places. However, misfortune overtook the town, and it was never finished. The chapel to the right of the main entrance had doubtless been the seat of some important guild, and on the other side of the church were effigies brought from the old church—the church at Old Winchelsea—with canopies erected over them. These effigies were considerably older than the church itself. The style of the church was Decorated, and he did not think the roof had been intended to be the permanent one. The church had remained a fragment, and he hoped it would continue to do so, and that no one would take the idea into his head to build a nave and transept. The ruins of the Friars' Church were described by Mr. Freeman. In the evening Mr. Micklethwaite delivered an address at Lewes, and a paper on "The Architectural History of the Cluniac Priory of St. Pancras at Lewes" was read by Mr. W. H. St. John Hope.

Thursday was an important day, for Hastings and Battle were visited, under the direction of Dr. Freeman, who read passages from his "History of the Norman Conquest." A *conversazione* was held in the evening, at which a paper was read by Mr. R. S. Ferguson on "The Dignity of a Mayor." Having described municipal insignia, he said that as regards robes he could give no information, and lay down no rules. He was one of the few mayors who possessed no robe, and he rather congratulated himself thereon. He was utterly unprepared for the gorgeous spectacle presented by his brother mayors at the Mansion House in 1882. Every variety of material, of colour, and of pattern that the wildest imagination of the tailor could devise was to be seen.

On Friday the annual business meeting was held, and it was resolved that the next meeting should be in Newcastle. An address was delivered by Major-General Pitt Rivers on the excavations at Cissbury Camp and Mount Caburn Camp, which were supposed to have been British fortresses. In the afternoon, under his direction, Mount Caburn was visited.

The first place visited on Saturday was New Shoreham. Dr. Freeman in describing the church, said that the true way if one wished to understand a structure was to look at the outside, and then to go in and examine it more in detail. He had been advocating this course for many years, but mankind was too strong for him, and people would still go on looking at the inside of every church or building they came to. Almost everyone would say the remains of a very fine conventional or collegiate church of the second order were here. Inside and out there was every sign of there having been upon the spot a minster. It was simply a parish church, one, he believed, of a type absolutely unique in England, with the exception, perhaps, of the Church of St. Mary Redcliffe, at Bristol, which in some respects was like it.

Mr. Micklethwaite afterwards described the spire of Compting Church, and Mr. Somers Clarke the Church of St. Mary, at Broadwater. Then the party journeyed to Arundel, where the castle was thrown open to the members.

On Sunday a sermon was preached in All Saints Church by the Archdeacon of Lewes. Chichester Cathedral was visited on Monday, and was described by Mr. Gordon M. Hills.

## THE PRINT ROOM, BRITISH MUSEUM.

THE contemplated appointment of Mr. Sidney Colvin to the keepership of the Department of Prints and Drawings in the British Museum is now completed. The *Times* says that circumstances rendered a change in the administration of the department almost indispensable. The method of dealing with the rough materials for a general catalogue of the collections had to be carefully considered, and the direction and execution of the work to be minutely superintended. The approaching transfer of the collections to a new set of rooms had to be prepared for, and it was seen that it must be followed by an increase of the staff, requiring careful selection of candidates and general reorganisation of the department. What was urgently called for is obtained by the new appointment. Mr. Colvin's scholarship is well known,

and he may be safely trusted with the task of both planning and revising the necessary catalogue or catalogues. His capacity for administration has been tried and proved in his direction of the Fitzwilliam Museum at Cambridge. Under his government the Department of Prints and Drawings may be expected to undergo a thorough course of reformation in every respect and with the best results.

## SAN TOMA, VENICE.

MR. HENRY WILLIS has described his success in rescuing a rare and precious specimen of fifteenth-century art from the spoiler. He says: Readers who have explored the more out-of-the-way nooks and corners of Venice will remember the little Piazza San Toma. It lies almost under the shadow of the Frari. At one end stands the church of San Toma; opposite to it is a fifteenth-century building, formerly the guild-house of the shoemakers, now a furniture warehouse. The sides of the piazza show little of architectural interest, further than here and there a picturesque window, or an occasional piece of stone carving. The real point of attraction in the piazza is the door of the guild-house, with the beautiful bas-relief that surmounts it. A glance shows the student of sculpture that it is a fine example of Lombardi work, possibly by the head of the school. It is set in a decorative border, and is in very low relief; the traces of colour have settled down into a prevailing warm tone, throwing a haziness and dream-like character over the composition, entirely in harmony with its old-world subject and sentiment. The figures represent St. Mark curing a shoemaker who has wounded his hand with his awl. The shoemaker is dressed in turban and Turkish costume; he is seated cross-legged on the ground, and is surrounded by the implements of his craft. The saint, a noble and dignified form, stands before him; he holds the wounded member in his right hand, his left being raised in benediction. Few modern sculptors would elaborate the background of a bas-relief to the same extent as in this slab, yet the towers and palaces now in detract from the presentation of the figures. I believe the legend runs that the shoemaker cured by St. Mark embraced Christianity, attained the honour of sainthood, and that his bones lie in the church on the opposite side of the piazza. Those unacquainted with the bas-relief, but knowing the Scuola di San Marco adjoining the church of SS. Giovanni e Paolo, will recall to mind a similar subject by Lombardi on the façade of the Scuola. Both are of the same date, and show affinities of design and treatment; and if the slab of the guild-house is not from the hand of Lombardi himself, it may well have come from his workshop.

Happening during a recent visit to Venice to pass through the piazza, I stayed for a minute in front of the doorway. Presently I was accosted by the furniture dealer, who, in the course of conversation, informed me that a "milord Inglese" had offered the landlord of the premises a large sum for the bas-relief, but that they had not yet come to terms. A day or so afterwards I was at the show-rooms of a dealer who had a piece of sculpture from a Venetian door-head on sale. He mentioned that he had his eye on a similar specimen of *quattrocento* work, and which he hoped to secure. Describing the slab, I at once recognised the masterpiece of San Toma. Having arranged to leave Venice on the following day I could only lay the case before some Venetian gentlemen, who have been earnest in opposing the spoliation, as well as the so-called restoration, of their native city. I ventured to suggest it might be possible to induce the municipality to purchase the bas-relief and to maintain it in its present position. I have lately received a letter from a Venetian friend stating that the owner of the property had been applied to, and when he was made aware of the artistic importance of his doorway and the interest it excited he very generously promised that it should remain intact as long as his tenure of the property lasted.

The letter went on to say that although this wanton destruction of architectural monuments, this tearing away of ornamentation that loses much of its beauty and value when dissociated from the spot for which it was designed, is done at the instigation of dealers—antiquarians they are called at Venice—yet that much of the blame attaches to those English collectors who with long purses in their pockets tempt the cupidity of the dealers, and often, indeed, incite them to the work of destruction. A picture, a majolica dish, or a bronze may be a legitimate object of purchase. If a church be demolished its carving and columns, its metal and wood work, naturally come into the market. But to strip a building of the decoration that has made it an object of regard for successive generations, that leaves an unsightly gap in what otherwise may be a pleasant street view, or possibly even one of the points of interest in a world-famous city, is an offence for which no excuse can be found.

It is not, however, English "milords" that are alone to blame in this matter. The British collector now finds a potent competitor in his American cousin. A similar case to that mentioned above came under my observation a couple of years ago at Antwerp. There, also, I happened to turn aside to glance at a well-known piece of sculpture crowning an antique doorway, which must have been familiar to many of your readers. It represented

a St. George fighting the dragon. Finding nothing but a blotch of rough plaster I made inquiries, and was told that a short time previously an American had persuaded the proprietor of the house to sell him the bas-relief. Instances like these are common enough to visitors to the older Continental cities. Fortunately, there are few collectors who would allow their mania to carry them to such lengths; but many will not refrain from buying objects of this nature from a dealer's showrooms. They might remember that when the demand stops then, too, will the wreckage cease. They should also remember that it is not only *quattrocento* bronzes, pictures, and majolica that are being fabricated to any amount at the present day in Italy.

Not the least gratifying circumstance connected with the saving of the San Toma sculpture is the fact that it was accomplished by Venetians. It gives promise that a public opinion is being created at Venice which will arrest this ruthless wrecking of house-fronts, as it will oppose the equally disastrous restoration of churches and palaces.

### THE IPSWICH CORN EXCHANGE.

A MEETING of the Ipswich Town Council was held on the 1st inst., when the following report from the Post Office and Corn Exchange Committee was read: Pursuant to the resolution of the council (in committee) on the 14th inst., your committee beg to report that they have had an interview with Mr. Binyon with reference to the extra works which had been ordered by him without the knowledge or sanction of your committee. The cost of these works was 1,710*l.* 10*s.*, and on this account Mr. Binyon was legally entitled to claim his commission, but in order to facilitate a settlement he has consented to forego such claim. Your committee recommend the council to sanction the payment to Mr. Binyon of 288*l.* 5*s.*, being the reduced amount agreed to be accepted by him in discharge of his account, as shown by the following statement:—

Total amount of contract and extra works	£	25,575	9	d.
Less cost of extras above named		1,710	10	0
	£	23,864	19	2
Commission of 5 per cent. upon 23,864 <i>l.</i> 19 <i>s.</i> 2 <i>d.</i>		1,193	5	0
Less seven payments made on account		905	0	0
Balance now payable	£	288	5	0

The report was adopted. One of the aldermen said that he had had the impression that they were not responsible for anything the architect ordered without their sanction; but they found the architect was independent, and had entire control. He hoped they would gain wisdom, and next time take care to have such provisions in the contract that they would not be again involved in such heavy cost.

### HOSPITAL CONSTRUCTION.

A PAPER was read by Captain Douglas Galton, C.B., F.R.S., upon hospital construction at the conference of the British Medical Association in Liverpool. He said: An hospital is not only a place for the reception of the sick poor; it has, so far as the community is concerned, a far more important function. It is the technical school in which the medical student must learn his profession, and it is an experimental workshop for the matured physician or surgeon. In order that the effect of the curative art may be studied under the most favourable circumstances and without disturbing causes, it becomes necessary that the hospital building in which the patients are lodged should be placed in the most favourable hygienic conditions, and furnished with the most complete curative appliances. Therefore, whether the hospital be looked upon as a place for the relief of misery or as a place for education, the same necessity prevails of making it as perfect as possible.

So far as the site is concerned, it would be preferable if it were possible to place the hospital on the outskirts of a town, where houses are widely distributed, for it is certain that the larger the open space round hospital buildings the better. On the other hand, it is necessary that hospitals should be within reach of the population for which they provide, because there are many cases which must materially suffer from conveyance to a distance, and they must, moreover, be accessible to the leading physicians and surgeons of the town, who necessarily reside in the centres of population. These centres of population consist often of districts closely built over, which are under questionable sanitary conditions, and where the circulation of air is often much impeded. It is, therefore, necessary to consider not only what is likely to be the effect of the surroundings upon the health of the hospital, but what will be the effect of the aggregation of disease in the hospital on the surrounding population. It is difficult to find examples of recently-erected town hospitals the air-space round which is restricted entirely to the ground on which they stand. I observe in the plan of the ground proposed to be

acquired for the new hospital in Liverpool that the area, extended to Pembroke Place, is about 200,000 square feet; and assuming that the hospital is to accommodate 250 beds, that would afford nearly 800 square feet per bed, which is much less than the space thought necessary in the newest Continental hospitals—e.g., at Antwerp, Berlin, and Dresden; but it must be observed that the space is supplemented, for the present at least, by the adjoining open ground occupied by the Medical School and University.

Mr. John Marshall, F.R.S., proposed in 1878 to construct hospital wards in the circular form, and this form has been adopted in the new hospital at Antwerp for 380 beds. The wards of this hospital depend upon the windows for ventilation, except in winter, when certain arrangements for the inflow of warm, and the removal of foul, air are provided. In cases of hospital construction practical experience is of more value than theoretical arguments. The Antwerp Hospital is not yet completed. When it shall have been in operation for a sufficient time, the experience derived from it will be watched with great interest. The whole efforts of the most advanced of the recent constructors of hospitals in Europe, and the constructors of the John Hopkins Hospital in America, have been directed to the separation of the several wards units which make up the hospital, and this separation is adverse to economical arrangements for mechanical ventilation. The circular form of ward appears to have had partly for its object to round the angles of the wards so as to prevent them from being places for the stagnation of the organic matter in the air. This object has been sought to be attained in another way by M. Tallet, in France. He adopts what he terms an "ogival" shape for the vertical cross section of the ward. This method of construction is very simple, free from angles, and fireproof, as the roof is free from wood; and the air space between the tiles on the roof keeps up an equable temperature in the wards. Sir John Pringle recorded many similar experiences.

The experience of the Crimean war led to the universal adoption of the pavilion system in this country. The Franco-German war in 1879 furnishes us with numerous examples of the curative effect of fresh air, and in many of the temporary hut hospitals which were organised by the Germans in the several towns adjacent to the frontier, to which the wounded from the field hospitals were removed, the sides were furnished with large flaps hung on hinges, so that they could be lifted up and left open in the daytime to admit of full circulation of air; and even when these were closed at night the ventilation was very plentiful. These experiences of war hospitals appear to have led the Germans to introduce single-storey pavilions for surgical cases in their new hospitals; and the French, who seem to be quite as much advanced in hospital construction, have adopted single-storey pavilions for the whole of their sick wards in their most approved new hospitals.

The question of the effect of the aggregation of the sick under one roof, or in one hospital, has also received much consideration in this country and in America during the last twenty years. The subject was brought into prominence in America during the American civil war; and in this country Sir James Simpson took up the question as an ardent advocate for diminishing the size of hospitals. The management and nursing have often more to do with the success of a case than the form of the ward; and whilst it may be true that a fair general idea of what are the difficulties of large hospitals may be obtained from results of the large number of cases, it is equally clear that we may produce bad results by neglect in a good cottage hospital, whilst, possibly, with eminent care, we may produce good results in a badly-constructed town hospital. As regards the facility of inspection, it is quite certain that a view of the beds in a distant cubicle could not be obtained through a series of glass partitions, and, admitting the desirability of isolating the patients, the complications of Mr. Greenway's method seem to present difficulties and to create corners for dirt.

The conclusion to which these various considerations would lead us is that for fever and small-pox hospitals temporary structures, to be renewed at frequent intervals, are desirable for the reception of the sick, the only permanent buildings being those for administrative purposes and for the use of the hospital attendants. It would also be desirable that every part of the ground attached to such hospitals should be paved or asphalted, except where covered with vegetation. It is questionable whether it would not be preferable for some, at least, of the surgical wards to be temporary structures so far as the walls and roof are concerned. But permanent structures would be necessary in all cases where uniformity of temperature must be maintained; and it seems probable that some modification of the Tallet system may be found to be the most convenient form of ward for the immediate future. Whatever may be the discoveries of science in respect to the origin and propagation of disease, the experience of the whole civilised world in the matter of hospital construction appears to point with unerring certainty to the fact that just as pure air is the best safeguard against disease, so does a free atmosphere produce the conditions most favourable to the cure of disease and to the healing of injuries. With simplicity in the form of hospital building we shall do well to combine shortness of duration, for if the aggregation of sick is in any degree injurious the hospital building must partake of that injury in an enhanced degree. The longer I study this question of hospital construction the more

firmly do I become convinced that hospitals should not be built for a long futurity.

Mr. H. Greenway, of Plymouth, has objected to Captain Galton's criticism of his system. He says: Captain Galton, when alluding to my plan, was in error in asserting "that a view of the beds in a distant cubicle could not be obtained through a series of glass partitions." If the partitions were made entirely of common glass, no doubt distant objects would appear distorted; but, in order to obviate this drawback, a portion of each partition (about 5 feet square) in the line of sight from the nurse's room would be stout plate-glass, and my experiments have proved such glass prevents obscurity and distortion. Captain Galton, whilst admitting the desirability of isolating certain patients, says "the complications of Mr. Greenway's method seem to present difficulties and to create corners for dirt." There are no complications in my mode of isolating beyond the multiplication of corridor doors, in order to give the power of converting into temporary ante-rooms any portions of a corridor outside the patients' rooms. These doors, however, I have stated are not essential to my plan, and they would be very seldom used. As regards the "corners for dirt," there would be no more in each compartment than in an ordinary ward; and, supposing there was such gross mismanagement as to allow dirt to remain about, it would not be absorbed either by the glass partitions or by the metal-covered floor.

Captain Galton, when explaining the model of a transverse section of my hospital, said: "A compartment is ventilated by opening its door and the window on the opposite side of the corridor, and then closing the corridor doors; also by a tube which opens through the floor underneath the bed." It was only on the 29th of last month I received a letter from him objecting to artificial ventilation for hospitals, and advocating natural ventilation by the windows. I replied that the tubular ventilation in my plan was natural, although it could be accelerated by artificial means, and that I could give window ventilation in the manner above described, "but this would never be required." I was therefore surprised to hear Captain Galton speak of this window ventilation across a subdivided corridor as my mode of supplying air, when I said (respecting ventilation by the two-inlet tubes), "I believe I have provided more than a sufficient amount of air, and under certain circumstances it would have to be lessened."

If Captain Galton, in addition to his knowledge of military engineering, had the experience of a medical practitioner, he would be careful not to expose a patient suffering from scarlet fever, measles, and certain other diseases to excessive ventilation, especially in such a climate as ours. The late Dr. A. P. Stewart, who presided over the Public Medicine Section in 1871, told me, after I had read my paper on hospital construction, that he had known many a patient die from lung or kidney affection produced by being exposed to excess of ventilation; and such would be the general verdict of the profession. All we require is that the patient shall be surrounded with pure air.

### THE VICTORIA HALL ACCIDENT.

THE report of Mr. Hugh Shield, Q.C., M.P., who attended on behalf of the Home Secretary the inquiries into the death of the one hundred and eighty-three children by the crush at the Victoria Hall, Sunderland, on June 16 last, has been presented to Parliament. Mr. Shield offers the following observations on the evidence: With regard to the question, How came the swing-door to be closed and bolted? I am unable to state with confidence any conclusion other than that which was expressed in the verdict of the jury—viz. that the evidence was not sufficient to determine it. Without intending to judge severely the evidence of the children, I think it would be unsafe to rely on the accuracy of their statements as to seeing Hesselstine put down the bolt. On the other hand, there are some proved facts and some probable inferences which appear to favour Hesselstine's story. The swing-door was, when Graham last saw it—less than an hour before the calamity—in a position from which it could easily be moved. If moved so far as the socket it was in the highest degree probable that the bolt would fall into the socket. There is another theory inconsistent with Hesselstine's story, and not exactly in accordance with the children's evidence, which has a considerable degree of probability to recommend it, viz., that Hesselstine, wishing to regulate the outflow of children in order the more easily to distribute the prizes, drew the door from the wall, and the bolt of its own accord fell into the socket. I concur in the recommendations of the jury that the swing-door should be removed. It was not in the hall as originally built, but was added in 1876, without consultation with the architect, Mr. George G. Hoskyns, who stated in evidence that he would not have sanctioned it. The objects for which the door was erected were: To shut off the gallery on occasions when it was not intended to be used, to obviate undue crushing on the stairs on entering, and to prevent draught. I conceive that these objects might be secured by other means, and that it is undesirable to retain a door which from its liability to escape observation could not be otherwise than a source of danger. I think no door which is so situated

as to be capable, whether through accident or mismanagement, of impeding the egress of a large number of people from a building, ought to be furnished with a bolt such as that which rendered the swing-door immovable on the occasion of this disaster. It was made of smith-forged iron, the strongest description of ironwork. The object for which a bolt upon a principal door of egress can be required might be attained by the employment of a bolt of a lighter description, which would yield to pressure in the event of a block. Mr. Hoskyns stated that all the bolts designed by him for the doors of the Victoria Hall were of this light description, although, it is to be observed, other doors besides the swing-door are at present furnished with heavy iron bolts. A suggestion well worthy of consideration was made by another architect, Mr. Frank Caws, that all such bolts ought to be spring bolts which would remain up except when kept down in the sockets. Although I am of opinion that no individual in connection with this disaster was guilty of such negligence as would support a criminal charge, I consider Mr. Fay and Mr. Coates censurable in a high degree for their recklessness in allowing so large a number of children to be brought together in the hall at very short notice to the hall-keeper, without having provided an adequate staff of assistants to control and protect the children, and without having taken pains to impress even the few assistants they had with any clear sense of responsibility. Of all the persons connected with the entertainment and the hall who were present on June 16, I feel bound to say that, judging from what they did and what they omitted to do before the disaster occurred, they appear to have thought of nothing in relation to the audience but the collection of the money. It is unnecessary for me to remark on the action of the schoolmasters and teachers, which was censured by the Vice-President of the Council in the House of Commons, in answer to a question addressed to him by Mr. W. James, M.P.

### LEGAL.

High Court of Justice.—Aug. 4.

(Before Mr. Justice WATKIN WILLIAMS.)

YOUNG & Co. v. BACON.

THE HOLBORN STATUE.

This was an action brought to recover the balance of account alleged by the plaintiffs, of the Eccleston Iron Works, Pimlico, to be due to them from the defendant, Mr. Charles Bacon, the sculptor. During and between the years 1871 and 1877 the plaintiffs executed certain works for the defendant, among others those in connection with the equestrian bronze statue of the late Prince Consort on Holborn Viaduct, and with the Candlish memorial at Sunderland. The substantial questions in the case were as to the terms upon which the plaintiffs had contracted to do the work for the defendant, and as to whether or not the charges made by them for extras were fair and reasonable. The amount paid to them by the defendant between 1871 and 1877 was 1,181*l.*, and they claimed a further 115*l.* from him. The defence was that not only was nothing due to them, but that, as a matter of fact, they had been overpaid to the extent of 200*l.*, repayment of which sum the defendant claimed by his counter-claim. By an error two sets of figures had been transposed in the particulars given by the plaintiffs, the mistake having originated in the entries in their ledger. The error consisted in the price, 500*l.*, of the work done by the plaintiffs on the figures at the base of the equestrian statue of the Prince Consort having been entered as the cost of the figure itself, which was, according to the contract, to be only 300*l.* Signor Raggi, the sculptor, was called by the plaintiffs to prove that the charges made by them for the extras were fair and reasonable. Mr. Bacon was the only witness called in support of his own case.

The jury found for the plaintiffs both on the claim and counter-claim after deliberating for only a few minutes in the box.

His Lordship gave judgment accordingly for the plaintiffs for 115*l.*, expressing his concurrence in the verdict.

### NEW BUILDINGS.

**The Gilstrap Free Library, Newark-upon-Trent.**—These buildings, which have been designed by, and erected under, the superintendence of Mr. Henman, A.R.I.B.A., of 38 Bennet's Hill, Birmingham, for Mr. William Gilstrap, of Farnham Park, Bury St. Edmunds, were formally opened on the 26th ult., and by him presented to his native town, the mayor and corporation attending in state, accompanied by a large number of the inhabitants. Mrs. Gilstrap performed the ceremony and presented to the mayor, for preservation among the muniments of the town, a very handsome key in silver parcel gilt, specially designed for the occasion by the architect. The head of the key bears on one side the arms of Newark, and on the reverse those of Gilstrap; the stem is octagonal, surrounded by a scroll, on which is engraved "Free Library, Newark-upon-Trent, built and endowed by William Gilstrap, Esq., opened July 26, 1883." After the building had been declared open for the free use of the public, and the deeds handed over to the chief magistrate, an address and the thanks of the

working men of the town were presented to Mr. Gilstrap. Then the company marched in procession to the town hall, where luncheon was provided by the mayor, and the donor received the thanks of all classes for his munificent gift. The buildings consist of the borrowers' hall, a general, a reference, and a ladies' reading-room, the library, and a librarian's private office, and are very generally admired for their completeness of arrangement and artistic treatment. The total cost to Mr. Gilstrap will amount to about 8,000*l*.

### CHURCH BUILDING AND RESTORATION.

**Allerston.**—The parish church of Allerston, near Pickering, has been reopened after having undergone restoration, which has been completed at a cost of about 1,000*l*. The work of restoration has been carried out under the direction of Mr. Ewan Christian.

**Blackburn.**—St. Stephen's Church, Tockholes, has been reopened. The roof and walls having fallen into a state of partial decay, and other portions of the building requiring repair, Mr. Bertwistle, architect, of Blackburn, made an examination of the church, and, acting on his report, it was determined about a year ago to rearrange the interior of the church, repair the outer walls and roof, substitute a new floor for the old wooden one (in which the presence of extensive dry rot had been detected), and to replace the old high-backed and very uncomfortable pews with more modern seats. These works have now been carried out, under the direction of Mr. Bertwistle, by Mr. Thomas Fawcett, contractor, of Blackburn. The church in its altered arrangement will seat 620 persons. It consists of a nave and north and south aisles. There are also three cross aisles, one at the extreme west of the building, a second leading from the principal entrance, and a third divides the body of the church from the new quasi chancel.

**Dearham.**—The parish church of Dearham has been reopened after restoration and enlargement. Mr. J. C. Ferguson, of Carlisle, is the architect. The following are the contractors for the works: Masonry, the late Mr. W. Marshall, of Maryport; joinery, Mr. W. Foster, Wigton; slating, Mr. T. Mandle, Maryport; glazing, Mr. Palmer (late Scott), Caldewgate, Carlisle; plastering, Mr. Ormerod, Carlisle. The total estimated cost of the work is 1,750*l*.

**Dovercourt.**—The foundation-stone of a new church has been laid. The first portion of the church will cost 1,600*l*. When fully completed the cost will amount to 3,500*l*. The church will consist of chancel, nave, aisles, and west tower and spire. The edifice throughout will be of red brick, except in the pillars and some of the windows. Mr. J. Edward Cutts, A.R.I.B.A., is the architect, and Mr. George Dobson, the builder.

**Ilkeston.**—The foundation-stone of a new church, dedicated to the Holy Trinity, has been laid. It will consist of a nave, 68 feet by 21 feet; north and south aisles, each 68 feet by 10 feet 6 inches; chancel, 34 feet by 21 feet; chancel aisle, 34 feet by 10 feet 6 inches; with vestry and organ chamber. The main entrances will be through a western doorway and a south porch. The height of the nave from floor to ridge of roof is nearly 50 feet. The church will provide, when complete, 512 sittings. The first section to be built is the nave, which will accommodate about 250. The style is Early English; the walls will be built of stone, and the roofs covered with red Staffordshire tiles. The architects are Messrs. Evans & Jolley, of Nottingham.

**Mull.**—A new free church has been opened at Salen, Mull. The building, the foundation-stone of which was laid about a twelvemonth since, has been erected from the plans and designs of Mr. Hay, architect, Edinburgh.

**Reddish Green.**—The new church of St. Elizabeth, which has been erected by Mr. W. H. Houldsworth, was opened on Saturday last. The building has been erected from the designs of Mr. Alfred Waterhouse, A.R.A.

**Teignmouth.**—A Congregational church, recently erected at Teignmouth, has been opened. The building is in shape somewhat cruciform. The north end has a traceried four-light window, which surmounts an open segmental arch leading to the two vestries. These are built partly inside and partly outside the body of the structure, and an apsidal chancel is thus secured which is utilised for the organ and choir-stalls. There are five bays, in two of which, on the street side, are twin windows, and in the transept-gables are high double windows with a wheel light over them. The south end of the church is semi-octagonal, with large clerestory windows, and contains a deep gallery. Mr. J. Sulman, of Furnival's Inn, E.C., is the architect, and the contractors were Messrs. E.C. Howell & Son, Bristol.

**Mr. Justice Watkin Williams** on Saturday testified to the successful arrangement of the New Law Courts in the Strand. "It is only fair to mention," he said, "that my experience of the management of the courts is that it is as perfect as possible; the ventilation has been so complete that the temperature of the courts has left nothing to be desired, and there has been a great improvement in their acoustic properties. I have, indeed, seen nothing like them anywhere else in England."

### GENERAL.

**Mr. Reid, R.S.A.**, has received a commission to paint a portrait of the Duke of Richmond and Gordon, for the gallery at Gordon Castle.

**The Ninth Annual Exhibition** of the Sheffield Society of Artists closed on Saturday last.

**Mr. Millais, R.A.**, has nearly completed his portrait of Mr. Henry Irving, which he will present to the Garrick Club.

**Mr. Alma Tadema** is to supply the frontispiece to *The English Magazine*, published by Messrs. Macmillan & Co., the first number of which is to appear in October, under the editorship of Mr. J. Comyns Carr.

**The Dalbeattie Fine Art and Loan Exhibition**, which has proved a great success, was closed on Saturday last after being open four weeks. A surplus of over 100*l*. will be devoted to the library of the Mechanics' Institute.

**The Chancel of St. John's Church, Weymouth**, has been embellished with the addition of a richly-carved reredos—in Caen stone and white alabaster—a new organ case, and elaborate mural and roof decoration, from the designs and under the superintendence of Mr. E. Francis Clarke, architect, of 7 Westminster Chambers, S.W.

**A New Clock**, the gift of the colonel and officers of the 1st Battalion of the Wiltshire Regiment, has just been fixed in the tower of Salisbury Cathedral. It has been presented as a memorial of the officers, non-commissioned officers, and men who died in India during the year 1868 and the present year.

**An Oak Pulpit** has been placed in the church of St. James, Wednesbury. It was designed by Messrs. Horton & Scott, of Birmingham, and constructed by Messrs. Jones & Willis.

**The Duke of Westminster** has given 1,000*l*. and a site of six acres of land towards the erection of a church at Caerfallwch, Northop, near Chester.

**The Salford Borough Council** have voted an honorarium of 100*l*. to the borough engineer, for extra services in connection with the preparation of plans for the Parliamentary committee.

**The Benchers of the Temple** have decided to have Nos. 3 and 4 Garden Court taken down and rebuilt. The tenants occupying the chambers have received notice to quit, and the work of demolition, it is intended, will begin about the end of the year.

**The Church of St. Michael-at-Coslany** is to be restored under the direction of Messrs. Oldham Chambers & Willins, architects, of Norwich. Amongst the works contemplated is the continuation of the beautiful flint tracery of the Thorp Chapel round the exterior of the chancel, together with the reinstatement of the original east window.

**The Northwich Town Hall** has for some time shown evidence of falling on account of the subsidences in this district. The front portion inclines towards the street about twenty inches out of the perpendicular, and the local board have condemned the building as positively unsafe, applying to the magistrates for an order to compel the owners to either pull it down or secure it. The bench made the order asked for.

**Mr. J. Hamilton**, the demonstrator in engineering at Mason's Science College, Birmingham, has been awarded the highest Whitworth Scholarship for this year, value 200*l*.

**A Contract** for paving the principal streets of Dumfries with granite has been obtained by Mr. Dobbie, of Leith.

**The Aberdeen Town Council** have adopted the report of the Committee promoting the City Improvement Extension Bill, which, *inter alia*, stated that the expenses connected with carrying through the measure amounted to 4,231*l*. Of that sum 500*l*. is to be paid to the Committee of Citizens who opposed the Bill in terms of the compromise agreed to.

**The Operative Plasterers** of Edinburgh are at present moving with a view to secure uniformity in the rate of wages paid by the employers throughout the city.

**The new Streets** made in the recent improvements at Hyde Park Corner are on land that was part of the Green Park, and consequently part of the parish of St. Martin-in-the-Fields. But being in effect extensions of Piccadilly and Grosvenor Place, they practically form part of streets situate in the parish of St. George, Hanover Square. In a Bill introduced by Mr. Shaw Lefevre it is provided that the Metropolitan Board of Works may direct that the new streets shall be wholly or partially under the management of the Board or the Vestry of St. Martin's or that of St. George's. The Board is also to direct in what manner the costs of the maintenance of the streets is to be defrayed, whether by contributions from all or any of these bodies or wholly by one of them.

**Ventilation of Public Buildings.**—Messrs. Robert Boyle & Son, 64 Holborn Viaduct, and Glasgow, have recently had their system of ventilation adopted for the following public buildings: New Art Galleries, Liverpool; New Art Gallery, Birmingham; Guildhall, Bristol; New Public Hall, Cardiff; General Post Office, Manchester; New Theatre and Concert Hall, Devonshire Park, Eastbourne; Boys' Home, Forest Hill; Children's Hospital, Brighton; new Workhouses, Wandsworth. They are also at present ventilating for Mr. Arthur W. Blomfield, F.R.I.B.A., St. Michael's Church, Paddington; St. John's Church, St. Leonards; and Emmanuel College Chapel, Cambridge.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, AUGUST 11, 1883.

### TENDERS, ETC.

Mitchell, plasterer	28	0	0

Total £1,046 01 0

## SPRAGUE &amp; CO.

Lithographers, Engravers, and Printers,  
22 Martin's Lane, Cannon St., London, E.C.

BILLS OF QUANTITIES, SPECIFICATIONS, REPORTS  
Copied or Lithographed with rapidity and care.

SPRAGUE'S "INK-PHOTO" PROCESS FOR REPRODUCING  
COLORED DRAWINGS OR PHOTOGRAPHS.

PLANS of ESTATES, with or without Views, taste-  
fully lithographed and printed in colours.

## PHOTO-LITHOGRAPHY.

CERTIFICATE BOOKS for Instalments, 3s., or with  
receipt, 5s. Bill Paper, 17s. 6d. & 25s. per ream.

SPRAGUE'S TABLES, upon application.

## SILICATED CARBON MAIN-SUPPLY FILTER.

FOR FILTERING THE WHOLE OF THE  
WATER-SUPPLY OF A BUILDING BEFORE USE.  
Complete ready for fixing, from £8 0s. each.

SILICATED CARBON FILTER CO.  
BATTERSEA, LONDON, S.W.

CHEAP DAYLIGHT REFLECTORS.  
Before ordering elsewhere send particulars for estimate  
from the Galvano-Mercurial Silvering Co., 123 Well Street,  
Blackney, E. NOTE.—The superior reflecting power generated  
by Daylight and other reflectors silvered by our process is  
acknowledged by the highest scientific authorities to be the most  
powerful extant. 90 per cent. more light is obtained and perfect  
action guaranteed for fifteen years in any climate.

BY HER ROYAL  
MAJESTY'S LETTERS PATENT.  
ESTABLISHED A.D. 1771.

## AUSTIN'S SUPERFINE FLAX LINE.

The above article is now being manufactured and sold in large  
quantities for Greenhouse Sashes, Public-house Shutters, and  
other heavy work. The Manufacturers would recommend it for  
its strength, and the large amount of wear in it, consequent on its  
peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND  
BLIND LINES (two Prize Medals awarded). The manufacturers  
of the above articles particularly wish to draw the attention of  
the trade to their Imperial Patent Flax Sash Lines, of which  
they are now making five qualities; and they strongly recommend  
that in all cases they should be purchased in preference to the  
patent lines made from jute, which article has neither the strength  
nor the durability of flax, consequently cannot give so much  
satisfaction to the consumer.

They also invite the particular attention of the trade to their  
IMPERIAL PATENT BLIND LINES, which are very superior  
to anything yet offered.

They can be obtained of all Rope-makers, Ironmongers, Mer-  
chants, Factors, and Wholesale Houses in town or country.  
N.B.—Please note that all our goods as advertised above are  
labelled either inside or outside with our Trade Mark—The  
"ARROW."

## TIPTON.

For Proposed Alterations at Great Bridge Schools, for the  
Tipton School Board.

Tranter, Tipton	£1,653	0	0
Nelson & Son, Dudley	1,569	0	0
Bate, Dudley	1,251	10	0
GUEST, Brettell Lane, near Stourbridge (accepted)	1,220	0	0

## WEST HARTLEPOOL.

For Building House and Shop at Wingate, for Mr. Tho-  
mas Lee. Mr. ROBERT DUNIPAGE, Architect, West  
Hartlepool.

Accepted Tenders.			
Pybus, West Hartlepool, bricklayer, &c.	£246	0	0
Beetham, Bishop Auckland, joiner, &c.	148	0	0
Hunter Bros., West Hartlepool, plumber	29	0	0
Bell & Hammond, West Hartlepool, plasterer	50	0	0
Howe, West Hartlepool, slater	30	12	6
Stokell, West Hartlepool, painter	9	0	0

Total £512 12 6

## BEST BATH STONE.

WESTWOOD GROUND, BOX GROUND, COMBE DOWN  
CORSHAM DOWN, AND FARLEIGH DOWN.

RANDELL, SAUNDERS, & CO., L<sup>D</sup>.  
CORSHAM, WILTS.

## STONE BROTHERS,

BATH STONE MERCHANTS,

Supply direct from their own Quarries,  
CORSHAM DOWN, FARLEIGH DOWN,  
BOX GROUND, COMBE DOWN,  
STOKE GROUND, AND CORNGRIT.

For Delivered Prices & Water Freight, apply to  
BATH STONE OFFICE, BATH.

YOCKNEY & CO., Quarry Owners.

Prices quoted on application for Delivery at any Port or  
Railway Station, for all varieties of  
BATH STONE, { Selected specially to suit Architects'  
Specifications and Builders' use.  
Address—YOCKNEY & CO., Corsham Down Quarry, Wilts.

# The Architect.

## OPEN-AIR SPACE IN SUBURBAN BUILDING.

RECENT Act of Parliament, procured by the Metropolitan Board of Works, entitled the "Metropolis Management and Building Acts Amendment Act, 1882 (45 Victoria, ch. 14), provides that, in building upon hitherto unoccupied ground, there shall be left "open spaces to dwellings," that is to say, back-gardens or yards, of such extent as to measure

superficially, as a minimum, from 150 square feet for the smallest houses to 450 for the largest; these "open spaces," however, may be covered with buildings of the height of one storey above ground. This is to be taken, therefore, as the latest movement in favour of the principle which has so long and so urgently been advocated, that the open-air ventilation of the town should be properly provided for. The reader may perhaps think the Legislature have not even yet gone far enough; and this is the question we ask leave to consider.

To come at once to the practical point, let us take the case of any new district of average class, in the suburbs of London, at present being built over. It is not necessary to have a particular locality in our eye; there are cases of the kind all around the metropolis; indeed there are not very many exceptions to be met with. To begin with, the road is 40 feet wide, and about 6 feet along each side is added for the sake of "gentility" as a forecourt within a railing. The depth of the house itself we may put at 35 feet. The statutory depth of the "open space" in the rear may be put at 15 feet, and this is what is allowed to be partially, or wholly, built upon to the height of one storey above ground.

Now let it be borne in mind that the "laying out" of the "estate" has been done preliminarily by a skilled person. Perhaps this skilled person is the speculation builder, who takes the land by the lump and "makes the most of it" for himself. Perhaps, on the other hand, the plan has been furnished to him beforehand, and prepared by the ground landlord's surveyor under instructions "to make the most of it" for his employer's ground-rents. Perhaps the ground landlord has had a hand in it, to look after himself; perhaps his solicitor is a gentleman of shrewdness and experience in such matters in the capacity of money-provider, and has given to the cause of "making the most of it" the benefit of his own skill. At all events, in any case "making the most of it" has been the great greedy guiding purpose, and if the reader happens to understand the subject he will admit that the dimensions we have given in the typical case above suggested must be taken to represent somewhat liberal dealing. No doubt the depth of 15 feet which we have taken for the back garden may be 30 or 40 feet, or more, when the laying out is very liberal; but there are so many instances in which the land is strictly economised, that we will take leave to regard economy as the rule; and, indeed, we have seen the very smallest spaces turned into such very nice little garden plots, or playgrounds, or smoking promenades, as the case may be, that we feel it would be idle to ignore the fact that the expert laying out of a suburban building estate involves, much more frequently than otherwise, the acceptance of the statutory minimum as an authoritative rule of guidance. We may, therefore, proceed to consider what comes of it.

The proportion thus produced between covered and uncovered ground is this: 35 feet in depth, covered four or five storeys high, including basement and roof attics; uncovered, 20 feet (half the street), *plus* 6 feet (forecourt), *plus* 15 feet (garden or yard), in all 40 feet. Leaving minutiae out of account, we may therefore say that in a vast number of most respectable cases the builder is considered to be doing the right thing when he covers nearly half of every acre of land with houses between 30 and 40 feet high above ground, and perhaps 6 or 8 feet deep underground; and this is quite enough for our present purpose. We simply ask the question whether this ought to be allowed.

The practical circumference of London, over the whole of

which such building operations are at this moment being carried out, may perhaps be put at thirty or forty, possibly fifty miles; and what the Legislature allows to be done is that one ring after another, year after year, like the rings of wood in a tree, shall be very nearly half-covered with lofty houses, leaving no open breathing-spaces at all that ought to be so called, but distributed in perfect regularity, with the remaining half chiefly devoted to the primary purpose of burrows or comparatively narrow traffic-ways between the rows of houses, for the people to pass to and fro, and otherwise to the secondary purpose of little enclosures behind, which sometimes are scarcely sufficient to let light in at the windows. As for real "open spaces," they have to be purchased out of sheer charity by the public authorities from the greedy persons who in this way "make the most" of their land, and whose tenants, be it remarked, would theoretically smother but for this occasional purchase of a few acres as a "lung," at what is simply a stupendous price, to form a park withal; the price which we here take the liberty of calling stupendous being, of course, the very fullest estimated value to which the land can be run up by being in imagination built over upon this purely reckless commercial principle.

Now we cannot hesitate a moment to say that, with such a circumference as London possesses, it is madness to allow the lust of ground-rents to encircle the town with so dense a belt of building as we have described. It is well known that every owner of a few acres of grass land, as his property comes in its turn within the building limit, at once magnifies his fortune twenty or thirty fold. What the true philosophy of political economy would say to his natural title to the whole and sole benefit of this windfall we will not inquire, but it is quite clear that English law has already recognised the right of the public to have a voice in the disposal of the land for actual building operations. Not only must the owner surrender so much of his land as shall form streets of convenient width, but he must surrender so much more of it for the purpose of giving sufficient light and air in the rear. The well-known law whereby the height of a house is limited to the same dimension as the width of the street, is a further instance of the established right of the authorities to determine how much of one's land shall be covered with houses for the owner's adventitious profit, and how much of it shall be left uncovered for the sake of salubrity. Perhaps it is impossible for exact science to demonstrate the precise proportion of one's private land which, in the public interest, ought thus to be allowed to be built over; but for our own part we submit with confidence that to cover half of every acre, or so nearly half as we have been speaking of, is to cover too much. A jury, for instance, of competent men, might be expected anywhere to say so promptly. The very fact of "parks" being in request is proof positive. The annual flight of Londoners at this season to the country for a few weeks' recruiting of their health is proof positive further; for when they speak of requiring "change of air," what they really mean is better expressed by the alternative phrase "a breath 'of fresh air," the air of a town so closely built over being not "fresh"—that is to say, not fresh enough to live by.

What, then, do we actually propose? We need not be at all mealy-mouthed about it. We hold that in the mere interest of the death-rate, or life-rate, of every large town, the density of building ought manifestly—too manifestly to require argument—to be decreased as the diameter increases. We will, indeed, take this to be mathematically self-evident, as the only practical form in which the more simply scientific proposition can be put, that the greater the size of the town the less ought the house-density to be throughout the whole area of the town. We cannot, of course, reduce this density in the old quarters, but we must all the more, therefore, reduce it in the new. Consequently, it seems impossible to deny that the public authorities ought to be endowed with larger powers of restraint than they now possess. As a tentative proposal, why should not every owner of new building-land be compelled to leave at least three-fourths of his land uncovered, including the appropriation here and there of large spaces for such squares and parks as experience proves to be necessary? The owner himself, we shall say, would object; but many owners would, if they could, even curtail the proportion of sacrifice which is already insisted upon. In one view of the matter the restraint, however regulated, is confiscation, no doubt. But, as we have observed, the principle of restraint is already fully accepted; indeed, it is so all over the civilised world. The only question is, What is the proper limit of its application if

the people of a town are to live and not die? One observation further which we may make is this: that when a piece of land now worth 100*l.* an acre as a grass-field is to become worth 2,000*l.* or 3,000*l.* an acre within a few years as building-ground to be only half covered, the owner may very well be satisfied to sacrifice a much larger proportion of so disproportionate an increase than might at first sight seem reasonable.

### ROMAN CONSTRUCTION.\*

WHEN the architecture of Rome is mentioned, it suggests a vision like those which arose before the eyes of PIRANESI, COCKERELL, and ALLOM, when they produced their restorations of the Eternal City. So little is left of that Rome which was the mistress of the world, it is necessary for us to seek the aid of imagination if we would realise what she was in the days of her greatness. But imagination is supposed to be out of place in connection with the scientific archaeology of modern times, and few men have less employed it than Mr. PARKER. He has toiled with the greatest patience in excavating the ground at Rome, but it has not been with the hope that inspired so many among the old school of archaeologists. They sought for statues, vases, bronzes, inscriptions, carved capitals, and other works of art—things that brought gold as well as fame, and excited the envy of rival explorers. Mr. PARKER has been more disinterested. He sought for the remains of the massive walls and fortifications, for the foundations of the palaces, prisons, conduits, or, in other words, for examples of Roman work which were not removable. His investigations have thus a relation to the ordinary labour of the archaeologist that corresponds to the relation between engineering and architecture. A civil engineer might be supposed to undertake the examination of the substructures of Rome (that is, if we can assume one of the profession to abandon his profitable work for a sufficient period), but it is somewhat remarkable to find an amateur, whose knowledge of masonry has been derived from a study of the Gothic churches in England and Normandy, devoting several years of his life for the purpose of gaining accurate knowledge of a kind of work which has been hitherto almost despised. Mr. PARKER has from time to time described what he has done and persuaded others to do in Rome; he has also had photographs taken on a large scale, and plans and sections prepared to enable scholars to understand the character of the construction. But the volumes and illustrations are hardly available for students, and to meet their wants an abridgment has been compiled by Mr. SHADWELL. It forms an excellent little book, which can be read with advantage in schools and colleges, and will be useful in supplementing the ordinary guides to Rome.

The first seven chapters explain the means adopted to fortify Rome from the time when the inhabitants of the Seven Hills were as much opposed to one another as were Highland clans at a later age. The several fortifications were afterwards connected by SERVIUS TULLIUS, and thus formed a sort of continuous protection. From time to time additional works were constructed by other rulers, and if the "Itinerary of Einsiedeln" is accepted as evidence, the fortifications comprised in the ninth century 383 towers, 7,020 battlements, 6 posterns, 106 corbels, and 2,066 large openings. What some of those words meant is not clear. In PLINY's time, it is said, there were eighteen gates. According to another authority the number was fourteen. At present there are twelve in use, and in addition there are five near the Vatican of mediæval and post-mediæval construction.

The existence of so many hill fortresses was an impediment to the laying out of straight and wide means of communication. The most despotic of the emperors was never able to Haussmanise Rome, and it is not unreasonable to conclude that the pictures by modern artists, which represent ancient Roman streets as steep and narrow, are at least as true as most descriptions of historical events. When the banks were no longer required for fortifications they were utilised for sites, houses being built into them or above them or in the fosses, without any consideration for lines of frontage or gradients. We are informed that "it is found usually that the streets within the city occupying the old foss-ways lay about twenty feet below

the ordinary surface of the ground. In some places two pavements have been found at different levels." It is needless to say that outside the gates the roads were of a different kind; economy was often sacrificed to secure a straight line between two towns, a principle that was followed by the late Sir JOHN RENNIE in planning railways.

The Roman aqueducts, which are next described, were wonderful works, although ignorance of hydraulics is often shown in their construction. At a time when a sufficient water-supply for London appears to be unattainable it should be known that the nine aqueducts conveyed to Rome a quantity that was equal to a stream 20 feet wide by 6 feet deep, flowing at an inclination six times as rapid as that of the Thames. A better notion of the Roman water-supply may be formed when it is said that the aqueducts carried 333,000,000 gallons every day into the city.

But the making of roads, aqueducts, and fortifications can hardly be considered architect's work, and Mr. SHADWELL's book might, with accuracy, be called the Engineering History of Rome. Some types of buildings are, however, described. First are the baths, which of course are related to the work for water-supply. The description of the remains of the *Thermæ of CARACALLA* will indicate the grandeur that was combined with sanitation in Rome:—

The walls are sufficiently perfect to allow the outline to be made out; they exhibit the plan of a square of 1,100 feet on each side. The front of the central building is 720 feet long, the width across 375 feet, and from this, in the centre of the western side, the calidarium, or hot-air chamber, circular in form, projects 150 feet. The walls of this last are all hollow, with hot-air flues, heated by the hypocaust in the underground chamber. The piers of the calidarium are about 180 feet high. The various chambers are divided into compartments of shallow basins, with shelving sides, from 2 to 3 feet deep, while the frigidarium has vertical sides, and is 4½ feet deep, admitting a header plunge. The whole of the bath chambers are paved with mosaic, replaced where faulty by marble fragments inlaid with cement. The material for the walls throughout is of brick 1½ to 1¾ inch thick. But the fallen capitals attest the great magnificence of the ornamental portions, and a prostrate granite column measures the extraordinary diameter of 5 feet 8 inches. Nothing of the marble porticoes surrounding the whole building remains. But the apparatus for bathing occupied only a portion of the enclosed space; provision was made for athletic exercises and games, which required an arena, and part of the ground was planted so as to afford shady walks. Against the western external wall are the remains of the great reservoir of water, and of the aqueduct, the latter covered with tiers of seats, and immediately below them is a space which is considered to have been a stadium.

Chapters are also given on the Forum Romanum, the Mausolea, the Colosseum, the Palaces of the *CESARS*, and the information represents the latest researches.

However interesting Roman work may be owing to its associations, classicists must admit that there is little of it which suggests that beauty was sought after. The construction which is shown in Mr. PARKER's photographs is more allied to what is found in modern railways, harbours, and sewers than to the masonry of Greece or Mediæval Europe. It may be said that, with the exception of the Pantheon, the stability of the work is as much owing to the quantity of material that was employed as to its scientific distribution. The walls are of colossal dimensions, but they could have been made equally strong with much less material if the exterior had been "battered" like modern retaining walls. The great wall of *AURELIAN* was, notwithstanding its dimensions, unable to resist the blow of a battering ram. The voussoirs of the arches are of unnecessary depth, and generally they are uniform in size from the crown to the springing. All things considered, the best work of the Romans is to be seen in their concrete walls. The material was carefully compounded, and in this kind of construction there are not so many examples by the builders of other nations to allow of a comparison. Some of the Roman concrete walls will only succumb to gunpowder and dynamite. The Italian Government attempted the destruction of a wall of concrete on the Quirinal, but the operation was found to be so expensive it had to be abandoned.

In the use of what is known of late days as veneering, the Romans were adepts. It is often difficult to guess the material which forms the principal constituent in a Roman wall, and in some of the systems the nature of the exterior is a puzzle. Thus, for example, Mr. PARKER says that:—

The *opus reticulatum* is often supposed by casual observers to be of brick, as the small diamond-shaped blocks, or wedges of

\* "The Architectural History of the City of Rome," based on J. H. Parker's "Archæology of Rome" for the use of Students. By Arthur Shadwell, M.A. Parker & Co.

tufa look very like brick at first sight; there are also at the angles blocks of large size, closely resembling modern English bricks, but rather larger; they are, however, of stone, with a flat surface, wedged or pointed off at the back, and driven into the concrete while wet before the lime had set.

Mr. PARKER tells us it is a mistake to suppose that marble was ever commonly used in Rome. The facings, cornices, columns, and whatever part was seen were often of marble, but for the other parts a less expensive material was adopted. Marble was in demand, and it would appear that our Devonshire "pudding stone" was much esteemed.

## STUDIES OF SOME LONDON CHURCHES.

(Concluded from page 79.)

MUCH as it is to be regretted that the splendid chapel at Ely Place, Holborn, did not become the church for the Welsh congregation in London, as had been hoped some years since, yet it must be a subject of congratulation, from an architectural standpoint, that in Roman Catholic hands the chapel has been so well restored, thus being utilised for those of the same faith its founders intended. The exquisite proportion of the side windows, as well as the beauty of the mouldings and tracery, cannot but strike the most casual of observers. This effect is materially aided by the great thickness of the walls. In fact, the reveals of the windows are so deep that one might almost imagine there was the Continental plan of a series of chapels between the buttresses, with arches opening out into the same. However, a second glance, showing the walls solid up to the window-sills, effectually does away with this notion. Again, how charming is the manner in which the slightly-projecting canopy work between the window-piers is treated, thus well connecting the composition, an object which the figures on brackets to the piers still further help. Turning one's eyes up to the roof, it must be seen at a glance that the design is unsuitable to the noble substructure on which it is mounted. In construction it consists of principal trusses, each of the common rafters also forming a species of truss. Though having evidently always been intended as open-timbered, the treatment does not seem good enough, or to sufficiently harmonise with the walls. There is no cornice, the spurs to each rafter standing directly on the top of the stone walls. Were this roof boarded on the under-side of the rafters, and ribs fixed, forming it into panels; were it painted, a good moulded cornice added, and a simple stone projecting course under the latter, how much superior would the effect be! But we must take things as we find them, and any such extensive addition to the features of Mediæval work might be considered not only impertinent, but almost sacrilegious.

The *Church of St. Martin*, Ludgate, designed by Sir CHRISTOPHER WREN, is remarkably picturesque and effective in plan, of a type which the great architect rather favoured, having a square as the governing idea. One can scarcely suppose that he was *always* tied to a site suggesting this proportion. To describe the church without referring to a plan is rather difficult, but must be essayed. Anyone who does not understand can easily go and instruct himself by examining the church, which is in no out-of-the-way locality. Picture a square subdivided into nine smaller squares. The central squares towards the cardinal points have semicircular vaults; the four squares in the corners have flat ceilings. The effect of this composition is good, though the middle portion of the church is a little dark, owing to light being only admitted from the north. This side seems comparatively open, considering it is in the City, and through the windows a peep of a splendid tree is obtained. There is a south gallery, treated plainly, without any ornamentation. The reredos is of a good type, judiciously gilded, and mercifully without any broken pediments. The columns are raised on very high pedestals, lined with oak panels, a feature too often found in churches of this date, for it always gives the uncomfortable idea of stone resting on wood; and though one knows there is a solid stone or brick pier behind the panelling, it would surely be better to at once show this, rather than shroud it up. The fittings are apparently as they were in WREN's time—high pews and a reading-desk with clerk's desk attached.

*St. Swithin*, London Stone, is another of WREN's churches, and, like the last-named, is square, but not subdivided. The plan of the square is altered into an octagon at the ceiling

level, and domed over, the soffite of the triangular parts being flat. The diagonal sides of this cupola have a kind of lunette, which, though well accomplishing its purpose of shedding light downwards, injures the effect of the paintings. Owing to the square proportions of the building, and its being of no great size, it was obviously impossible for Sir CHRISTOPHER to have contrived any chancel west of the sanctuary. The latter does not occupy the whole width of the church, and so the choir seats are placed north and south of it—much the best and the only practicable arrangement under the circumstances. To lay down hard and fast rules is easy, but when one has to deal with old churches, the structural formation of which renders compliance awkward, and in effect impracticable, it is wiser to throw the rules to the four winds of heaven, and do the best in other ways. It is in getting well over difficulties of this kind that the man of genius displays himself. The organ is placed on the ground-floor at the east end of the gallery, which has been cut away for that purpose. There are low seats, the church having been altered a few years since, but the old high, dark oak wainscoting still remains round the walls. It need scarcely be said this gives a very handsome appearance to the building. As regards the windows, it is a subject of regret that here, as in other of WREN's churches, a kind of Veneto-Italian tracery has been introduced quite out of character with the style of the architect.

The reader's attention is now to be directed to a far different structure—the fine *Church of St. Mary*, Dartmouth Park, Highgate, designed by Mr. BUTTERFIELD, and, as might be expected, showing many of the peculiarities of the master. The nave comprises four bays of equal width, with a shorter western bay. The area at the western end is left free of seats—always an advantageous arrangement when possible, greatly tending to dignity. There is a porch towards this end of the church, with a gable facing south; but the outer archway is towards the east, thus preventing draught. *St. Mary's* is very lofty, with open timber roof, a clerestory of some importance, and lean-to aisles, with windows of a good size in the latter. There is a curious and inelegant feature in the nave arcade. The mouldings are in two chamfered orders, which, instead of running straight down to the circular abacus, where they would of course dispose themselves comfortably, are stopped square-wise a little above the springing line of the arches, the consequence being that they encroach beyond the usual bounds of the abacus. In old examples one sometimes finds instances of this. It is one of the charms of Mediæval work that the architects were not so straight-laced as we are now in this respect—they did not mind departing from precedent where there was a valid and sufficient reason for so doing. But in this case there seems no object for the departure from the usual practice. There is another unusual feature in the aisle windows, which are ranged in recesses, and the spandrels filled in with brickwork in chequer patterns. Over the centre of the windows an intermediate truss occurs, a place where, if possible, one likes to avoid more than ordinary weight coming. There are "mask" label terminations over the nave arches. When one remembers the object of these ornaments, and the curious shadows they cast are called to mind, it seems scarcely worth while to reproduce in modern times this little fancy of the Mediævalists. The same remark applies to the gargoyles to the pinnacles of the nave parapet, which do not really throw out the rain-water beyond the walls, but are only make-believe. On the other hand, the water from the nave roof is conducted into transverse sunk gutters in the aisle roof—a very good plan, preventing ugly stains, and possible irruption of water under the tiles or slates when a strong wind is blowing. There is much that is dignified in this church, with its grand proportions, but some straining after novelty and a want of grace.

In the *Church of St. Luke*, Burdett Road, Stepney, we have a building designed in Mr. BLOMFIELD's characteristic style. It is plainly and substantially constructed of brick, and pointed internally. The plan consists of nave and aisles, with chancel and aisles. There is a gabled bell-turret over the chancel arch, in that position where of old the Sanctus bell-cot used to be located. It is a change to see a turret in this position instead of at the west end, the almost inevitable situation. The reason why the turret is generally placed westwards is plain enough, as it is more convenient to ring the bell in this position, and constructionally it is easier to carry. There is a clerestory of lancet windows, which occur both over the piers and the centres of the arches. A plentiful supply of

light from a height is very necessary, as there are no windows to the aisles, for neighbouring buildings closely abut on the sides of the church. The ceilings are of wood, cradle-shaped, that to the nave with tie-beam king-post principals. Last, not least, there is a very handsome mosaic reredos. Although, as may have been gathered from the previous remarks, nothing very novel is apparent in the design, it is always a pleasure to see something scholarly (to speak from an architectural point) and churchlike, and suited to its purpose, particularly in the East End of London, where the surroundings are generally commonplace and uninteresting.

*St. Peter's-upon-Cornhill*—the fine Wrenian church—has several characteristic features, and altogether much merits notice. The semicircular arches of the nave arcade are continued north and south, thus forming also the vault of the aisles, the latter in turn having semicircular openings between each bay. The piers carrying the arcade are set upon very lofty pedestals (the same height as the panelling round the church), which are panelled with oak. Before the church was reseated, in the year 1872, the pedestals must have looked in better proportion, when the pews were higher. There is a semicircular, carved, plaster ceiling to the nave. In the central panel, looked at longitudinally, are circles which necessarily are rather distorted in perspective, and are not altogether pleasing. The oak chancel screen is very effective, extending the whole width of the building with doorways opening into both the nave and aisles, the former surmounted by the Royal arms and supporters. The screen is composed of semicircular arches on piers, every alternate one having a pendant. This does not look amiss, and tends to less intercept the view eastwards. The east end, with its fine windows in the lower range (*i.e.* exclusive of the two windows to the aisles), and its three windows in the upper range, all filled with painted glass, has a striking effect.

Perhaps from the foregoing notes the reader may derive a little profit. It seemed worth while to collect these impressions jotted down from time to time. London is truly a wonderful city, and affords an almost endless fund of instruction to those who care to examine all its array of churches, ancient and modern. He is in truth a great traveller who knows all the ins-and-outs of its vast store of ecclesiastical architecture, good, bad, and indifferent. Excelsior!

### PARIS NOTES.

THE members of the special committee appointed by the Société des Artistes Français to study and report upon the best way of employing the profits realised from the 1882 and 1883 Salons, have held several meetings. It has been decided that a fifth of the profits, both of past and future years, shall be devoted to the relief of the most needy members of the association; a further sum will be set aside each year for the payment of substantial pensions to aged and invalid artists in poor circumstances, and to the widows and children of members who may need assistance; while special rooms are to be provided in the principal hospitals and almshouses of Paris for the reception of artists. Finally, the profits will bear the whole expense of the campaign about to be undertaken by the society in defence of art property. A special staff will have to be organised for carrying these several plans into execution. It has been recommended by another committee of the same association, which was charged to report upon the best means to be taken for defending the right of every artist to the absolute property of his productions, that a special agency should be established to look after the interest of members, and M. Tony Robert-Fleury has been requested to draw up the necessary report upon this important subject. The recommendations of both these committees will be submitted for approval at the next meeting of the Committee of Ninety, the supreme managing body of the Society.

Preparations for the Triennial Salon, to be opened on the 15th of next month, are being pushed forward with great energy, and the Palais de l'Industrie is at the present moment, as the French say, *dessus-dessous*—turned upside down thereby. The space occupied by this exhibition will be exactly the same as that taken up by the yearly Salon, and as the number of works to be admitted is strictly limited, every opportunity will be afforded for the adequate display of each exhibit. The nave of the great building is set aside for sculpture and architecture, the first-floor galleries being devoted to the paintings. The whole of the ground-floor

will be hung with Gobelins tapestries, lent by the Garde Meuble and the Gobelins manufactory itself, many of which have never before been open for public inspection. It is intended that the opening ceremony shall be of a most imposing character, and all arrangements for it will be made under the personal supervision of M. Jules Ferry, Premier and Minister of Fine Arts, who will preside on the occasion.

The French Government have decided to make, in connection with the Amsterdam International Exhibition, the following nominations and promotions in the Legion d'Honneur: Two Commander's crosses, five Officer's crosses, and fifty Knight's crosses.

A statue of the painter Henri Regnault has just been placed in position on the façade of the new Hôtel de Ville. The sculptor has represented him in the uniform of a National Guard, using the brush with the left hand.

M. Louis Edouard Dubufe, the painter, died on Friday evening in last week at Versailles after a long and painful illness. Like his father, he was known principally as a portrait-painter. His most popular portraits are those of *Jules Janin, Rosa Bonheur, The Empress Eugénie, The Princess Mathilde, The Marchioness de Gallifet, The Princess Ghika, General Fleury, Count Newerkerque, Dumas Fils, and Emile Augier*. He was sixty-three years of age, and had received innumerable medals. He was made a Knight of the Legion d'Honneur in 1853, and promoted Officer in 1869.

M. Alophe, who obtained great success at the Salon Exhibitions of 1846 to 1850, has just died of heart disease at Bourges. He was a pupil of Paul Delaroche, and made himself famous by his *Dernier Ami*, for which he received a first medal at the Salon. This picture represents an artist on his deathbed with no attendant but a faithful dog.

It has been decided that the annual sum of 3,000 frs., left by Madame Leprince to the Academy of Fine Arts, shall in future be divided equally between the successful competitors for the Grand Prix de Rome in painting, sculpture, and architecture. Consequently MM. Marcel Baschet, Lombard, and Redon, who obtained the awards of the jury this year, will each receive 1,000 frs. M. Redon, moreover, takes the Prix Delannoy of 1,000 frs., left by the architect of that name in 1867 to the Academy of Fine Arts, to be handed over each year to the winner of the Grand Prix in architecture; and M. Quatesons, this year's second Grand Prix, obtains 500 frs. from the legacy of Madame Lusson. On the other hand, M. Lombard having been awarded the Prix de Rome in sculpture, ceases to be the titular possessor of the *Bourse de Voyage* given him by the Salon committee, and which is now transferred to M. Cornu-Vital, who came second in number of votes at the election. Another prize founded lately is that of MM. René and Henri Chapelain, former pupils of the Ecole des Beaux-Arts. Under this foundation the Société Centrale des Architectes is authorised to award each year the sum of 1,000 frs. to the architectural pupil of the School of Fine Arts who has shown the greatest ability in the sister arts of painting and sculpture. The conditions of the competition, as established by the Society of Architects, are that the young architects who have gained the most class prizes at the school from May to May of each year in the section of decorative design, shall each send in a series of five water-colour paintings, and the 1,000 frs. prize will be awarded in accordance with the merit of these drawings.

The refusal of the Paris Municipal Council to sanction the proposed City Loan of 220,000,000 frs. for public works, necessitates the, at any rate, temporary abandonment of several important projects. Among these may be particularly mentioned the reconstruction of the Sorbonne; the building of the two public *lycées* or colleges proposed for the 7th and 11th Arrondissements; the construction of several new mairies and improvements to existing ones; the completion of the Avenue Parmentier, set down for 4,000,000 frs.; the continuation of the Avenue de la République throughout the 20th Arrondissement, estimated to cost 6,000,000 frs.; and the cleansing of the Bièvre stream, 3,000,000 frs. On the other hand, the 90,000,000 frs. required for the improvement of the city drainage system will probably be found, as the Council has referred this part of the prefectorial scheme back to the Works Committee for further consideration. The same remark applies to the scheme for the opening up of the Palais Royal, an account of which was given in a late number of *The Architect*. The expense of carrying out this project is to be borne in equal shares by the City and the Bank of France.

## THE DUBLIN MUSEUM AND LIBRARY COMPETITION.

THE following are the official conditions of the competition for the proposed Science and Art and National Library Buildings, Kildare Street, Dublin:—

The courtyard in front of Leinster House is not to be encroached upon by the new buildings beyond such projections before the general alignment of the façades as may be necessary to give character and effect to the design, and in the general arrangement of the buildings on their respective sites the extent to which it may be desirable to keep back the Kildare Street façades from the alignment of the existing buildings must be carefully considered.

It is desirable that the group to be formed of the two new buildings on the north and south sides of Leinster House courtyard should be in harmony with the architectural character of Leinster House.

The proposed National Library is to be placed on the north side of the courtyard, and in the arrangement of the design and in connection with it is to be shown on the portion of the site now occupied by the Schools of Art, the outline [in sufficient detail to admit of estimating the cost] of a new lecture theatre, laboratory and offices, for the Royal Dublin Society, in substitution for the present establishment on the south side of Leinster House. The design for this latter building (the new theatre, &c.) is to be so arranged as to admit of the postponement of its being carried out without affecting the erection of the library building.

The library is to be constructed so as to contain 800,000 volumes when completed, heated by hot water, with provision for security against fire and thieves, and for ventilation.

A general reading-room is to be provided with accommodation for a hundred readers, a separate room for twenty-four ladies, and two rooms for special students, with suitable cloak-rooms, lavatories, &c.

There will be required also a room for the meeting of the trustees, and rooms for the librarian, assistants, clerks, book-binders, and for storing books, &c., and the design must be so arranged that the postponement of any part of the buildings which may be placed on the portions of the site indicated by red hatched lines will not diminish the accommodation for books below 400,000 volumes.

The new museum buildings are to be placed on the southern side of the site, and are to be designed so as to admit of the postponement of the erection of any part of the building which it may be proposed to place on that portion of the site indicated on the map by red hatched lines now occupied by the lecture-theatre, &c., which while retained in their present position must not be injuriously affected by the interception of light or otherwise.

In connection with the design for the museum buildings, a sketch design for the schools of art proposed to be transposed from their present position should also be given in the same detail as that required for the new Royal Dublin Society theatre, &c., proposed to be transposed to the north side.

The greater portion of the area marked on the site map as the Shelbourne Yard will be available for this purpose.

The present Natural History Museum will be retained as such, and, together with the curved gallery, is to be connected with the proposed new museum building, so as to afford easy circulation throughout.

The design for the proposed new museum building should provide a total floor area of 74,000 superficial feet, including a general refreshment-room and retiring-rooms for both sexes.

The necessary store and preparation-rooms, arrangements for heating, &c., may be placed in a basement—due care to be taken in the construction to guard against risk of fire.

The new lecture theatre, &c., which is to be provided on the north side of Leinster House is to be connected therewith by a covered communication, and to be suitable for seating 500 persons exclusive of any gallery, with convenient access for the public; also rooms to be provided for chemical and physical experiments and apparatus, balance room, engine room, &c.

There will be two divisions of the competition; a preliminary one of sketch designs open to all, and a final one limited as hereafter described.

A committee of selection, one of whom at least shall be an architect (who shall not be a competitor, or interested directly or indirectly in either the preliminary or final competitions), will be appointed by the Lords Commissioners of Her Majesty's Treasury.

It shall be the function of the committee of selection to select from the designs submitted such a number—not exceeding five—as shall appear to them to be of decided merit, the authors of which shall be invited to compete in the second and final competition.

Separate conditions will be issued for the final competition. They will be in strict accordance with the above, so far as applicable, but with such additions or alterations as may be deemed necessary by the Commissioners of Public Works.

The commissioners reserve to themselves the power of publicly exhibiting the designs after the report of the committee of selection.

In the preliminary competition the designs of competitors shall be exhibited by sketch plans, elevations, and sections, to a scale of twenty feet to the inch, consisting of a plan of each floor, elevation of each façade, one section of each building, and a perspective view taken upon a picture line A B on the site plan; such perspective view shall be drawn to such a scale that the drawing shall not exceed the size of the other drawings. The perspective drawing shall be executed in pen and ink, without colour of any sort, save (at the option of competitors) a flat tint of Indian ink in the door and window openings, and on the roofs. In order to reduce the size of the drawings (which shall not be larger than double elephant) only such parts of the existing buildings as are affected by the design need be shown.

The geometrical elevations of the exterior and façades to the central courtyard shall be in outline only, without etching or shading of any kind, except that a flat tint of light Indian ink may indicate the clear openings of doors and windows and roofs.

There will be supplied with these instructions a general plan of the existing buildings, and an elevation of Leinster House—both to a scale of 20 feet to an inch—and sections of the site and of the buildings will be given, for the information of competing architects.

The entrances to the buildings will be from the courtyard, the present walls of which and the old buildings on the site are to be removed.

It is required that the entire cost of carrying out the design for the museum and library buildings to its complete and full extent, including any sculptural work and all architectural embellishments shown on the drawings, and all necessary appliances for heating and ventilating, with 10 per cent. for contingencies and architect's commission—but excluding internal decoration, painting, gilding and furnishing—shall not exceed the sum of 110,000/. The cost of the new lecture theatre, &c., and the new schools of art is not to exceed the sum of 12,000/., and any design adjudged to be likely to exceed these amounts will be set aside.

Each sketch design is to be accompanied by a description of the accommodation (stating the areas) provided on each floor, the total cubical contents of the building measured from the top of the footings up to half way between the wall plate and the ridge of the roof, an explanation of the material and mode of construction proposed to be adopted, and an approximate estimate of the cost, to which the competitor will be required to adhere in his matured design, should he be one of those selected to enter into the final competition. The description should further explain how the design can be carried out in segments so as to admit of the parts completed being occupied pending the final completion of the buildings.

The commissioners reserve the power of referring any or all of the selected designs to a competent building surveyor, to report on the probability of its being carried out for the amounts as above stated, viz., 110,000/. and 12,000/.

In the final competition, plans, elevations, sections, or other drawings to a scale of eight feet to the inch will be required, in which the author's sketch designs and no other shall be fully matured, and each of the competitors so selected shall be paid the sum of 150/. towards his expenses, provided he complies with all these conditions and those to be hereafter prescribed for such final competition.

On receiving the report of the committee on the final competition, the Lords of the Treasury will select the author of one of them for employment as architect for the new buildings.

The remuneration of the architect selected will be such a fixed sum as would be equivalent to 5 per cent. upon the amount which the Treasury may authorise to be expended upon the building, it being understood that the sum of 150/. is to be reckoned as part of this commission of 5 per cent., and his employment will be subject to conditions which will be stated by the Commissioners of Public Works.

Until after the award in the final competition is given and officially made public, no drawings or photographs, or written or printed statements descriptive of or alluding to any of the competitive designs lodged in either the preliminary or final competitions, shall be sent to any member of the committee of selection or to the public; nor shall any of the designs or copies thereof be exhibited publicly or privately, nor shall any canvassing of the committee of selection in favour of any particular design take place. The design of any competitor who shall violate this condition will be forthwith excluded from the competition.

Each design in the preliminary competition shall have a device or motto marked on each drawing, and be accompanied by a sealed letter bearing the same device or motto, addressed to the Secretary, Office of Public Works, Dublin, giving the name and address of the author, which shall only be opened after the selection is made, and for the purpose of ascertaining the names of the architects to be invited to send in plans in the final competition, or for the return of unsuccessful designs to their authors. Each set of drawings, if forwarded in a case, must be properly secured and sealed and marked on the inside of the lid, and in no other place, with the device or motto by which the drawings are distinguished.

All designs in the preliminary competition shall be deli-

vered, at the expense of the competitor, at or before twelve o'clock, noon, on November 15, 1883; any designs which may arrive after that time will be set aside, unless the delay shall be occasioned by accidents in transit, of which proof satisfactory to the committee of selection must be given.

The designs of unsuccessful competitors in the preliminary competition will be returned to them at the expense of the Commissioners of Public Works, but all the selected designs will remain the property of the Government.

### ART TEACHING IN FRANCE.

THE report of the Science and Art Department contains the following notes on a visit to Paris in May and June 1882, by Mr. T. Armstrong, the Director for Art at South Kensington, undertaken in accordance with the request of the Royal Commission on Technical Instruction by the direction of the Lords of the Committee of Council on Education:—

We visited the Musée des Arts Décoratifs in the Palais de l'Industrie. Among modern works the composition of Galland for wall decorations was most interesting. There are some casts of which we ought to have copies. The illustrated catalogue, the only one to be had, is incomplete. At 1 p.m. we went to the Direction des Beaux-Arts and took up M. Crost, who went with us to the Palais des Beaux-Arts, where we met M. Muntz, the librarian, M. Dubois, and M. Paul Colin. We looked through the fine collection of casts, saw the library, and visited the workshops of the moulders. There are many works here of which we ought to have copies, some for the schools and others for the museum.

There is a most interesting coloured cast of the della Robbia frieze at Pistoia. This, it seems, was cast for the French Government in 1832. It has been coloured or re-coloured lately, in imitation of the original, and varnished. The moulds, I was told, still exist in the cellars of the school, but are in a very bad state. I saw a cast from one of the reliefs at the base of Giotto's tower, which I have had leave to order for our museum, and also the whole of one of the gates (Florence Baptistery) and part of the other, which the Boston people wish us to join at casting. In the courtyard of the Palais des Beaux-Arts are many fragments of French Renaissance carved ornament, which are very desirable for our museum. Many of them have, I think, been cast lately for the new "Musée de la Sculpture Comparée," so they can easily be had. M. Muntz showed me his reproductions of Italian and other medals cast in plaster, to which a metallic lustre was given by the application of black-lead. He told me that very good casts were obtained, and they considered them quite as good for educational purposes as our more expensive electrotypes. I spoke to M. Muntz of my desire to find some good figure drawings (*académies*) for reproduction, by Flandrin or some of the best French artists, and he said he was about to make a selection from the drawings made by students of the school to which medals had been awarded.

In the evening we visited the Ecole Nationale des Arts Décoratifs in the Rue de l'Ecole de Médecine, formerly called "Ecole Nationale, de Dessin and de Mathématiques." The instruction is gratuitous, and boys of ten are admitted to the morning classes. For the evening classes fourteen is the limit, and all must be able to read and write. The students all begin with geometrical drawing, and go through a course of drawing from flat examples of human features, heads, and finally entire figures (*Bargue*), before being admitted to draw from the round, or what is called *l'antique fragmentaire*, a bust or a portion of a statue, and to the modelling of ornament. On the evening we were there some of the class were drawing from a cast of a hind's head and neck, cast from nature apparently, others from an antique bust.

We next visited the life-class, where a male model was standing. There were eleven modellers at work on the outer edge of the amphitheatre, and their figures were done (in relief) on ingeniously-contrived boards, which were attached to columns, and turned on a vertical pivot or hinge. Great economy of space was the result. There was room for two or three more modellers. The students who were drawing sat inside. They were not very numerous, but their small number was accounted for by a recent competition; for many of them, it is said, relax a little after the strain of extra work. The modelling from the living model did not seem to us so good as that of our best students in training and national scholars at South Kensington, but the average was perhaps better.

We afterwards saw the ornament class, composed mainly of boys from fifteen to eighteen. The room was quite full, and the young people were working with good spirit. The beginners have mouldings given them to copy first; and when they have mastered the sections they proceed to copy the ornament on its surface. They afterwards work from more intricate ornaments: from casts of flowers, from animals, and from heads; but all the work in this room is such as can be done while the student is seated at a desk with the example hanging on the wall before him.

The director afterwards got together, for us to see, a great number of drawings which had been done in a recent competition. These were executed in water-colours. One of the subjects given

was an arm-chair, and generally it was given in profile, in front elevation, and in perspective, while a full-sized drawing of the silk or other stuff to be used for the back and seat was added. We saw other designs executed in colours, none better than the best of those done by our national scholars, and a number of paintings in water-colours, the result of a competition, of large plants done from nature without backgrounds. This most interesting school we visited again to be present at the adjudication of prizes in a competition for modelling a group of flowers from nature.

On Friday, the 26th, we went by appointment to the Direction des Beaux Arts in the Rue de Valois to see the drawings made in the month of April by candidates for the diploma of professor (drawing-master) at what is called a "session." It is a sort of rehearsal for the examination which takes place in August. There was nothing very striking or interesting in these works. Those produced in Paris in the good schools stood in the same relation to the work from small country towns as the work done in our training-schools does to that sent up from the country.

In the afternoon we visited a drawing-school for girls in the Rue de Seine. This school was founded in 1802, and was for some time under the direction of Mdle. Rosa Bonheur. The teaching is free, and students are admitted from twelve to twenty-five. It is kept up by the State. There were 140 girls present at that time, and 338 inscribed in the books. The hours of attendance are from ten to three. All the students sat rather closely packed in one low room, lighted from the roof, which was in ridges. This mode of lighting was very suitable to the work they were about. Although they were rather close together, and it was not easy for the teachers to move about among them, they had room enough for their work, and each had a good view of the example she was copying. We saw them drawing from four plants and four casts, ranged alternately on the same line. The plant at the end where the beginners were working was simple in its forms, while the succeeding one was more complex and difficult to draw. So with the casts, which ranged from simple geometrical reliefs to the Psyche (Naples). We saw some still-life paintings which were very good, and a great number of coloured designs which were excellent. The best had been done in a competition, and we were told that the average attendance of the girls who had done the best designs (for a cup) was four years.

On May 27 we went to see the new collection of casts at the Trocadero, called Le Musée de la Sculpture Comparée, which is for the most part national. It is, as far as may be, chronologically arranged, with here and there examples from the art of other countries—Assyrian, Greek, and Italian Renaissance. Some of the draped figures from the Gothic cathedrals are of extraordinary beauty. We should do well to follow the example of the French and get together a collection of casts from Gothic and Renaissance sculpture, arranged chronologically. In the afternoon we went by appointment to the Ecole Nationale des Arts Décoratifs to be present at the judging of works in a competition of two sections of modellers. The judges were M. Millet and another sculptor, M. Hedin, engaged on works for the Paris municipality.

On Tuesday, the 30th, we visited the school in the Rue Tournefort, which is a technical school (*école professionnelle*). The boys come in from ten to twelve years of age. They all have four hours a week for drawing—one lesson of two hours, and two lessons of one hour. There is no drawing from flat examples. We saw the books they keep (*livrets*) of the work they are executing in the technical part of the school, the joiner's shop, or the smithy. We inspected four of these books by boys of twelve and a half, thirteen, fourteen, and fifteen years respectively. Boys from eleven to thirteen make in one and a half hours a model in clay in low relief, from a pattern drawn on the squared blackboard, about the size of a tile; this is a lesson in composition. The very little boys modelled on slates from an example done before them on the blackboard. While the class was sitting the master called on the boys for modelled compositions; these were first drawn in white chalk on the slate, and then done in clay. Modelling is done from casts first, and afterwards from shaded lithographs. We saw a composition, a pattern, by a child of six years at its third lesson in clay. When a boy has chosen his vocation he has three hours a week for modelling or carving in wood or stone.

There were 250 boys in the workshops. They carry about in their pockets the bits of wood or iron on which they are working. Little children, from six to nine, begin to draw on squared paper with coloured pencil. The master draws on the squared blackboard some familiar object—a toy, a house, or an animal—and it is copied on the squared paper. The squared paper is used also in the *asiles*, or *écoles maternelles*, for very little children. The younger boys are encouraged to do drawings at home, for which they get little prizes, such as very small coloured lithographs. Perspective is taught at the beginning on the squared board. For composition one hour a week is given, which for some of the pupils makes a total of five hours a week given to art work. Children leave the *asiles* or *écoles maternelles* at six. While there they draw, but in the *écoles primaires*, to which they go afterwards, they do not draw until they get into the first class, and thus about four years are passed without drawing.

On the 31st we went to inspect a girls' drawing school in the

Rue du Vieux Colombier, kept by Madame Thoret, called *une école libre*. It receives from the Paris municipality a subvention of 3,000 frs. annually, as well as the rent of the rooms, the cost of gas, and of a porter. For these considerations the school is bound to take 25 free students three days a week; actually there were 55 such students. Drawing only is taught on the days due to the State. There are lectures in perspective and anatomy; 160 girls were on the books, 128 present. On the days not due to the State painting is taught.

In the evening of the 31st we went to the municipal drawing school in the Place des Vosges, which was admitted to be one of the best of its class. Here the boys who have never drawn at all begin from flat examples of ornament, and as soon as they can shade a little they go to object drawing. The more advanced students study ten days from the living model, ten days from the antique, and ten days from ornament and plants. There is a course of anatomy and one of composition; on the books there were 376 inscribed, but the average attendance was said to be 95, and there were 76 present. There is a competition every month. Apprentices attending the schools have books (*livrets*), which are signed, for the satisfaction of their employers, at every attendance. I saw here a young Englishman, a wood-carver, who had formerly been a student at the West London School of Art. The master told me he was a good student. He seemed intelligent, and I asked him how the workmen of his trade in Paris would compare with those of a similar class among whom he had been in London. He said the Paris cabinetmaker or wood-carver had generally an advantage over the Englishman in being able to express or set out by drawing the work he was going to execute. He thought the Parisian more rapid, capable from skill or temperament of getting through more work in a given time, but working shorter hours or fewer days than the Englishman. In this school the lighting by gas was excellent; the casts were sharp and good and clean; the seats, too, were admirably contrived. There was in one room a contrivance for a double drawing-board of rough glass, which takes colours, as well as chalk and charcoal.

On leaving the school in the Place des Vosges we went to a similar one in the Rue Bréguet, but the students had left. The next morning, June 1, we went to the same building in the Place des Vosges and saw the drawing class of an elementary school, *école primaire*, and also an *école maternelle*. In the elementary school the children are from six to fourteen. Drawing is supposed to be done at once from plaster objects; actually flat examples are tolerated for a time, though forbidden by the rule. Here we were told that children were six years in the school before reaching the drawing-class. We saw the first-class rehearsing for a competition for a certificate called *de bonnes études*. They were sketching rapidly, from a plaster model of vine leaves. There are three divisions or classes; the middle one was drawing from plant forms in plaster, and the lowest from geometrical forms also in plaster. The examples were fixed against upright stands or poles, good casts, well lighted. There were 53 places in the room, and 50 boys were present. In the class of boys of six, geometrical drawing is done on slates. All the pupils of the two first classes are not in the drawing classes. The boys have one lesson of two hours and two lessons of one hour. The girls have one lesson of four hours (Thursday). We saw the *école maternelle* in the same building. The children were not at work, but we were shown their exercises done on the Froebel system.

I had heard that the schools of the Christian Brothers had been successful in their teaching of drawing, so I went to the head house in the Rue Oudinot to try and get permission to visit one of their schools, which are not under State or municipal control. I waited some time, but was not able to see any one in authority.

On Friday, June 2, we went to Lille, having written beforehand to the mayor. On our arrival at the hotel we found M. Marteau, architect of the town, awaiting us, and we went at once to the schools in order to see the classes which break up at seven. Here we saw elementary drawing, which we found interesting. The beginners had slates, about 30 inches long and squared out, fastened against the wall, and the boys had their examples alongside on small sheets of squared paper. Besides blackboards or slates fastened against the wall, there were others with a hinge at the top attached to a bar. The seated student had the lower edge of the slate on his knee. At first lines were done—horizontal, vertical, and diagonal; then angles, squares, circles, and curves, leading up to elaborate symmetrical patterns, done with white chalk, and without instrument or measuring. One very elaborate pattern was done by a boy eleven and a half years old, who had been taught drawing three or four months from the very beginning; another by a boy of twelve, who had been working six months; another, which seemed one of the best, was again by a boy of thirteen, who had learnt six months. We were told that about ten sittings of two hours each were required for the execution of the most elaborate patterns we saw. These are evidently kept as show pieces, for one of them still on the slate had been done in November, and we were then in the month of June. When a boy has gone through his course on the slates he does the same thing on paper, drawing his patterns first in crayon and then in ink.

For the whole course of blackboard and paper a good student requires one year. They work at drawing two hours a day on

five days of the week; the boys next go to a class where they draw from flat examples of figure and ornament, doing first eyes and noses and shaded heads, then charcoal *académies* after Jérôme, to learn how to put together a figure, and shaded figures by Barye. In working from the flat examples, they must do one drawing with hatching; they are allowed afterwards to shade with the stump.

There is a life class, where the nude model sits two hours on five days of the week. In this class-room we saw eleven students drawing from the life, and eight from casts. There is another living model sitting four hours daily (in costume) for a painting class. The students in painting begin by copying still life, plaster hands, and bits of silk. In the modelling-class the living model sits two hours a night for three weeks, and during the succeeding three weeks the students work from the antique. When we returned later in the evening to see the artisan classes working by gaslight we found three students modelling and two drawing from a cast of the *Venus of Melos*, others doing fragments, beginning with eyes, noses, &c. There were nine modelling stands. The modelling was pretty good, but the two drawings we saw in progress from the *Venus* were not so. Modelling and drawing go on concurrently. There was drawing of ornament from flat examples, also from casts (badly lighted), and from plants.

Some students were drawing ornament in indian ink after a course of stumping. We saw elaborate drawings of ornament being done from the flat, principally by decorators. There is a competition for colour, and we saw small bas-reliefs of figure subjects which had been produced in the modelling class. They were very good, and were said to have been executed between 8 a.m. and 6 p.m.

The next morning we were taken to an exhibition of industrial art, where a collection of the drawings done in the school was exhibited. Coloured designs and architectural drawings figured among them. There was nothing equal to the work done in our training-school, or in the *Ecole Nationale des Arts Décoratifs*, or the girls' school in the Rue de Seine in Paris. The jute industry flourishes at Lille, and we saw most beautiful stuffs made of it in the exhibition.

After visiting the town museum and the Préfecture, I returned to Paris in order to see a competition of working men, which took place the next day, Sunday, in the orangerie of the Luxembourg. I went to it when the time allowed was more than half over. I found 360 working men there between the ages of fifteen and thirty, who were allowed from 9 a.m. till 5 p.m. to make a shaded drawing or a model from a cast of ornament. A school having from ten to twenty-five students may send up three to this competition, and so on in proportion until one with a hundred and seventy to two hundred may send fourteen. In judging, the bad drawings are thrown out, and for every one considered admissible 5 frs. is given. The highest prize is 100 frs., and there are others of 75 frs., 50 frs., and 25 frs. The arrangements were admirable, and so was the behaviour of the students.

In this report I have stated briefly such facts as I could gather and take notes of in going through the schools when I had all the time to be using my eyes to form an opinion as to the quality of the work being done. I have but seldom expressed an opinion in this paper. In conclusion, I may say that we saw evidence of great activity in art education for the artisan class among the French. The State gives with a liberal hand, and the municipalities seem to vie with it. For the current year the Paris Municipality has voted 800,000 frs. for drawing schools. The instruction is quite free. Great efforts are being made to train better teachers, and here the higher instruction of the *Académie des Beaux-Arts*, with its fine traditions, had furnished a class for which we have no equivalent in England, and from which inspectors and other superior officers can be taken. In the schools pains and money are not spared to give to students fresh, sharp casts, kept clean, to draw from, and to place them in the best light both by day and night. These are matters of the first importance. The Department would do well to procure specimens of some of the fittings we saw. In one school where the lighting struck us as admirable, we ascertained that the lamps used to light the students' work cost 30 frs. each, those to light the model 150 frs., and those for the modellers, which can be moved up and down, 125 frs. Some of the seats and desks, too, might be procured. In all the best schools we found a desire to eliminate flat examples where they remain, and to let the students draw from objects. I ordered some of the plaster models most in use for beginners, and they are now in our schools. In these matters the position of the French resembles our own; they are obliged in some cases to tolerate examples known to be bad for want of better. There is in use a substitute for the blackboard made of rough glass; it takes washes of colour as well as charcoal and white chalk. The cost is 200 frs.

Messrs. J. Boyd & Sons, of Paisley and London, inform us that they have just completed fixing two new boilers for the Botanic Gardens at Glasnevin, county Dublin, which will be in operation during the month, and will abate some of the evils that have affected the gardens, and which were referred to in a "Note" in last week's *Architect*.

## NOTES AND COMMENTS.

A COMMITTEE has been formed in Stockholm, with the Prince Royal as president, to make arrangements for a Scandinavian Industrial Exhibition, to be held in Stockholm in the summer of 1884. It is proposed to erect the building on a plain, called Ladugardsgärdet, in the outskirts of the town. A temporary railway will be laid down for traffic and passengers, whilst steam-launches will be employed for conveying the latter by water to within a few minutes' walk of the exhibition. An elevated and open site will be chosen for the building, and the surrounding grounds are to be tastefully laid out with turf, flowers, and fountains. The total disbursements in connection with the exhibition, after deducting the value of the materials of the building, are estimated at 1,166,000 kronor, or 64,777*l.*; the receipts at 366,000 kronor, or 20,322*l.* An area of 314,250 square feet will be allotted for the exhibition building.

THE Dean of CHESTER has resolved to complete the restoration of his cathedral, which has been already almost transformed by alterations. It is necessary to appeal for funds for the works, which are estimated to cost at least 15,000*l.*, and will be directed by Mr. BLOMFIELD. The Cathedral Commissioners say it is clear, from various records, that the cathedral establishment of Chester was intended to be a large and important one, and to have a position of high distinction and wide influence; and its first Charter of Dotation (33 HENRY VIII., August 5, 1541) endowed it with ample means to support such a position. But its property was greatly diminished by the alienation under Queen ELIZABETH in 1582 of a large portion of its estates to laymen, advantage being taken of the omission of the word "Cestriensis" in the original charter. From that time to the present the cathedral has been struggling with difficulties. It has no special fabric fund though its need is very urgent.

THE appointment of Major COLE, R.E. (a son of the late Sir HENRY COLE), to be Curator of Ancient Monuments in India, will do much for the preservation of Eastern architecture. From his first report it is evident that, if some of the buildings are to be saved, the custody of them must be undertaken by the Government. Major COLE reports that "the great pillared Diwan-i-Am at Delhi, with its fine marble mosaic canopy and throne, is used as a canteen, and on the right of the throne is a bar for serving out liquor! To the left of the throne is an enclosure of bamboo screen-work, in which NUBBI BUX keeps a soldiers' coffee shop. Above and at the back of the throne is a small open apartment, the walls of which are faced with the celebrated black marble mosaic work; but this, as well as the inlaid patterns on the throne, has been villainously repaired in coloured plaster." It is fortunate for the buildings that the authorities in India rarely have opportunities to manifest their loyalty. According to Major COLE, another palace, "the Diwan-i-Khas, has been disgracefully treated. To prepare for a ball given in honour of the Prince of WALES, the moulded fretwork of the wooden ceiling in the centre of the building was repainted in black and gold and red, instead of white and gold, the original colours, and the central rose was converted into a sort of starved star-fish." A good many instances of similar treatment of Eastern art is recorded by Mr. FER-GUSSON.

THE opening out of the great Roman bath in the city of Bath is due to the energy of Mr. DAVIS, the city architect; and if it were not for his enthusiasm, the excavations must have been suspended soon after they were commenced. It is to be regretted that some time ago the Corporation did not estimate Mr. DAVIS's services at more than one-half their real value. But now that the work has been accomplished a better spirit prevails in Bath, and Mr. DAVIS has again asked the Corporation to consider his claim. It was admitted by some of the members that Mr. DAVIS had worked early and late to secure the success of the excavations, and accordingly the subject has been referred to the Baths Committee, who, we trust, will be appreciative of what has been done.

A MEETING has been held in York to organise a committee for the publication of the history of Yorkshire. Already the project has secured the support of a great many archæologist

and topographers. It is proposed to send circulars to all the clergy and landowners, with a request to fill up certain forms containing questions. The returns will then be arranged and published in the form that is considered most suitable. The expense will, however, be great, and may amount to at least 2,000*l.* for each wapentake. It is understood that the gentry of Yorkshire are willing to give all the information that may be found in their houses, and to contribute towards the cost. At present opinion is in favour of a series of volumes, giving the history of each district separately, rather than of a few colossal volumes like those which give the histories of some other counties.

THE fire at the private lunatic asylum in Southall ought to be a sufficient warning to the authorities of the dangers of those institutions. It is well known that throughout Great Britain nearly all the private asylums are no more than private houses, which have been utilised for a purpose for which they were not designed. Many of them are old-fashioned, and consequently possess fewer conveniences than are found in modern houses. In them a great number of people are often lodged who are not likely to be self-possessed in the case of a fire or other danger. It is a remarkable fact that although the Commissioners of Lunacy are supposed to examine the condition of private asylums once a year at least, they are not accompanied in their visitations by an architect, who might point out the defects of the buildings. At Southall there were no appliances to be used in case of fire, and there was an insufficient supply of water. The consequences are known, and the owner, his servants, and some of the inmates have lost their lives. In the same district there are many private asylums in which the risks are even greater. Is it not time that adequate care should be taken to protect the unfortunate occupants of such buildings?

THE beauties that surround Torquay are sufficient to inspire an artist, and it is not surprising that a good many painters have lived there. Among others are the following Devonshire men: CHARLES EDMUND CROFT, of Torquay, painter in oils and water-colours, born at Plymouth, 1838; SIDNEY S. MORRISH, Clare House, Torquay, born at Exeter, a frequent exhibitor at the Royal Academy; JOHN SALTER, born at North Tawton in 1825, settled in Torquay, portrait and landscape painter; CHARLES WAY, sen., born at Dartmouth in 1805, settled at Torquay 1826; and WILLIAM COSSENS WAY, born at Torquay, 1838. But at present Torquay does not appear to be so attractive to painters as some other parts of Devonshire, and views of the scenery are rarely seen in exhibitions.

AT a time when attention is given to the principal work of the late ALFRED STEVENS, it may be noted that the *Magazine of Art* for the present month contains several excellent engravings of his fine sculpture in stone and wood at Dorchester House. The building was remodelled by the late Mr. VULLIAMY, and the great staircase has been effectively planned. STEVENS's work would, however, give value to a less splendid mansion. The mantelpiece is supported by a pair of figures that will not suffer if they are compared with the *Slaves* of MICHAEL ANGELO. The sculptor knew that in the Park Lane house he had a patron who was able to appreciate his work, and consequently we there see him at his best.

SOME of the Spanish cities are adopting the system of large houses divided into flats. In Malaga many buildings of the kind are in progress, and, in consequence, the narrow but picturesque streets which were suggestive of the Moors have been removed. But with Parisian buildings the old indifference to cleanliness remains. The English consul is compelled to say that it would be difficult to discover a town of the size of Malaga where sewerage is so much neglected, or the streets are kept in so uncleanly a state. The place is saved from pestilence by the salubrity of the climate, which is unsurpassed in Europe. Malaga is well adapted to become a winter abode for invalids; but English visitors after a short time are compelled to fly from it owing to the disregard of sanitary regulations, and as yet no one has had sufficient enterprise to erect an hotel outside the city.

## ILLUSTRATIONS.

INTERIOR OF THE CHURCH OF ST. MADELEINE, TROYES.

WE publish this week a reproduction of a water-colour drawing by Mr. BARRAUD, which was exhibited this year at the Royal Academy. Architects will welcome the accession of Mr. BARRAUD among architectural artists. They have long known him as an artist in stained glass and other kinds of decoration. From Mr. BARRAUD's acquaintance with Mediæval buildings, and skill as a draughtsman and colourist, excellent representations of architectural work may be anticipated.

Troyes is one of the few French towns which has not undergone a complete metamorphosis, and is in consequence a favourite sketching-ground. The church of St. Madeleine has been altered, but much is left to delight the artist, and especially the beautiful screen shown in the illustration. It was carved by JOHN GUALDO, an Italian, in the early part of the sixteenth century. The sculptor was buried in front of his masterpiece.

NEW PREMISES, WOODHOUSE LANE, LEEDS.

THIS building has been recently erected by Mr. RICHARD WOOD on the site of his old premises. On the ground floor there is a large shop, with exit at back to slaughter-house, yard, &c.; an entrance from the street leads into the hall, with doors opening into dining-room and back part of house. A staircase in the entrance hall gives access to sitting-rooms and bedrooms on the first and second floors. The shop has been fitted with all the most recent improvements. Wrought-iron tram lines, suspended from the joists on first floor, run all round the shop, and to the slaughter-house. These have been specially designed by Mr. WOOD, and so arranged with junctions that meat can be conveyed to any part of the shop without being taken off the lines. The walls have a marble dado 5 feet high all round, with marble slabs supported on wrought-iron frames; above the dado is tiled with MINTON'S white glazed tiles. The floor is tiled, and the ceiling is panelled in pitch pine stained and varnished. The office screen and rest of woodwork in shop is in pitch pine stained and varnished. In the shop-front there is a large wrought-iron sash and frame which can be lowered into the basement by a mechanical arrangement. Ventilation is secured by an open grille over shop window, and flues have been left in the wall for carrying away the vitiated air. The materials for the front are best pressed bricks and stone dressings. HAYWARD'S patent pavement lights have been used for lighting the cellars. The contractor for the whole of the works was Mr. JAMES WOOD; the ironwork and fittings by Mr. E. OLDROYD, engineer. The architects were Mr. E. BIRCHALL, F.R.I.B.A., and Mr. W. A. HOBSON, of Leeds.

DESIGN FOR CHURCH OF ALL SAINTS, IPSWICH.

THE design reproduced was submitted by Mr. EDWARD J. DODGSHUN, of Leeds, in the recent competition. The materials proposed to be used were local red bricks with Bath stone dressings. The roof timbers would be of pitch pine. The plan was arranged to accommodate 800 worshippers.

WEST FRONT, KIRKSTALL ABBEY.

THIS illustration is from a drawing by Mr. J. B. WILSON, of Leeds. An excellent description of the abbey by Mr. J. W. CONNOR, F.R.I.B.A., was lately published in *The Architect*.

## THE ELECTRIC LIGHT AT THE SOUTH KENSINGTON MUSEUM.

THE annual report of Lieut.-Colonel Festing, R.E., supplies the following information on the employment of the electric light at the Museum.

There not being at present space available for more steam-power, it has not been possible to extend the electric lighting of the Museum, except to the extent of putting 18 more incandescent lamps in the temporary Art Library. The apparatus has all worked well, and there has been no accident of any kind. The cost of 32 arc lamps for the year, including fuel, oil, &c., for the engine, carbons, and wages has been 185*l.*, or 2*2* pence per lamp per hour, the same figure as given in my last report.

The saving in gas as compared with the average consumption of the last four years before the electric light was introduced has been at the present price of gas, 1,007*l.* A portion of this saving is probably due to increased care in the supervision of the gas; but the bulk must be certainly put down to the introduction of the electric light, for besides the direct saving resulting from difference of cost per hour of the electric light and gas, which I estimate at 85*8*%, a further saving results from the fact that the electric light is started simultaneously exactly at the time it is wanted, whereas it takes some time to light all the gas, and therefore the lighting has to be commenced before it is actually wanted. I find, by dividing the total annual consumption in the Museum by the hourly consumption taken by the meters, that the average number of hours that the gas is lighted in the year is 700. The electric light was at work for 627 hours last year; there is therefore a further saving of 73 hours of the gas displaced by the electric light, which amounts to 99*l.*, which brings the total saving in gas to 957*l.*; deducting the total cost of the electric light (185*l.*), the net saving is 772*l.* per annum, or about 41 per cent. on the outlay, which has been 1,900*l.*

In estimates of the cost of electric lighting we frequently see such sums as 10, 15, or even 20 per cent. per annum put down for "depreciation of plant." Our experience here affords no confirmation for such exorbitant figures.

One of the dynamo electric machines has been at work now for 34 months; at the end of 28 months we had a new set of brushes, costing 8*s.*, or at the rate of 3*s.* 5*d.* per annum; at the end of 32 months we had a new set of commutator plates costing 15*s.*, or say 5*s.* 8*d.* per annum, a total of 9*s.* 1*d.* per annum, or  $\frac{1}{6}$  per cent. per annum on the cost. The other machine has so far cost nothing for repairs, and I am unable to detect any loss of efficiency in either machine. Nothing has been spent on the repair of the lamps or other parts of the electric apparatus. On the steam engine, which we have had at work for about 2½ years, 5*l.* 10*s.* has been spent on new furnace bars, and I believe the engine and boiler to be substantially as good as ever.

The importance of introducing electric light into the art schools has been urged upon me by the director for art and the principal of the schools. So much inconvenience is felt from the heat and fumes of the gas, that the substitution of electric light would be an enormous benefit. I have tried several experiments, but one great difficulty has been the want of motive power. The only power available is that of the gas engine; but this is required for lighting the library on the nights when it is open, and it would not do to introduce electric light into the art schools on some nights only, as the continuity of the work would be destroyed. Through the courtesy of Messrs. Sellon & Volckmar, however, I have been able lately to try some of their storage batteries. These can be charged by means of the gas engine at any time, and are available for the supply of electric current when it is wanted. They are best fitted for working incandescent lights, but the colour of these is not much better than that of gas; it is therefore very desirable to have an arc light, but there are difficulties in getting one to work properly with storage batteries. I have now, however, obtained a Pilsen lamp, which so far appears to answer well, and therefore, if we find that the storage batteries themselves work satisfactorily, I think we may consider that the difficulty is solved, and that we may be able to light at all events the most important rooms in the art schools by electric light.

## KENT ARCHÆOLOGICAL ASSOCIATION.

A MEETING of the Kent Archæological Association was lately held in Ashford, when some of the buildings in the neighbourhood possessing archæological interest were visited. The annual report was read by the secretary, the Rev. Canon Scott-Robertson. It stated that the condition of the Society was satisfactory. The council had undertaken the task of obtaining particulars of all the church plate in Kent. The council had already received particulars of 220 sets of communion plate. Among these were found no less than fifty communion cups, and one curious stoup or flagon, made in the reign of Queen Elizabeth, and which had been in use for more than three centuries. One tall, covered cup of great beauty, made by the renowned silver-smith of Nuremberg was amongst those still in use, and there were others of similar character and beauty, but of English workmanship. Instances had been discovered of at least three gifts of plate to parishes during the period of the Commonwealth. No stirring discoveries had been made during the past year, but a well-preserved hoard of 1,850 Roman coins, chiefly small brass, of the reign of Maxentius and Constans, had been discovered in Cobham Park, not far from the Earl of Darnley's house. These coins were being classified by Mr. Roach Smith.

After a paper had been read on the history of the Ashford Grammar School, the members visited Hinxhill, which was formerly called Hengeytele.

A paper on the church was read by the rector. The building had, he said, no pretension to architectural beauty or to archæo-

logical attraction. Its tower and earliest features are Early English, the walls being chiefly of Kentish rag. It was probably built early in the thirteenth century, and is dedicated, like many other churches in the neighbourhood, to St. Mary. It had originally only a nave and a chancel, but the very narrow north aisle was added in the fourteenth century. At a more recent period still, probably early in the seventeenth century, the chancel or chapel, as it was called by Sir Stephen Glynne, at the east end of the north aisle, was made, the original north wall having been clumsily cut through, and the outside wall of the narrow aisle extended to its present length. A large and ugly square three-light window in the east wall of that chancel has recently been filled in, and a stained-glass lancet placed in its stead, the glass having been put in by the late Mr. Thomas Startup, of Ashford. A small aumbry in that chancel was probably removed from this chancel to make way for the Edolph monument. The window in the north wall, which corresponds with the two light decorated windows in the south wall of this chancel, was probably taken out of the original north wall and inserted in its present position, the upper part, of which there are external traces, having been cut off for the want of space. The arcade of the nave consists of three pointed arches upon circular columns, with octagonal capitals. The arch, which divided the nave from the chancel, probably fell or became unsafe, and was removed in the year 1633, tie beams having been inserted for the support of the outer wall. The tower, at the west end of the church, is surmounted with a single spire, and it is recorded that, "on the 23rd of December, 1796, about six o'clock in the evening, during a violent thunderstorm, the steeple was struck by the lightning, the upper part of it being burnt down, and the rest of it considerably damaged; but it was wholly rebuilt and repaired in the following year." An unsightly gallery, which hid the upper part of the tower arch, has been recently taken down, sittings equal in number to those which were sacrificed having been provided in other parts of the church. This tower arch is built of chalk, as are also the jambs of all, or most of, the earlier windows. The remarkable door of the vestry—the inner door—is probably contemporaneous with the church, and, if so, must have been the door of the original south entrance, now only seen in the external recess of the wall. The font—a square bowl on a cylindrical stem and four detached legs, on a square plinth—has lately been removed from the north-west corner of the narrow aisle to its present more suitable position. The reading-desk and pulpit were constructed out of a handsome oak screen, which at one time parted the two chancels. Here is one small brass to the memory of Robert Gateley, dated 1518. A beautiful monument, with kneeling effigies (at the north of the communion-table), was erected by his widow, in 1632, to the memory of Robert Edolph, Esquire, who died in the previous year.

The building that was next visited was the old church at Brook Hill. Canon Scott-Robertson called attention to the Norman tower. It is three stages in height, and each stage is larger than the one above it, so that the tower tapers as it ascends. Its base is very large. The length from east to west (about 27 feet) exceeds the length of the chancel by nearly 6 feet, and falls little short of the length of the nave, which is only about 9 feet longer than the tower. At the south-east corner there is a remarkable turret-stair. Externally the turret resembles a large flat buttress, of six stages, tapering, each narrower than the one below it. Three very small round-beaded windows light the newel staircase. It resembles those which Prior Ernulf built, and probably is of the same period—viz. A.D. 1100. In the second stage of the tower is a chamber, from which three open Norman arches, like windows, in its east wall, gave a view of the high altar and of the body of the church. The central opening was blocked up at an early period, and upon the plastered surface of the western face of the blocking masonry fresco was painted in distemper. It represents Our Lord in glory. It is generally supposed that this was a priest's chamber. The presence of an altar in so unusual a position may suggest that it was at one time occupied by a priest, who had taken upon him vows of seclusion as an anchorite, after which he never left this chamber. Aloft, in the upper stage of the tower, are three bells, all founded by Joseph Hatch. The biggest bears this inscription: "Joseph Hatch made me, 1612." The tower opens to the nave by a lofty Norman arch 15 feet wide; it is adorned with the cable moulding. The nave has, high up in its south wall, two lofty Norman windows of the simplest design. The walls of the nave were painted, probably in the thirteenth century, with a series of frescoes in distemper. On the south wall there was a double series of subjects in two tiers, each tier containing ten arches, having the figures depicted in red. They have all been whitewashed over, but the wash has now been scraped off, and confused traces of the subjects are alone left to meet the eye. On the north wall the paintings are fainter still. Over them, in Elizabethan or Jacobean times, texts were painted. We can still detect the words: "Be ye doers of the Word, and not hearers only, deceiving your own selves;" and "To do good and to communicate forget not," &c. A very handsome rood-screen was inserted in the Norman chancel arch about 1502-1518. Over the Norman chancel arch the decalogue and the Royal arms now stand. Formerly there was on or before the rood-loft a light called "The Cross Light." He found mention in this church likewise of the "Light of

St. Nicholas" and of "The Torch Light." Thomas Churchman, who bequeathed small sums of money to these lights in 1525, directed that during twenty years after his death an obit should be kept in this church after the following manner: Every year two bushels of wheat were to be baked, and so given in bread to the poor; and two bushels of malt were to be brewed, and given away in ale, after one mass and one dirge had been sung on the anniversary of his death. Entering the small chancel, they saw that its three walls had been entirely covered with fresco painting, in circular panels or medallions. The method of the mural decoration is remarkable, and, so far as Kentish churches are concerned, it is unique.

Mr. Furley said that the manor-house, the church, and the mill were in close contiguity—each within a few yards of the other. It was the custom of the lord of the manor to build a mill for the convenience of his tenants. It was supposed that Wye was built two miles from where the present Wye now stands, and that the whole of the valley was covered with water, upon the recession of which the town was brought down the hill to its present site. Here in Brook was a property belonging to the Chapter of Canterbury, as complete as any that could be found; the right of pannage, or sending hogs to feed on the acorns in the denes of the Weald, being, among other rights, connected with it in the eighth and ninth centuries.

The church of All Saints, Boughton Aluph, was also described by Canon Scott-Robertson. Ninety years ago, he said, the chancel of this church was entirely blocked off from the nave by huge folding doors. The nave was filled with tall pews until a few years ago, when the present incumbent got it resealed. There was a church here when the Domesday survey was taken, but of it we can find only one fragment now remaining—the base of the central column of a short arcade between the high chancel and the north chancel. That Norman edifice was improved and restored during the thirteenth century. Of the Early English restoration we can now see the piscina-niche wrought in chalk, with its straight-sided pointed arch; the sedilia, with well-moulded hood, also in chalk; and probably the two north-western windows of the north chancel. Whether the strangely-large square turret at the south-east angle of the central tower was the Early English tower of the former church is a question which deserves attention. It is certainly not coeval with the central tower. This turret is of two courses, and the upper course may probably have been an addition. Built of flint, and square on the exterior, the turret is now lined with chalk blocks internally, and they are so cut as to make the interior of the turret circular. In the fourteenth century, it would seem, the church was greatly enlarged and richly adorned with stained glass; being made cruciform in plan. The arches of the nave arcades are very lofty; their upper members are formed of chalk, their octagonal shafts are graceful, and the loftiness of the arches beneath the central tower surprises us. They cannot be less than 30 feet in height from floor to apex. The slenderness of the four octagonal piers which support the tower strikes modern architects with dismay, and fills them with admiration for the bold genius who safely erected such a tower upon such piers. The heraldic devices in the west window threw some light upon the enlargement of the church. On the north (or right hand) side of that window is the heraldic coat of the Burghersh family (ancestors of Lady Le Despencer). That family possessed the manor during the reigns of Edward I., II., III., and Bartholomew Lord Burghersh sold it towards the end of the reign of Edward III., somewhere about 1368.

At the evening meeting, papers were read by Mr. Furley on "The Early History of Ashford," by the Rev. Canon Jenkins on "The Connection of Heraldry with Architecture and Art," and by Mr. Loftus Brock on "The Characteristics of Kentish Churches."

The second day's proceedings began with a visit to the parish church of Ashford. The Rev. A. J. Pearman said that the building was a striking object, whether viewed from within or without. Externally, its situation on rising ground, and its lofty tower, rendered it a conspicuous feature in the landscape; while internally its size, with the number and massiveness of its columns, placed it in the foremost rank among the sacred edifices of the county. No one who took his stand at the font, and then slowly advanced up the central space towards the chancel, could fail to be impressed by the prospect before him as arch after arch came gradually into view. The church is dedicated to the Blessed Virgin, whose figure may be seen in a niche on the exterior, under the great east window. It is cruciform, consisting of a nave with north and south aisles, transepts, and three chancels, surmounted at the point of intersection by a steeple, in which are a clock, eight bells, and a set of musical chimes. The building will accommodate 1,700 worshippers. Domesday Book records that there was at that time at "Essetisford" a church and a priest. Of that fabric nothing remains. Probably in the reign of Henry III. (1216-72) the existing church was erected. There was evidently a great deal of reconstruction either in the fourteenth or earlier part of the fifteenth century. Accidents were continually occurring to churches in the middle ages, and it is not at all unlikely that a fire was the cause of damage in this case. About 1475 the church assumed the appearance which substantially it now presents. Sir John Fogge, of Ripton, as the inscription on

his tomb testifies, "renovated it at his own cost," "as well as the bell tower, which he built from the foundation." There are several interesting works in the church. Among these is a brass in the high chancel, which Weever says "presenteth the greatest glory and antiquity to this church." It is a memorial of the Countess of Athol who died in 1375. The tomb of Sir John Fogge is handsome, but the brass effigies of himself and his two wives have long been removed. His tilting helmet is hung in the Repton Chapel, and weighs about 24 lbs. The rood-staircase still remains in the south transept. During the Great Rebellion the old altar was pulled down by the then churchwardens, who were so proud of their exploit that they caused their names, "Joy Star," and "Wm. Wasley," to be cut in stone and let into the east wall as a memorial. This remained until the year 1695, when the stone was taken down and the inscription picked out with indignation by Mr. Marsh, an attorney of the town, with others; but a portion of it, with some of the letters quite legible, lay just outside the chancel door until quite recently. Of the old stained glass, which once abounded in the church, the last fragments were in the great west window, taken down in 1861.

Eastwell Church was described by the Rev. G. E. Gwynne. It was probably erected in the fourteenth century. It has two equal aisles, with a tower at the west end of the north. The church was restored some years ago, but too soon, according to Sir Stephen Glynne, to be entirely satisfactory. On the north of the church is a sepulchral arch, under which is an ancient tomb, supposed to contain the remains of the last of the Plantagenets. Tradition relates that he was the natural son of Richard III., who fled after the battle of Bosworth, August 23, 1485, and eventually came down to Eastwell, and worked as a bricklayer under Sir Thomas Moyle, who permitted him to erect a cottage near the mansion, where he lived for about four years before his death. This statement they would find partly confirmed by an entry in the parish register of burials, commencing in the year 1538: "Anno Domini, 1550: Rychard Plantagenet was buried ye xii. daye of Decembre Anno di Supra." There is a well still called after Plantagenet, and an ancient-looking cottage called "Plantagenet House."

Westwell Church, which is now being restored, was described by Canon Scott-Robertson. The walls he believed to belong to the Early English period. The windows, a piscina, and sedilia were added in the fourteenth century, but it was no larger now than it was in 1298, when Archbishop Winchelsea held an ordination in it. At that time the walls were probably rich in colouring, and traces of mural painting may still be discerned. The general effect achieved by the Early English architect of this church is gracefulness and lightness, and the efforts he made to obtain those objects, combined by a groined chancel roof, betrayed the genius of a master. Mr. Loftus Brock said that although the church was Early English, the tower was of an older date.

At Charing, a paper on the church was read by Mr. J. Sayer. The first mention of the edifice occurs in the taxation of Pope Nicholas, 1291, and, subsequently, the parish seems to have been rather over-furnished with churches, for the Lambeth registers show presentations to the church of Pette, to the chantry chapel at Burleigh, and the Norman chapel at Newland. Mr. Sayer succinctly went through the architecture of the edifice, and especially drew attention to the tower, with its singularly well-proportioned arch opening into the nave. For the fine roof of distinctive Elizabethan character they were indebted to the great fire which happened in the year 1590, and of which the following note was made at the time by Mr. Sayer's ancestor, Robert Honywood, of Pett. "Memo.—The parish church of Charing was burnt upon Tuesday, the 4th of Aug. 1590, and the bells in the steeple melted with the extremity of the fire; nothing of the church was left but the bare walls except the floor over the porch and the floor over the turret, where the weathercock doth stand. The fire chanced by means of a birding piece discharged by one Mr. Dios, which fired in the shingels, the day being extreme hot, and the shingels very hot, and the same shingels very dry." Weever states that the "birding piece" was discharged at a pigeon. Bishop Tufnell, under whose auspices the church was restored a few years ago, gave a tuneful peal of bells for the tower, previous to which there had been only one bell, a circumstance which gave rise to the distich, "Dirty Charing lies in a hole, it has but one bell, and that was stole." A bit of evil speaking, Mr. Sayer said, not even founded on fact, as the one bell was, no doubt, cast out of the material of the four bells melted by the fire, and Charing lies on the slope of the Chart hills.

Mr. Sayer afterwards described the Archbishop's palace and manor-house.

Little Chart, the Norman chapel at Newland, and Little Chart church with its Darell aisle, filled with numerous and beautiful monuments, were also visited. Next Canon Scott-Robertson described the Early English church of St. Nicholas at Pluckley, with another old family chancel, that of the Derings, and the handsome Tudor and Jacobean screens.

**A Benefactor** of the Wigan Infirmary has offered to erect and furnish a wing at a cost of 3,000*l.* in connection with the present buildings.

## THE NOTTINGHAM MUNICIPAL BUILDINGS COMPETITION.

**T**HE Public Offices Committee have presented the following report to the Town Council: The Public Offices Committee report that in pursuance of resolutions passed on July 13, 1882, they proceeded to take such steps as appeared desirable to enable them to obtain the most appropriate designs for the new offices required for the public business of the town. Your committee in the first instance decided to have two competitions, the first to be confined to general plan and organisation, the second to be open only to those who succeeded in getting a place in the first competition; but such second competition to be for the building complete. Your committee resolved that no premiums should be given to the successful competitors under the first competition; but that in the second competition the architect whose designs should appear to the Corporation to be in all respects the best should be awarded and paid a premium of 300*l.*; that the architect whose designs were selected as second best should be paid a premium of 200*l.*; and that the architect whose designs should be selected as third best should receive a premium of 100*l.* It was also arranged that the premium should merge in the commission of the author of the premiated design who should be employed to carry out the work. It was made a condition of the competition that the premiated designs should become and remain the property of the Corporation. Your committee reserved to themselves the right to employ quantitative surveyors or assessors to determine whether the probable costs of the building would exceed that which the competitors gave in their estimates. All designs were to be sent in under motto; not more than eight designs were to be selected under the first competition; and those who were successful in obtaining a place therein were to be invited to enter upon the second competition. In the second competition an architect was to be appointed from three architects of standing and eminence to be named by the Corporation, and the report of such referee architect was to be submitted to your committee. Your committee endeavoured to impress upon the competitors that the intention of the Corporation was not to build a town-hall, but business premises, in which convenience of arrangement would take precedence of architectural effect, and that economy would be a primary consideration. Your committee then proceeded to obtain from the principal officials in each department, mentioned in their report of July 13, 1882, a statement of the number and size of the rooms required for the efficient but economical working of their departments. Your committee next instructed Mr. M. Ogle Tarbotton, the Consulting Engineer to the Corporation, to prepare a specification for the guidance of architects who intended to send in competitive designs. In pursuance of such instructions, Mr. Tarbotton drew up an admirable and very clear statement by way of "Instructions to Architects." For the information of the town council a copy thereof is printed in the appendix to this report. Your committee do not hold themselves bound by the statement of the approximate areas which are there mentioned to be required for each department; but on a review of the total requirements of the various departments necessarily concentrated in the new municipal buildings, and in view also of the rapid development of the town, your committee are of opinion that the total area is not excessive, and perhaps not more than a fair provision for the future. Your committee then advertised for competition drawings, and directed them to be delivered to the Town Clerk by the middle of March last. In response to the advertisement 117 designs were sent in. They were hung in the Exchange Buildings. They were most carefully inspected by your committee, and very great pains were taken to arrive at the selection of the eight designs for the second competition. After careful consideration your committee were of opinion that, considering the terms of the competition, and the objects of the council, the following were the eight that should be thus selected: "Childe Harold," "Esto," "J'espère," "Light," "Might, Light, and Right," "Order," "Simplex," "Suitability." The envelopes containing the names of the authors were opened, and were found to be "Childe Harold," F. H. Oldham, 23 John Dalton Street, Manchester; "Esto," J. W. Hickson, 6 Exchange Street, Manchester; "J'espère," Messrs. Truman & Pratt, Nottingham; "Light," G. Corson, 35 Cookridge Street, Leeds; "Might, Light, and Right," Messrs. Verity & Hunt, 27 Regent Street, London; "Order," Y. Thomason, Bennett's Hill, Birmingham; "Simplex," W. Harvey, 7 Whitehall Place, London; "Suitability," C. Bell, 9 New Broad Street, London. Your committee, therefore, invited these gentlemen to send in final designs for the building, under the terms of the second competition. Seven sets only were sent in under the new mottoes "Esperance," "Fiat," "Queen Bess," "Sepia," "Speedwell," "Strive to Thrive," "Wisdom, Strength, and Beauty." In pursuance of the terms of the competition, your committee named the following three architects, one of whom was to be selected by the architects themselves, as the final judge of the merits of the competitive drawings: Mr. Charles Barry, Westminster Chambers, Victoria Street, London; Mr. Henry Currey, 37 Norfolk Street, Strand, London; Mr. Alfred Waterhouse, 20 New Cavendish Street, Portland Place, London. A meeting was held in London,

when a majority of the competitors selected Mr. Alfred Waterhouse. The second set of drawings were delivered on June 30, and Mr. Waterhouse proceeded at once to make a most thorough and exhaustive examination of them. By his award he has bracketed two of the designs, namely, those under the motto of "Wisdom, Strength, and Beauty," and "Queen Bess," for first place, putting "Sepia" in third place. The report of Mr. Waterhouse will be found in the appendix. From that report it will be seen that "Wisdom, Strength, and Beauty" was selected for its admirable plan and its economical advantages, whilst "Queen Bess" was selected mainly for the general beauty of its external design. Your committee opened the envelopes containing the names and addresses of the competitors in the second competition, when it was found that the three successful competitors were "Wisdom, Strength, and Beauty," Messrs. Verity & Hunt; "Queen Bess," Mr. F. H. Oldham; "Sepia," Mr. G. Corson.

Your committee recommend the council to accept Mr. Waterhouse's report, and in view thereof to add together the first and second premiums, and divide them equally between those bracketed for the first place, awarding the third premium to the author of "Sepia." Your committee also recommend that in the event of the council ultimately deciding to carry out the designs of one of the authors bracketed for the first place, the premium he would then forfeit should be distributed among the four unsuccessful candidates in the last competition. The designs under each competition have been thrown open to the council and the public, and special facilities have been given to the press to comment thereon. Your committee believe that the method in which the competition has been conducted has given general satisfaction. It has met with the commendation of all the leading professional publications. Your committee beg to state that the competition has been most successful, and the council have now two, if not three, sets of drawings of an admirable character, in which all the requirements of the competition have been observed.

Your committee, however, are bound according to the terms of the resolution of the council to present their own report with the report of the adjudicator. They have no hesitation in recommending the council to select the design of "Wisdom, Strength, and Beauty" (sent in by Messrs. Verity & Hunt) as best adapted for the purposes the council have in view. They are architects of well-known reputation, and have erected some large buildings in London and the provinces, and can be thoroughly relied upon to carry out their work with strict integrity. No doubt the design "Queen Bess" is one of great merit, but your committee doubt how far it would be applicable in many of its details to pure business premises. Moreover, it will be seen that the quantitative surveyors report that the cost of the work will probably exceed that of Messrs. Verity & Hunt by a considerable sum. Your committee are further of opinion that the elevation of the design submitted by Messrs. Verity & Hunt is better adapted to the purposes for which the building is to be used. Your committee, therefore, do not hesitate to recommend the council to adopt the designs under the motto of "Wisdom, Strength, and Beauty." In this opinion your committee are confirmed by the leading professional journals of the day. Your committee, therefore, lay these facts before the town council, with their advice thereon, and await the further instructions of the council. Your committee, however, were further requested to advise on the estimated cost of the proposed building. They are of opinion that the estimate of Messrs. Verity & Hunt of 128,416*l.* may be taken as a fair basis for a calculation, and if to that amount is added 10 per cent. for estimate and contingencies, the total amount will be 141,257*l.* The lighting of the building and the furnishing thereof, in addition to that which can be removed from existing offices, will probably cost not more than 20,000*l.*, making the total estimated outlay 161,257*l.* To meet this outlay the council can dispose of the following buildings and premises: The Town Hall, Weekday Cross; the Municipal Offices, Albert Street; the Gas Offices, George Street; and the Water Offices, St. Peter's Gate. Your committee have had these valued by Mr. Tarbotton, the consulting engineer, and Mr. Brown, the borough engineer, and they report that in their opinion the above property is worth 70,000*l.* To this sum must be added the proceeds of the sale of the Police Station and adjoining properties to the Government, amounting to 12,000*l.* The council should also bear in mind that there is a surplus revenue on the administration of justice of between 2,000*l.* and 3,000*l.* per annum. The accommodation for the gas, over and above that derived from its present offices, and by which it will benefit (including new store rooms, workshops, show-rooms, &c.), may be valued at 20,000*l.* These items together make a total of 102,000*l.*, showing a deficiency of 59,257*l.* Your committee desire to call the attention of the council to the fact that the council are authorised by the Nottingham Improvement Act, 1874, to dispose of the corporate estates for purposes of erecting public offices and buildings. Your committee believe that several portions of such estates are at present in situations that will not be likely to be of any value for town improvements, and that they are producing no adequate return. Your committee suggest that such portions of the estates should be sold, and the proceeds appropriated to meet the contemplated deficiency in the expenditure on the new public offices. Your committee ask the

council to take all these circumstances into consideration. They advise (1) that the proceedings of your committee in obtaining the designs and awarding premiums should be approved; (2) that the Estates Committee should make inquiries into the propriety of parting with any portion of the estates for the purpose of using the proceeds for the erection of public offices; and (3) that the further consideration of your committee's report should stand adjourned until it is ascertained what portion of the estates can be fairly available for the purposes of covering the deficiency in the costs of the erection of the proposed new buildings.

At the meeting on Tuesday, the recommendation of the committee as to the distribution of the premiums was adopted. The further consideration of the subject was adjourned.

### THE PRINT ROOM, BRITISH MUSEUM.

A LETTER has been published from Mr. Seymour Haden on the proposed removal of some drawings from the Print Room. He says: On the plea that the painter's drawing is part of his picture, and that the two should be studied together, it has been proposed, or rather the proposal has been revived, to separate the old master drawings now associated with the prints in the British Museum, and to add them to the paintings in the National Gallery. Such a plea, preferred by an able and spirited director, intent on making the collection under his charge as complete an exposition of the painter's art as possible, cannot fail to command attention, and, it may be, to obtain a certain measure of assent; and yet it is not, I would submit, a plea which will bear examination, or which the trustees of the British Museum could accept as a warrant for the dismemberment of the collections of which they are the legal guardians. Those collections, ranging as they do from the rude contrivances of a prehistoric age, to the latest developments of human genius and resource, represent, with the printed books and manuscripts, of which, in fact, they are the illustrations, a comprehensive history of the arts of civilisation. But painting is only one of those arts. Engraving, original engraving that is, occupies a large place in that history, and, with sculpture and architecture, covers the greater portion of the ground. To each of these, in varying proportions, and sometimes to all of them together, the drawings in the British Museum, directly or indirectly, refer; the early German and Italian drawings chiefly to engraving; what may be called the *dessins raisonnés* of Leonardo and of Dürer to the arts of proportion and construction; the designs of Michael Angelo and of Flaxman to sculpture and the plastic arts. Nor is the connection less intimate between these eight or nine thousand Museum drawings and the large section of engraved historical portraiture, costume, habits, and customs, illumination, ornamentation, topography, and even caricature. Does the National Gallery propose to take the whole of them? If not, on what principle would it make a selection of them?

I have said that the early Italian and German drawings refer chiefly to engraving; I might have said almost exclusively, since the engravers and draughtsmen of that time had the field of art pretty much to themselves; while it is not the less a fact that those of them who are known to have been also painters—Mantegna, Mocetto, the Campagnolas, Schongauer, Dürer, and Lucas of Leyden—influenced the history and future of art greatly more by their drawings and prints than they did by their pictures. To take them out of their natural category, therefore, and for the sake of illustrating a single branch of art, however important, to dislocate the current facts of history, would, I submit, be both arbitrary and unphilosophical.

Suppose, however, the proposed divorce accomplished, and it were desired to ascertain the extent to which these master engravers had prepared themselves by drawings previously made for the composition and execution of their plates, is the student to examine the print, Dürer's *Adam and Eve* say, in one place, and the drawings which suggested it in another; the pen-and-ink studies of the arm of Eve and the leg of Adam in the National Gallery, and the torso of the latter again, since that portion of the print happens to have been copied (the modern engraver would say "translated") from another engraving in the British Museum? A species of torture is implied in this kind of study which I feel sure can no more have suggested itself to the promoters of the new scheme than it did to the authorities in Paris, when, for want of room, they left another of this master's prints—*The Great Fortune*—in the Bibliothèque, and carried off her wings to the Louvre!

Referring, again, to a later period, what clue should we have to the engraved art of Marc Antonio without the drawings of Raphael, which furnished the motives for his plates, or, to a later period still, to the strong personality of the etchings of the Dutch and Flemish schools, without the drawings of Rembrandt and of Ostade, of which they are reflections.

On the whole, therefore, I would submit that the plea for a separation of these historical collections has not been made out; and, moreover, that every purpose sought to be obtained by such separation might be better attained by a simpler proceeding—namely, by the acquisition by the National Gallery of as complete a collection as possible of autotype reproductions of old master

drawings, not only from the British Museum, but from other museums of Europe, and by the exhibition of at least as many of these as might be found to refer to the pictures actually in the gallery. I am under the impression that, for all purposes of study, and for the handling and exposure which such study supposes, such a collection would be found much more useful, and as a possession far less embarrassing, than the few precious originals which it has been sought to obtain for the purpose.

It is also, I should think, scarcely to be doubted that the advantage of an international exchange of this sort would equally recommend itself to Continental galleries.

## ARCHÆOLOGICAL AND TOPOGRAPHICAL BOOKS.

THE library of the late Sir Richard Colt Hoare was sold last week by Messrs. Sotheby, Wilkinson & Hodge. It consisted of several thousand volumes, including a collection of county histories and British topography, with numerous prints of portraits and views, many water-colour drawings, and works illustrating the favourite subject to which Sir Richard Colt Hoare devoted himself for many years. The sale realised 10,028*l.* 6*s.* 6*d.* Some of the books brought very high prices, as will be seen from the following list:—

Ashmole's Berkshire, 1719, 3 vols.—34*l.* 10*s.*; an extensive collection of topographical tracts relating to every county in England and Wales, in 73 vols.—34*l.* 10*s.*; "Annalia Dubrensis: upon the Yeerely Celebration of Mr. Robert Dover's Olympick Games upon Cotswold Hills," 1636, with the rare frontispiece and manuscript notes by Sir R. C. Hoare—16*l.*; Atkyns (Sir R.), Ancient and present state of Gloucestershire, 1712—38*l.*; Barnes (J.), Treatises of hawking, hunting, coat armour, fishing and Blasing of Arms, blackletter reprint of Wynkyn de Worde, with introduction by J. Haslewood, 1810—9*l.*; Blomefield's History of Norfolk, continuations by Rev. C. Parkin, 5 vols., 1739—75—90*l.*; Buckler's Ecclesiastical Antiquities of Wiltshire, Salisbury, &c., a collection of 690 water-colour drawings, made for Sir R. C. Hoare in 1808—9—10 by John Buckler—465*l.* Several similar collections by the same artist, but smaller in number, illustrating ecclesiastical and baronial and various other antiquities in England and Wales, were sold at prices varying from 10*l.* to 26*l.* 10*s.* Burton's "Monasticon Eboracense," York, 1758—11*l.*; Chronicles of England, Scotland, Ireland, France, &c., by Arnold, Fabian, Froissart, &c., edited by Dibdin, Douce, Sir H. Ellis, &c., 21 vols.—31*l.* 10*s.*; Civil War Tracts, arranged by the counties they refer to, 1641, &c., 21 vols.—46*l.* 10*s.*; Collinson's Somersetshire, 3 vols., Bath, 1791, large paper copy—53*l.*; the same on smaller paper—12*l.*; Dallaway's Sussex, Rape of Chichester, 1815, Rape of Arundel, 1819, Rape of Bramber, by E. Cartwright, 1830, 3 vols.—44*l.*; Capgrave, Nova Legenda Angliæ, black letter woodcuts, Wynkyn de Worde, 1516, several leaves mended, and the suppressed Life of St. Thomas à Becket, supplied from a shorter copy, sold not subject to collation for 12*l.*; Carter's Ecclesiastical and Monumental Antiquities of South Wales, 1803, 4 vols., with 208 drawings in sepia—161*l.*; Coningsby (Thomas, Earl of), Account of the Manor of Marden, Herefordshire, 1813, privately printed by the Earl of Coningsby, never published, and nearly all copies destroyed by the earl when he failed to get possession of the estates he claimed—80*l.*; Cope (W.), Tour in Monmouthshire, 1801, largest paper, printed for Sir R. C. Hoare and illustrated with 96 drawings in sepia by him, but it has not the map and other engravings from these drawings, a unique copy—200*l.*; Crocker (P.), 52 Drawings in Water-colours of Vases, Celts, and other Antiquities, engraved in Sir R. C. Hoare's "Ancient Wiltshire"—171*l.*; Croniques de Normandie, black letter, Rouen, no date—39*l.*; Hardyng (J.), Chronicle in verse, with continuation in prose by R. Grafton, black letter, by R. Grafton, 1543, fine copy, bound by Roger Payne—24*l.* 10*s.*; Dugdale's Warwickshire, augmented by W. Thomas, 1730—41*l.* 10*s.*; Enderbie, Cambria Triumphans, or Brittain in its Perfect Lustre, original edition, 1661—16*l.* 10*s.*; Fabian's Chronicle, black letter, 1559—19*l.*; Froyssart's Cronycles, black letter, 1535, W. Myddylton and R. Pynson, a few leaves mended, otherwise a fine large copy—41*l.* (Sir W. Tite's copy brought 70*l.*, and Sir M. Sykes's 42*l.*); collections of water-colour drawings and sketch-books of Sir R. C. Hoare, illustrating itineraries, sold at from 20*l.* to 48*l.* a volume, and one set of 144 in sepia, views in Wales for Giraldus' Itinerary, Stourhead, 1814, sold for 75*l.*; Hodgson's Northumberland, Newcastle, 1827—35, 7 vols.—51*l.*; Horæ B. V. Mariæ ad Legitimum Eboracensis Ecclesiæ Ritum, woodcuts, 1517, Rothomagi, G. Bernard et J. Cousin, one of the very rare York Service books—200*l.*; Hasted's History of Kent, Canterbury, 1778—99, 4 vols., 37*l.*; Higden (R.), Polycronicon, Englyshed by John de Trevisa, Ycarye of Barkleye at requeste of Syr Thomas Lorde Barkley, with continuation (1357 to 1460) by W. Caxton, black letter, woodcuts, Southwerke, by my Peter Treueris, 1527 (this copy, considered to be the *chef-d'œuvre* of the press of P. Treveris, formerly belonged to Thomas Brooke, who was executed in Norwich, August 30, 1570, and whose autograph and MS. notes

it bears)—47*l.*; Hoare (Sir R. C.), Modern History of Wiltshire, 6 vols., additionally illustrated with water-colour drawings by Buckler and others, 1822—43—200*l.*; three other copies without these drawings sold at 30*l.*, 32*l.*, and 54*l.*; Hoare's Hungerfordiana, Memoirs of the Family of Hungerford, Stourhead, 1823, with 34 drawings by Buckler—105*l.*; Hoare's Monastic Remains at Witham, Bruton, and Stavordale, Somerset, Frome, 1824—44*l.*; Views in North Wales, with tour, and MS., with drawings, by Sir R. C. Hoare—48*l.*; a similar collection with MS., 1793—1808—51*l.*; Views in Naples, drawings in sepia by Sir R. C. Hoare—54*l.* 12*s.*; Views in Sicily, with MS. and drawings by the same—63*l.*; Morant's History of Essex, 1768—44*l.*; Nichol's History and Antiquities of County of Leicester, 1795—1811, large paper, 4 vols.—230*l.*; Shaw's Staffordshire, 4 vols., large paper, 1798—1801—62*l.*

## THE ASHBURNHAM MANUSCRIPTS.

A PARLIAMENTARY paper has been published containing the correspondence which has passed this year between the British Museum and the Treasury with reference to the purchase of the Ashburnham MSS. The published papers include the original recommendation by the trustees of the Museum that the whole collection should be purchased for 160,000*l.*, the refusal of the Government, the recommendation that the Stowe Collection and the Appendix should be purchased for 90,000*l.*, the proposal by the Government to give 70,000*l.*, the offer of the Museum to make good the difference between the two prices, and the final agreement of the Government to purchase the Stowe Collection for 45,000*l.* With regard to the disposal of the collection, a Treasury minute, dated July 16, 1883, states that the Lords Commissioners of the Treasury have been in communication with the Lord-Lieutenant of Ireland and with the Chief Secretary on the two questions which remain for settlement—viz. (1) which of the manuscripts should be sent to Ireland, and (2) at what place those so sent should be deposited. The minute continues: "Upon the former point my lords observe that the selection is practically confined to the two sections of the collection in which are contained respectively the manuscripts in the Irish language, and those bearing more or less directly upon Irish history and literature. But the decision within these limits depends upon various considerations, which can only be decided by experts. The importance of making one national collection as complete as possible must be practically reconciled with the advisability of depositing a special class of documents in a place which either is or ought to be most convenient to their special students; and local feelings must be weighed against the interests of science. My lords will indicate at the end of this minute the means whereby they propose to solve this difficulty. As regards the place of deposit, it appears clear that with the possible exception of some documents of the nature of 'Public Records,' whatever part of the collection is sent to Ireland should be kept together, and not scattered; it must therefore be deposited in Dublin. After giving full consideration to the claims of the various places in that city where it has been thought the manuscripts might be preserved, Her Majesty's Government have come to the conclusion that the Royal Irish Academy best fulfils the necessary conditions. That institution has maintained a high reputation as a learned body, and is already the possessor of valuable collections illustrative of the history and antiquities of Ireland—collections which are and will be available for the use of students and the public. A difficulty, however, arises from the fact that although the Irish Academy is in many ways connected with the State, notably as receiving a large annual grant, it is not under direct Government control. To meet this it is proposed not to give the manuscripts to the Irish Academy, but to lend them to it indefinitely, upon the sole condition that they remain available for the use of students and the public upon terms to be agreed on; the manuscripts remaining the property of the Treasury. The terms of the loan to the Irish Academy, and the selection of the manuscripts to be so lent, should be settled in the first instance by a representative of the British Museum in conference with some gentleman from Ireland. For this purpose my lords consider that no person would be so appropriate as Sir Samuel Ferguson, who, as president of the Royal Irish Academy as well as deputy keeper of the public records of Ireland, seems marked out for the duty of giving advice in this matter. The ultimate decision and responsibility must, however, rest with the Government." An appendix contains a catalogue of the manuscripts in the Stowe Collection, with descriptive memorandum by Mr. R. B. Knowles.

The New Portion of the University of Indiana was, on the night of July 12, set on fire by lightning, which travelled along a telephone wire in the institution. The laboratory, museum, and library were completely destroyed. There were 15,000 volumes in the library, besides the so-called Owen collection, the loss of which is believed to be irreparable. The general loss is estimated at 200,000 dols., of which only 30,000 dols. is covered by insurance.

### THE MANCHESTER ART GALLERY.

THE structural alterations in progress at the Royal Institution, in order to adapt the building for the purposes of the new Corporation Art Gallery, are now completed, and, according to the *Manchester Guardian*, the result, so far as can at present be judged, is most satisfactory. The fundamental change is the removal of the old lecture theatre, which occupied the centre of the building and extended through its entire height. Formerly the floor of the theatre was raised above the level of the rest of the ground-floor. The floor level has now been made the same as that of the other rooms of the ground-floor. At the same time the galleries of the upper floor, which were divided into two parts by the lecture theatre, have now been made continuous. The ground-floor rooms on either side of the lecture theatre were formerly broken up by a number of partitions. All these have been removed, and the rooms on this floor now correspond with those on the floor above. Two fine continuous suites of rooms have thus been obtained on either floor. The only drawback from the change is that the back rooms on the ground-floor are rather dark. A magnificent new gallery has, however, been secured on the first floor, which will be better lighted than any of the rooms formerly used for the display of pictures. We understand that it is intended to appropriate the first floor, as in former years, to the autumn exhibition of pictures, which will be opened on the 31st of this month. The objects recently acquired as the nucleus of the permanent art collections will be displayed on the ground-floor. They will include the extremely interesting and valuable "Bock" collection of ancient textiles, which will occupy the whole of one of the long side galleries, a collection of Indian textile fabrics from the South Kensington Museum, and a loan collection of pottery from South Kensington illustrating the growth of the potter's art in various countries. A number of beautiful autotypes and engravings of drawings and paintings by the old masters, which have been purchased by or presented to the Art Gallery Committee, will be displayed in the other side gallery, while the rooms at the back will be devoted to casts of sculpture. The structural alterations have been most efficiently carried out under the direction of Mr. Allison, city surveyor.

### THE WELLINGTON MONUMENT IN ST. PAUL'S CATHEDRAL.

IT was again stated in the course of the correspondence respecting the Wellington Monument, that the late Dean Milman not only failed to appreciate Stevens's design, but actually ridiculed it. The Rev. W. H. Milman now asserts that there is no real foundation whatever for this assertion. "Dean Milman," he says, "had a high admiration for Mr. Stevens's design, and accorded to it his warmest praise. It is true that in common with many others he entertained some doubt as to the propriety, from an artistic point of view, of including in one monument two effigies of the same person, one representing him in the calm of death, the other in all the activity of life, and he expressed this doubt in the humorous way habitual to him. 'The design was all he could wish it, if only the duke would not ride into the cathedral upon the top of his own monument.' Solemn people with no sense of humour always fail to see the real scope of remarks like these, which, however telling, often express a passing impression rather than a mature judgment. Dean Milman had no wish that the monument should remain as it remains at present, incomplete. I have no doubt whatever but that he would have preferred to see the equestrian statue of the duke crowning the work, if no more appropriate single figure or group could be designed, rather than that it should continue in its unsatisfactory incompleteness.

"As to the proper place for the monument, however, Dean Milman entertained no doubt. As the custodian of a building of sublime proportions, distinguished for the perfect harmony of all its parts, he felt that it would be wrong to destroy the symmetry of the nave arcades by introducing beneath one of the arches a vast monumental structure, however indisputable the merits of such structure might be. He felt a scruple too, as he has often told me, taking into consideration the uses to which the cathedral might at any time be put, as the proper place for all solemn acts of national worship and the ever-increasing demands made for the accommodation of large congregations, at the idea of trenching upon the space which Sir Christopher Wren had left free, by the erection of any permanent structures upon any part of it. He felt, too, that if one archway of the nave were given up to a Wellington monument it would hereafter be more difficult to defend the remaining similar spaces from similar and less warranted intrusions. Hence his persistent and successful advocacy of the Consistory Court as the only unobjectionable place in the cathedral for a monument of the dimensions of that of the Duke of Wellington. I will venture to ask, after all, was not Dean Milman right in his decision? The Consistory Court may not be an ideal place for a monument, but ought a unique building like St. Paul's

to be sacrificed to the monument, however high its artistic merit, of one man, however great?

"If I may venture to add a word of my own upon the present controversy, I would suggest that if—in addition to the already advocated removal of the screen which, whatever may be its artistic merit, has lost all meaning, and as the former Consistory Court is no longer appropriated to the uses for which it was designed—the strong light which flows in from the great south window were tempered without being too much obscured, Mr. Stevens's fine monument of the great hero would be seen to the full as well where it is as it would be on the spot to which it is proposed to remove it."

### THE FORTH BRIDGE.

AMONG the provisions contained in the Forth Bridge Railway Act, 1882, is one for a quarterly inspection by officers of the Board of Trade of the works in progress for the construction of the bridge over the River Forth at Queensferry. The first inspection was lately made by Major-General Hutchinson, R.E., and Major Marindin. According to their report the principal part of the undertaking which has, up to the present date, been completed, is in connection with the temporary works necessary to insure that the actual construction of the bridge and the viaducts leading to it shall be properly carried out, which works are of very considerable importance.

At South Queensferry there has been enclosed an area of about 20 acres of ground, upon which have been erected large offices for the engineering staff; sheds for workshops, having an area of 9,734 square yards, now ready for the reception of the machinery, of which a large quantity has been ordered, and some is being delivered; four parallel foundations each 400 feet in length, upon which the large tubes are to be built up, with lines of railway between them to carry powerful cranes and drilling machines; gas furnaces, engines, and accumulator for providing hydraulic power, cement stores, testing-house, general stores, &c. A temporary wooden stage is also being run out from the south side to give facilities for the erection of the viaduct girders, and for the conveyance of the steel work for the south cantilever to the site at the centre of the Firth. This stage is immediately to the east of the viaduct, and will be about 1,900 feet in length, of which length about 500 feet are completed. At Inch Garvie, a rocky island, upon the base of which the great central pier will rest, a landing-stage, 320 feet in length, with wrought-iron piers and girders, is being constructed, and about 160 feet are nearly completed ready for the platform. At North Queensferry, on the Fife shore, two landing-stages or quays have been constructed, and some workshops and a number of cottages are in progress.

The permanent works which have been completed are as follows:—

At South Queensferry the foundation for viaduct pier, No. 1, which is on hard boulder clay, has been excavated, and is being concreted, and the foundations for viaduct piers, Nos. 2, 3 and 4, which are on a hard freestone rock, have been levelled and prepared for the concrete. At Inch Garvie, the only permanent work which has been done consists in the cutting away of the rock in preparation for the commencement of the piers. At North Queensferry the foundation for the cylinder at the north-west angle of the Fife pier has been cut out in the rock to the full depth, and is ready for concreting, and the cutting out of the rock for the foundations of the other three cylinders in this pier is in progress; although but little has as yet been done upon them; the foundation for the cantilever pier has been excavated to the full depth, and is being concreted; those for viaduct piers, Nos. 12 and 13, are completed, and the excavation for that of viaduct pier No. 11 is well forward. All these foundations are on whinstone rock, and the cantilever and viaduct piers are to be faced with granite, of which a large quantity is stated to be ready dressed, and some is delivered. The engineers state that the steel plates first required for the large tubes are being rolled at Messrs. Siemens' works at Landore, that the first of the Queensferry main pier caissons on the pneumatic system is in course of construction at the works of Messrs. Arrol, at Edinburgh, and that the viaduct girders have been ordered.

The engineers have furnished diagrams of the strains upon the piers and other parts of the bridge, showing that, according to the result of their calculations, under no possible combination of a 56 lbs. wind blowing in any direction, and a rolling load of 3,400 tons on the span (i.e. two tons to the foot), will the stress either in tension or compression exceed one-fourth of the ultimate resistance of the steel to be used in the construction of the bridge, viz., 30 tons per square inch in tension, and 34 tons in compression. The specifications provide for the testing of the steel being conducted in the manner prescribed by the Admiralty regulations, and the specimens of steel and the results of the tests show that the requirements of the Board of Trade have been more than complied with.

In conclusion the inspectors report that the preparations which have been made, and the machinery and plant which have been ordered, indicate that it is the intention of the engineers and the

contractors to carry out the works in a manner suitable to the magnitude of the undertaking, and that, so far, these works have been completed in accordance with the authorised plans, and in a satisfactory manner.

### BOROUGH ENGLISH.

A CASE which was heard at the last Gloucestershire Assizes is suggestive of the connection between archæology and law. It has been recognised that among the unwritten laws of England are particular customs which affect only the inhabitants of certain districts. "These particular customs, or some of them," says Blackstone, "are without doubt the remains of that multitude of local customs out of which the common law, as it now stands, was collected, at first by King Alfred, and afterwards by King Edgar and Edward the Confessor, each district mutually sacrificing some of its own special usages, in order that the whole kingdom might enjoy the benefit of one uniform and universal system of laws. But for reasons that have been now long forgotten, particular counties, cities, towns, manors, and lordships were very early indulged with the privilege of abiding by their own customs in contradistinction to the rest of the nation at large, which privilege is confirmed to them by several Acts of Parliament." One of those customs is called Borough English, and through it the youngest son inherits the estate in preference to all his elder brothers. In order to apply the principle it is necessary that the estate should be within the boundary of the ancient borough in which the custom was observed, and in the case that was heard at Gloucester it was agreed between counsel that the only question, except that of mesne profits, was whether the custom of Borough English prevailed in the ancient city of Gloucester, and whether the premises in question were within the area to which such custom applied.

The plaintiff in the case was the heir by the common law—being the eldest son of the deceased eldest son of the owner of the property. But on the death of the owner, his youngest son (who was the uncle of the plaintiff) entered into possession of the premises.

Mr. Powell, Q.C., was counsel for the defendant, and in his address he said there could be no doubt that the custom of Borough English prevailed in Gloucester, which was one of the most ancient cities in the kingdom. The ancient Britons erected their huts upon its site, and it became one of the twenty-eight cities which were founded in England previous to the Roman invasion. The Romans made it a military station, and when they left England the Saxons occupied it as the capital of Mercia, and established in it their laws and customs, and as early as the eighth century, and consequently long before the Norman Conquest, which introduced the feudal system, as ancient chroniclers said, "it was one of the noblest cities in the kingdom." For upwards of a thousand years the Saxon custom of Borough English had prevailed in the city. It had survived the feudal system which prevailed in other parts of England, the intestine struggles of the Plantagenets, the iron rule of the Tudors, the lawlessness of the Stuarts, even the more ruthless hands of so-called law reformers. What the origin of the custom was is lost in the darkness of antiquity. Many explanations had been suggested, some learned and others foolish, some grave and others ribald, but that in Gloucester a man's youngest, and not his eldest son, was the heir-at-law he had never heard disputed until now; and the property in question being far within the city boundaries, was consequently subject to the custom of Borough English. The boundaries of the city were as well known, as carefully marked, and as often perambulated as those of any other locality in the kingdom. Not only stones existed to testify it, but from time immemorial, until a very recent period, those stones had been beaten and the bounds perambulated periodically for the express purpose of keeping up the memory of the city boundary. This could be proved by a hundred people who had seen it or heard it from their forefathers, and all would testify that the property in Hare Lane was far within the city boundary. By the statement of claim the property was described as a dwelling-house, "situate on the north side of the city wall of the city of Gloucester on the outer side of the said wall." It was known that the walls in Gloucester were built by the Romans, and they continued to occupy the same site or nearly so until Charles II. caused them to be demolished because they had withstood the memorable siege by his father, which led to the loss of his crown and life. But were the walls of the Roman station at Gloucester the boundaries of the city? The Romans left Britain about the middle of the fifth century, and the Saxons took possession of it afterwards. The Romans and their walls had nothing to do with the custom of Borough English. It was the Saxons who established that custom, which had prevailed ever since. Ancient maps existed which had always been received and acted upon as authoritative maps of the boundaries of the city. No doubt the boundaries had of late years been enlarged for political and municipal franchises, but it was not necessary to discuss whether this custom had been extended with those enlargements. Hare Lane had at all times been within the old boundary. In the conveyance of this very property from the Dean Forest Railway Company, it was described

as being within the city of Gloucester. But there were numerous instances in which property, even further outside the Roman walls than this property, had been dealt with, and admitted by those interested in proving the contrary to be within the boundary of the city. He could not give a better illustration of this than the Shire-hall. The old Roman wall in that part of the city passed through the site of a house a few doors above, crossed the Westgate Street, went along College Street, passed through the south porch of the cathedral, part of which porch was actually built upon it. Why, so far from this Shirehall being outside the city, it required an Act of Parliament in 1814 to declare that all proceedings taken within it at the county assizes should be held to have been transacted within the county. Could there be a more conclusive proof that the Roman walls were not the boundaries of the city? As to the policy of the custom of Borough English, of course they had nothing to do with it, but it could not be more impolitic—that was worse for people generally—than that a man's eldest son should have all his land if he died without a will. Those who did not like the custom could easily avoid it by making wills and leaving their lands to whom they pleased, but, as to the ancient custom which had so long prevailed, the citizens say, as was said of old, *Nolimus lege Angliæ mutare*.

After some witnesses had been examined respecting the custom, counsel for the plaintiff acknowledged that evidence was against his client, and judgment was accordingly entered for the defendant.

### CONTRACTORS' GRIEVANCES.

A LETTER from a contractor has appeared in the *Dundee Advertiser*, in which he writes: What we are most concerned about, and what we would protest against with all our might, is the painfully loose and absolute system of generalising which is only too manifest in the specifications of some engineers, instead of definiteness and precision in particulars which one would expect to find, and the attempt which is made too often successfully to fasten on the contractors the responsibility of the whole by the insertion of clauses which "secure" too well the contractor on all sides by leaving him at the mercy of the engineer, and making the will of the engineer absolute and supreme. Now, there can be no question that much of this is due to imperfect knowledge, and any one knows that has had much experience of contract work that a good deal of the looseness and carelessness in drawing up specifications would often result in serious differences between contractors and engineers but for the timeous saving clauses put in in the interests of the engineer by himself, and by the insertion of which he gains an exceptional and privileged domination. But in the hands of inexperienced men, or indeed of any man, this is a dangerous power, and ought not to be. No party who places his services and his capital at the sight and direction of another should be so conditioned, either by the necessities of the times, the exigencies of his calling, or the stipulations of another's will, as to be obliged to continue in the exercise of all these means and take the whole risks, and at the same time be denied redress against the dangers of incompetence or the presumptions of authority. It is cruel and selfish, and positively unfair to think so. Yet the cases are by no means infrequent. Common sense would decide that it is only the barest justice to give an open door for the free play of equity between man and man. All appearances to interfere with the free and unbiassed administration of just principles in public life and business should be carefully excluded, and those who are responsible for its interruption, or the possibility of interrupting it by partial or prepossessed fancies of their own, are guilty of sowing the seeds of distrust, and promoting consequences prejudicial to both parties concerned. It is a satisfaction to be noted that amongst the most eminent of our engineering profession a wider and more generous spirit of justice prevails in their dealing with business men. It can be to the credit of neither the individual nor the profession to assume a position calculated to reflect unjustly on the other. Engineers are not infallible, and their interests are not indifferent to themselves. It would be well if this was more generally recognised when they come to claim the right of arbitrating between themselves and their contractors. Why should an engineer be an arbiter in his own case any more than a contractor? Is it not enough that you bind the latter to a whole chain of conditions and restrictions, involving "inspections," "satisfactions," and responsibilities innumerable, even to the extent of "omissions," as well as commissions by the former, that you should seek to tie the contractor neck and heels to the will and fancy of his engineer? It is against this dangerous, one-sided, selfish principle we would wage perpetual war. At this moment about half a dozen cases are known to us where the obnoxious and iniquitous thing is rising up to threaten the interests of contractors by withholding an impartial inquiry into particulars. One was reported in your columns quite recently. It was raised at the instance of Mr. George Mackay, contractor, Broughty Ferry, against the Barry Local Authority, for payment of the sum of 1,248*l.* odd on account of extra and additional works ordered by their engineer, Mr. Alex. McCulloch, Dundee, during the execution of the Carnoustie water-

works. Some time before this a case appeared by Mr. M'Rorie, builder, Crieff, in connection with a Free Church building contract at Comrie, and concluding for 800*l.* as extras, &c. Both cases were tried in the Court of Session, and both aimed at setting aside the arbiter named under the contract, who happened to be the architect and engineer of the works. The results were very dissimilar. Mr. M'Rorie in the First Division of the Court succeeded, while Mr. Mackay (whose case was sent before the Second Division Judges) failed. The Court held that the clause of reference to the engineer as arbiter excluded the action. Manifestly this is a hard case, and as it is one intimately affecting the rights and whole position of contractors, it ought not to be lost sight of or allowed to remain where it is. It might be worth while carrying the case further. It is well known that the English Courts take a much more common sense view of these matters than our Scottish Courts, and I have heard of a case where it was distinctly laid down by English Judges "that an engineer could not be an arbiter of his own work." I do not know if Mr. Mackay intends to carry this case to the House of Lords, but in connection with it I would make a suggestion. It is this, that the builders and contractors of Scotland, as parties most interested, should take the question up and fight the case out in the House of Lords with the very best counsel that can be got. In this way only can we ever hope to arrive at a test subject, and I shall be very glad to contribute my share to the expenses. Two or three others personally known to me have volunteered to do the same. The point is so important to the contracting world that it is worth settling in the highest tribunal of the realm; but the burden should not be allowed to fall on any one person. Let contractors speak out then and take some action on the subject, for unless they do something to resist the dangerous inroads made by some professional men on their rights and liberties they will be parties themselves to driving respectable men out of their ranks, because to endure such treatment is neither consistent with honour nor independence.

### ART WORKMANSHIP.

**The Newcastle Pastoral Staff.**—A staff, which was designed by Mr. R. I. Johnson, has been presented to Dr. Wilberforce. It is of carved ivory, with adornments of silver gilt. The total length is 6 feet 3 inches. The staff is in four pieces, which are joined by sockets of silver gilt *repoussé* work with screws, so as to be readily taken to pieces. The upper and most important portion consists of the crook, with the knop beneath it. The diameter of the crook is 4½ inches, and within it is a sculpture of the Annunciation in ivory, which is used as indicating the doctrine of the Incarnation. The under side of the crook is supported by an angel in ivory with outstretched hands, and the outer edge is decorated by small silver-gilt crockets. Below the crook comes the knop, which is all of silver-gilt tabernacle work. It is hexagonal in form, and has six niches, containing the following figures: 1. St. Cuthbert. 2. An angel bearing a shield with the arms of the See and Bishop. 3. St. Aidan. 4. An angel with a blank shield. 5. St. Nicholas. 6. An angel with a blank shield. Beneath is a band of delicate tracery, and the composition is enriched by crocketed pinnacles and canopies, and supported on a carved and ogee-formed bracket, springing from an embossed ring that surmounts the upmost socket of the shaft. Around this socket the following inscription is engraved on a spiral ribbon: "In honorem Dei et ecclesie decus, Bacuum longi Episcoporum ordinis Futurum ut sperant gestamen Læti primo Præsuli Novocastrenses dedicant MDCCCLXXXIII." The total length of this portion of the staff is about 19½ inches. The staff itself is carved with a delicate spiral ornament, and its lower termination is a silver-gilt *repoussé* socket.

### ENGINEERING WORKS.

**The Shustoke Reservoir, Birmingham.**—The new storage reservoir which has been constructed in connection with the Birmingham Waterworks was opened recently, by the chairman of the Water Committee of the Corporation. Its area is nearly 90 acres, and in form it is an irregular parallelogram, 1,300 yards long by 400 wide, and its capacity 420 million gallons. The depth varies from 16 feet at the upper end to 25 feet at the lower, the average depth being 20 feet. At the bottom is a natural bed of solid clay, and the artificial embankments are rendered impervious by having in their structure a puddle trench 63 feet 6 inches wide at the base carried from a depth of 14 feet below the natural surface of the ground to a height of 3 feet above the top water level. The greatest height of embankment is at the Whitacre end—namely, 30 feet 6 inches, and this has a thickness of 234 feet at the base and 20 feet at the summit. The inner slopes are protected by substantial layers of concrete made with Portland cement, while for two yards above and below the top water level boulders are pitched in the concrete to resist the wash of the waves. After passing through the reservoir, the water flows by a line of pipes to the filter beds, seven in number, at Whitacre pumping station, which are capable of passing 12½ million gallons in

twenty-four hours, and thence the water will be forced through a 36-inch main to Minworth, where it meets the water from Plants Brook, and flows on in divided streams to Aston. The contract for the work, including the construction of a small supplementary reservoir, which holds 20 million gallons, and which filters the water from the river Bourne, was taken at 78,900*l.* by Messrs. John Aird & Sons, exclusive of buildings and pumping plant, supplied by Messrs. Watt & Co., and of the land, which cost 35,000*l.* By this extensive addition to their works the Birmingham Corporation have raised their storage accommodation to 607 million gallons, a quantity which would enable them in time of drought, and supposing the regular supply from wells and streams were suddenly to fail by one-half, to dispense 14 million gallons of water daily for 100 days, which is believed to be ample to meet the requirements of the district for many years to come. When the Corporation took over the water supply from the old waterworks company in 1875, 8½ million gallons of water were being pumped daily to supply the wants of Birmingham and the adjacent district. The works have been carried out from the designs and under the superintendence of Mr. J. W. Gray, the engineer of the water department. Mr. N. T. Gray, was clerk of works.

### CHURCH BUILDING AND RESTORATION.

**Wrexham.**—The foundation-stones of a new Welsh Wesleyan chapel have been laid. The cost of the building, which will contain seats for 250 worshippers, is estimated at 1,800*l.* The architect is Mr. Alfred C. Baugh, of Wrexham, and the contractors are Messrs. Hughes & Owen, of Penybryn.

**Moulsham.**—St. John's Church, which has been undergoing improvement and enlargement, has been reopened. The old tower at the west end of the church, and the whole of the west front have been removed, the nave lengthened by 22 feet, and a new tower of larger dimensions built. The work has been carried out by Messrs. Brown, of Chelmsford and Braintree, from the designs of Mr. Fred Chancellor.

### GENERAL.

**Mr. Herkomer, A.R.A.**, has been awarded a first-class medal by the jury of the International Art Exhibition, at Munich.

**The Dunfermline Fine Art Association** will open its first exhibition on December 1.

**The First Exhibition of the Hawick Fine Arts Association** was opened in the Exchange Buildings, on Monday. About nine hundred works are exhibited.

**Mr. James G. Laing**, of Glasgow, has obtained the first prize (20*l.*) for the best water-colour drawing contributed to the Welsh Eisteddfod. Mr. Laing is one of the recently-elected Associates of the Scottish Society of Water-Colour Painters.

**Professor Ferrario** has been awarded the prize for the best design for the façade proposed to be built for the cathedral of Milan.

**Mr. W. H. Wormleighton**, of Cardiff, took first prize at the National Eisteddfod for stone carving, with a Portland stone panel of original design in modern Renaissance style; first prize in wood carving, with a boxwood figure of *Moses descending from the Mount*, and second prize in applied design with a sgraffito panel. Mr. Alma-Tadema, R.A., and Mr. Frederick Wedmore were the adjudicators.

**A Design**, by Mr. James Wilson, architect, Leeds, has been selected for a limited competition for the new Wesleyan chapel, at South Elmsall, near Doncaster. The works will be shortly commenced.

**The Works at the Opera House** on the Thames Embankment are to be resumed, and Messrs. Perry & Co., of Bow, have, it is said, undertaken to complete the building in time for the season of 1884. Mr. Mapleson is the lessee.

**Fort House, Broadstairs**, which is better known as "Bleak House," where the late Charles Dickens frequently resided, has been sold by auction for 2,500*l.* Lawn House, adjoining, which was also an occasional residence of Dickens, was sold for 730*l.*

**Offices for the "North Star,"** erected from the designs of Mr. G. G. Hoskins, architect, have been opened at Darlington.

**The Lambeth Vestry** have decided to build a new town hall and vestry offices, the estimated cost of which amounts to between 40,000*l.* and 50,000*l.*

**The Bradford Corporation Gasworks Report** shows a profit of 10,000*l.* on the undertaking during the past half-year, against 6,400*l.* in the corresponding period last year.

**The Glenboig Union Fire-Clay Company, Limited**, have been awarded a gold medal for their exhibits of fire-bricks, fire-clay gas retorts, glazed sewage pipes, &c., at the Amsterdam International Exhibition.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, AUGUST 18, 1883.

### TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*\*\* Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Supplement to THE ARCHITECT."*

### EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

### COMPETITIONS OPEN.

**BRISBANE.**—Nov. 30.—Plans are invited for the Erection of a Town Hall. Messrs. Gordon & Gotch, 15 St. Bride Street, E.C.

### CONTRACTS OPEN.

**ABERDEEN.**—Aug. 27.—For Supplying and Erecting of Two Gasholders and Construction of Brick Gasholder Tanks. Mr. Alexander Smith, Gas Office, Broad Street, Aberdeen.

**BALLYWATER HARBOUR.**—Sept. 5.—For Building Stone Beacon on Sculmartin Rock. The Secretary, Irish Lights Offices, Dublin.

**BARNARD CASTLE.**—Aug. 18.—For Building North-Eastern County School. Mr. R. J. Johnson, Architect, 3 Arcade, Newcastle-on-Tyne.

**BATLEY.**—For Additions to Grammar School. Mr. Walter Haustock, Architect, Branch Road, Batley.

**BECKENHAM.**—Sept. 3.—For Additions to Stables and Buildings at the Old Manor House. Mr. F. Stevens, Clerk to the Local Board, Beckenham.

**BELFAST.**—Aug. 27.—For Building Goods Shed on Donegall Quay, with Malleable Iron Roof, Cast-iron Columns, &c. Mr. W. Thompson, Harbour Office, Belfast.

**BREWCASTLE.**—Aug. 24.—For Building Bridge at Clatterford. Mr. J. A. Cory, County Surveyor, Carlisle.

**BISHOP AUCKLAND.**—Aug. 22.—For Building Chapel, Superintendent's House, and Entrance Gates at Cemetery. Mr. J. P. Pritchett, Architect, 24 High Row, Darlington.

**BLACKBURN.**—For Making of New Road from Hollinshead Mill to Halliwell Bridge, Fockholes, distance about three-quarters of a mile. Mr. James Bertwistle, Surveyor, Blackburn.

**BLACKBURN.**—For Drainage of Ellenshaw Terrace and Ryal Farm, Fockholes, for the Blackburn Rural Sanitary Authority. Mr. James Bertwistle, Surveyor, Blackburn.

**BLACKPOOL.**—Aug. 20.—For Additions to Victoria Hotel. Mr. Thomas P. Worthington, Architect, Blackpool.

**BRITON FERRY.**—Aug. 27.—For Additions to Chapel. Mr. H. Francis Clarke, Architect, Briton Ferry.

**CAMBORNE.**—Sept. 1.—For Building Mission Room and House. Rev. W. P. Chappel, Rectory, Camborne.

ESTABLISHED A.D. 1774.  
ROYAL  
LETTERS PATENT.**AUSTIN'S**NEW IMPERIAL PATENT  
**SUPERFINE FLAX LINE.**

The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making five qualities; and they strongly recommend that in all cases they should be purchased in preference to the patent lines made from jute, which article has neither the strength nor the durability of flax, consequently cannot give so much satisfaction to the consumer.

They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.

They can be obtained of all Rope-makers, Ironmongers, Merchants, Factors, and Wholesale Houses in town or country.

N.B.—Please note that all our goods as advertised above are labelled either inside or outside with our Trade Mark—The "ANCHOR."

EXHIBITION MEDAL, 1874.

**WILKINSON'S CONCRETE**  
**STABLE FLOORING**

Has, after considerable inquiry, been adopted by the War Department for Stables at Shorncliffe Camp, Canterbury, Wealdon, Birmingham, Newcastle, &amp;c. It has also been largely used for stables and stable-yards of the nobility and gentry in various parts of the kingdom, and is specified by many leading London and provincial Architects. 400 (stable floor) references on application.

# The Architect.

## ÆSTHETIC VIEWS OF DRESS.

**L**HOLIDAY-TIME seems a fitting time for saying a word upon any subject of light and airy interest. Such a subject, wholly artistic—for it is only the artistic aspect of the question which we would dare to entertain—is to be found at the present day in the article of dress. A great deal is being said about dress. A public Association exists for the purpose of agitating about it. The way in which we make our clothes, and put them on, and deal with them altogether, is pronounced by many earnest and thoughtful people to be so wholly bad, so unsuitable to our conformation, so detrimental to our business, so prejudicial to our health, and so discreditable to our taste, that they don't know what to do with us. Men's dressing and women's dressing alike are entirely objectionable, and alike demand immediate and radical reform. In such circumstances we do not suppose that argument of anything like an architectural character would be able to secure attention, or, having haply secured it, could hope to succeed in overcoming the difficulties which surround the problem; but nevertheless, there is one very simple, and, we think, very sound reason why something not unlike architectural argument ought to be fairly tried amongst the rest. For, as we have ventured to assert on more than one occasion, architecture fulfils a peculiarly important function in these days, in being the best basis for the study of decorative-constructive art of all kinds whatever; and costume properly considered—or we are very much mistaken—is a decorative-constructive art and nothing more. The principles of criticism, therefore, upon which the handling of both the useful and the ornamental elements proceeds in the matter of building up a house may not unlikely be found, if only in an indirect rather than a direct way, to suggest corresponding principles for even such a matter as the building up of a costume—in other words, the ornamental clothing of a man or a woman.

It need not surprise anyone who is accustomed to observe the odd turns and twists of the revolutionary movements of mankind when we point out the curious fact that, amongst our English dress reformers, gentlemen are found to be of opinion that male attire ought to approach existing feminine forms, while ladies no less are disposed to think the costume of their sex ought to borrow something from that of the other. This incident only shows that both styles of the dressing art are very much in the right, if both are a little in the wrong. Is it not so, after all, in most things—perhaps in everything? When SAM WELLER quotes the maxim, "Whatever is right," he indicates, as all moderately wise persons well know, the great and everlasting truth that the decrees of fate are the necessary and appropriate consequences of the conditions of the time, and work out the greatest good of the greatest number. Evolution claims even our garments for its own; the survival of the fittest is still the rule of development; and breeches will keep possession of the world when bloomers are forgotten and divided skirts an exploded superstition.

Now why it is that a gentleman wears the precise garments he does (speaking of essentials), and a lady the wholly different articles which are assigned to her, it is perfectly useless to inquire. The distinction, in very much the same form, is found to exist in all civilised nations, and to have existed from sufficiently remote antiquity, exceptions only proving the rule. Those objectors, therefore, who would exchange the first principles of our attire would be only running counter in some way to the first principles of our nature, were it not that their desired exchange really goes no further, whether they know it or not, than a suggestion that certain points of neutral ground might be a little more freely occupied by both the one sex and the other for the sake of the convenience of each. But this may be conceded without doing either much harm or much good; it has only to be borne in mind that the concession must not be considered to involve any confusion of those essentials of custom which, being universally established as they are, are placed beyond the reach of profitable debate.

There is one remarkable difference between male dress and female, which cannot be too soon adverted to. It is said that there are men, chiefly young, who are able to perceive in the masculine attire of the passing moment a considerable diversity of design, where to the eye of others there is nothing but universal uniformity. But when we come to the attire of women, who can fail to see the almost infinite variety of pleasing effects which it is capable of displaying? There are actually books published season by season, and even journals week by week, in which, to the eye of the mere philosopher, the multitudinousness of the examples of artistic feminine clothing, all equally good of their kind, is simply overwhelming; whereas it is not too much to say that no corresponding collection of garments masculine has ever reached, or ever could reach, beyond the limits of a common tailor's show-card, which, to all appearance, nobody ever looks at except as a trade-sign. The reason for this lies in two directions. First, there is the more artistic intelligence of women; but secondly, there is the more available artistic character of the mode of dress which they have universally adopted. Again, therefore, we conclude that the first principles of dress are right: certainly for women, and why not for men? We are consequently in every way disposed to say, further, that the philosophy of dress really consists, not in any inquiry by amateurs into the elementary suitableness of the garments which we use, but in an artistic criticism of the various designs which are from time to time offered by experts for public acceptance as successive fashions.

An æsthetic dress, properly so called—and now we come to the quasi-architectural ground of decorative-constructive art—ought consequently to be such a design, on the accepted principles, as shall be appropriate to these several conditions—namely, the object of clothing, the climate, the season, the individuality of the wearer, the nature of the materials, and so on, not forgetting that natural sequence of superficial change, for the mere sake of change, which constitutes in dress, and not in dress alone, the general mode of one year after another.

One of the first questions of design is this: Is the effect of the costume to be natural, or artificial, or a combination of the two? Perhaps the best illustration of this question is to be derived from landscape gardening. We have the natural style of treatment, known as the English, the wholly artificial style, known as the Italian, and between the extremes of these there are any number of stages of combination and compromise. Now let us turn to the attire of a little schoolgirl in any of its very simplest forms, and probably there is no critic who would object to regard it as a fair specimen of the natural style of costume. As a proof of this, it may be said to undergo no change from age to age, except in the very slightest concessions to the changes of adult fashions. The natural shape of the child-woman, in all its native grace, is unconcealed if undisplayed, and the verdict is frequently extorted from the most unwilling judges that all the resources of art are unequal to the production of its equal. The same may be often said with regard to women of mature age and proportions, who, as a condition of their unconventional sphere of life, are clothed on the same principles. Out of this, then, the natural style may be said to be developed, and, when well done, the result must always be charming. For the artificial style, on the other hand, in its most characteristic exemplifications, we have only to look at such elaborate productions as the well-known devices of Queen ELIZABETH'S time. Every feature of the human frame is conventionalised, as we may say, to the utmost. Yet the effect of the artistic design may be in its way, and ought to be, most admirable. Like the terraces, balustrades, parterres, fountains, and all the rest of the "Italian garden," everything combines to substitute the artificial for the natural, and the whole becomes as pretty as a wedding-cake. Between the extremes thus indicated it is obvious that an illimitable range of intermediate combinations may be made available; and indeed it is in this field that almost all the genius of modern *modistes* has to operate. That is to say, the artistic criticism of a lady's dress nowadays must take the form of an inquiry, first, whether its naturalesque elements are sufficiently natural; secondly, whether its artificialism is appropriately artificial; and thirdly, whether the combination produces harmony or discord. Of course we do not pretend to say that it is enough to lay down such a law; but there is at least this to be said, that without some such law criticism must be in chaos.

When fashion involves a positive distortion of the figure, as in the case of lacing the waist, criticism of this artistic nature

still need not be at fault. It is probably an indisputable fact that women of sedentary habits generally require what they call "a support"; even such wild people as foxhunters—men—doing violence to themselves in quite another way, have to resort to very much the same expedient; but it is as a conventional artificiality in most instances that women really tamper with the waist, and as a means of emphasising a natural outline which cannot be denied to be one of the particular charms of the human form. It is idle, therefore, to denounce *in limine* the practice of having or making a waist; all that is desirable is that it should be kept strictly within its proper limits; and of course those limits ought always to be considered to recognise the question of health. To speak plainly, an expert designer of dress can deal as easily with a robust figure in a fine lady as an architect can deal with massive proportions in a church tower, and it is simply bad art to lace all the world tightly because perhaps two or three leaders of fashion are abnormally slim. In fact, in the opinion of the great majority of observers, a tight waist, or even a too slender waist, is beyond all doubt a blemish; and this of itself is proof positive on the point of taste.

The old-fashioned architectural rule of "fitness" is one that may be applied to costume with confidence. But fitness here means a great deal more than may at first sight appear; for it involves a reason for everything, and that the right reason. At the same time it implies to the artistically-trained intelligence what is almost much less than it would be thought to mean. Within admissible limits, there is no restriction whatever as to variety of device in dress; but one principle must never be lost sight of, that, however capricious the variety may be, the resources of design, if expertly administered, need never fail to produce, with harmony of outline, colour, and character, unvarying elegance and grace.

#### THOMAS WARTON.

THE credit is generally given to WALTER SCOTT of having made Mediævalism popular in England, and with reason it may be said that the revival of Gothic architecture was one of the results of the publication of "The Lay of the Last Minstrel" and "Marmion." But there was another poet before SCOTT whose influence as a factor in the revolution is too generally overlooked. The motto on the title page of the "Border Minstrelsy," with which SCOTT began his noble career of authorship, was taken from one of the odes which THOMAS WARTON produced in virtue of his office as Poet Laureate. It would not be difficult to show that in other and more important ways SCOTT was also indebted to WARTON; in fact, he has acknowledged his obligation. WARTON was not only the first scholar trained in an university who dared to show a liking for the ancient poetry of England, but he was probably the only Englishman of his generation who was able to appreciate Mediæval art. It should be remembered, too, that he was brought up amidst surroundings that were adapted to instil in his mind the prejudices against that art which were characteristic of the Oxford don of the eighteenth century. WARTON's father had been professor of poetry in Oxford, and was besides a fellow of Magdalen College, probably at the same time as ADDISON. THOMAS WARTON entered Oxford when he was sixteen (he was born in 1728), and for forty-seven years he was connected with his college. At that time, every one who had the least claim to the possession of so-called taste was an exclusive admirer of what had been produced in literature and art, and especially in architecture, by Greeks and Romans. ADDISON, whose word was law in the common-rooms of Oxford, was of opinion that a man's taste might be estimated by the extent of his dislike of Gothic buildings. "Let any one," he wrote, "reflect on the disposition of mind he finds in himself at his first entrance into the Pantheon at Rome, and how the imagination is filled with something great and amazing; and, at the same time, consider how little, in proportion, he is affected with the inside of a Gothic cathedral though it be five times larger than the other, which can arise from nothing else but the greatness of the manner in the one and the meanness of the other." What was said by ADDISON corresponded with the opinion of the time, and Gothic architecture was held to be the fitting representative of a dark and superstitious age, and unworthy of the notice of the wits and scholars of the eighteenth century. It was in those days the belief of men who were supposed to be cultured that "elegant antiquity,"

meaning Greek and Roman remains, necessarily engaged attention from its intrinsic excellence; whilst "barbarous antiquity," that is, Mediæval work, ought not even to be looked at, lest custom should make people approve of what they ought to avoid.

While his contemporaries held those opinions it was strange to find a young poet professing to seek inspiration in Gothic churches. Yet this is what THOMAS WARTON ventured to do in "The Pleasures of Melancholy," which he wrote in his seventeenth year. One passage will suggest his mode of thought:—

The tapered choir, at the late hour of prayer,  
Oft let me tread, while to the according voice  
The many sounding organ peals on high,  
The clear, slow-dittied chant, or varied hymn,  
Till all my soul is bathed in extasies  
And lapped in paradise. Or let me sit  
Far in sequestered aisles of the deep dome,  
There lonesome listen to the sacred sounds  
Which, as they lengthen through the Gothic vaults  
In hollow murmurs reach my ravished ear.

It is not necessary for us to determine the value of the lines as a piece of poetry. CAMPBELL considered that the poem from which they are taken gave promise of more sensibility than was afterwards fulfilled by the author. But they may be said to be unique, for it would be impossible to find an extract in the poetry of that age which expressed as much admiration for an English Gothic church. Soon afterwards WARTON ventured to oppose the project for filling the window of the Chapel of New College with painted figures in the modern academic style. He knew that REYNOLDS, although he might be equal to TITIAN as a painter, was unfitted for the task. With some tact he made it appear that it was only the delight of a dreamer, like himself, which was involved, one who did not profess to be a fine gentleman, but who used

With Gothic manners Gothic arts explore,  
And muse on the magnificence of yore.

And then he went on to relate some of his own experiences:—

Enraptured have I loved to roam,  
A lingering votary, the vaulted dome,  
Where the tall shafts, that mount in massy pride,  
Their mingling branches shoot from side;  
Where elfin sculptors, with fantastic clue,  
O'er the long roof their wild embroidery drew;  
Where Superstition with capricious hand,  
In many a maze the wreathed window planned,  
With hues romantic tinged the gorgeous pane,  
To fill with holy light the wondrous fane;  
To aid the builder's model, richly rude,  
By no Vitruvian symmetry subdued,  
To suit the genius of the mystic pile;  
Whilst as around the far retiring aisle  
And fretted shrines, with hoary trophies hung,  
Her dark illumination wide she flung;  
With new solemnity, the nooks profound,  
The caves of death and the dim arches frowned.

The description of an interior we have quoted may appear to be wanting in precision, but it is perhaps an impossibility, when dealing with a building, to be poetic and technically correct at the same time. SCOTT, with all his archaeological lore, was unable to accomplish the feat. In his most elaborate word-picture he could only represent the forms of Gothic tracery by suggesting that osiers had been twined in freakish knots and then by some fairy's hand changed into stone. It is not improbable that WARTON was ignorant of the terms which are used by architects and workmen to describe the various parts of a Gothic building, and when in one of his poems he says:—

Here ancient art her dædal fancies play'd  
In the quaint mazes of the crisped roof;  
In mellow glooms the speaking pane array'd  
And rang'd the cluster'd column massy proof,

he was unable to find better words than "crisped," "dædal," and MILTON's "massy proof," to express certain qualities which he admired. WARTON's archaeology was bookish, and was therefore likely to be vague at times, if not absurdly wrong. He once took great pains to explain that when SALADIN was said to carry a "faucon brode," it meant a falcon bird, and was a sign of contempt for the Christian warriors. A man who was not a scholar would have interpreted rightly the

phrase as meaning a broad falcion, a thing that was not out of place if carried by a Saracen. On the other hand, it may be said that if he avoided precise terms, he was merely observing the canon which prohibits the use of technicalities in poetry. MILTON, he knew, had been condemned by the critics for introducing such words as frieze, cornice, pilaster, and architrave.

In his prose writing WARTON was less restricted than in his poetry. It was almost a matter of necessity that he should attempt blank verse and rhyme, but he was able to speak more plainly in prose, and from it we can understand his sentiments plainly. We are told that during the vacations he was an explorer of architectural monuments, and that he made it a rule to record his remarks. But of the value of his researches it is not possible to judge, for his notes have not been printed. CAMPBELL seems to think that what gave value to a building with WARTON was the poetic or historic associations, and accordingly doubts "whether he would have ever looked with interest on a shepherd's cottage if he had not found it described by VIRGIL or THEOCRITUS." But cottages, whether classical or English, do not appear to have had much attraction for WARTON. Among secular buildings, nothing less than a castle was worth his notice. When he saw Windsor Castle for the first time he was overpowered by the spectacle, and even CAMPBELL has to admit that WARTON can be impressive when sketching the appearance of an ancient Gothic castle. He then became picturesque, and was as careful in selecting his point of view as if he were a landscape painter. WARTON knew the importance of leaving something to the imagination by making a part suggest the whole. MILTON's lines—

Towers and battlements it sees  
Bosom'd high in tufted trees,

were therefore to him not only perfect in expression, but descriptive of the characters he most admired in English domestic architecture. Here is his comment on the passage:—

This was the great mansion-house in Milton's early days, before the old-fashioned architecture had given way to modern arts and improvements. Turrets and battlements were conspicuous marks of the numerous new buildings of the reign of King Henry VIII., and of some rather more ancient, many of which yet remained in their original state unchanged and undecayed; nor was that style, in part at least, quite omitted in Inigo Jones's first manner. Where only a little is seen, more is left to the imagination. These symptoms of an old palace, especially when thus disposed, have a greater effect than a discovery of larger parts and even a full display of the whole edifice. The embosomed battlements, and the spreading top of the tall grove on which they reflect a reciprocal charm, still further interest the fancy from novelty of combination; while just enough of the towering structure is shown to make an accompaniment to the tufted expanse of venerable verdure, and to compose a picturesque association. With respect to their rural residence there was a coyness in our Gothic ancestors. Modern seats are seldom so deeply ambushed. They disclose all their glories at once, and never excite expectation by concealment, by gradual approaches, and by interrupted appearances.

It will be seen that WARTON considered the English houses of the eighteenth century were less fitted to excite agreeable associations than the more ancient houses. In a similar spirit he maintained that even the greatest example of the Church architecture of the eighteenth century—the Cathedral of St. Paul's—was not so awe-inspiring as its predecessor:—

Old Saint Paul's Cathedral, from Hollar's valuable plates in Dugdale, appears to have been a most stately and venerable pattern of the Gothic style. Milton was educated at Saint Paul's School, contiguous to the church, and thus became impressed with an early reverence for the solemnities of the ancient ecclesiastical architecture, its vaults, shrines, aisles, pillars, and painted glass, rendered yet more awful by the accompaniment of the choral service. Does the present modern church convey these feelings? Certainly not. We justly admire and approve Sir Christopher Wren's Grecian proportions. Truth and propriety gratify the judgment, but they do not affect the imagination.

WARTON must have forgotten the passages he read in the Elizabethan dramatists about Old St. Paul's. There was not an ecclesiastical building in Europe which was more degraded. While Paul's Walk was the haunt of the worst characters, neither the length nor the style of the building could be sufficient to create reverence in men's minds. The studious cloisters, high embowered roof, and storeyed windows which MILTON loved need not necessarily have belonged to the Old St. Paul's; they were to be found in many parts of the kingdom,

and were only some of the features common to Gothic buildings which were calculated to attract a poet's observation. But enough has been said to suggest that WARTON was one of the pioneers of the Mediæval revival. It has been stated that his fondness for the beauties of architecture was an absolute passion: if so the passion was concentrated on one form, and that was English Gothic.

## PARIS NOTES.

ALL the works in the painting and sculpture sections of the Triennial Salon have already been sent into the Palais de l'Industrie, and for the present are lying about the floors of the building in great confusion. The whole of the centre part of the great nave devoted to the sculpture exhibits is being laid out as a garden, with grass plots, shrubberies, &c.; and this novel and most agreeable way of exhibiting the statuary amid flowers and verdure will probably prove one of the chief attractions of the Salon. The most noteworthy exhibits to be seen in the great triennial exhibition will certainly be the works of the great painters who have not lately taken part in the annual Salons, such as Jules Dupré, who sends eight pictures hitherto unknown to the public; and M. Meissonnier, who contributes the following: *A Reconnaissance by Dragoons of the Republican Army in the Black Forest*, sold recently to M. Crabe, the Belgian amateur, for 300,000 frs.; *Le Concert*, a woman singing while a man is accompanying her on the spinet; *La Visite au Château*, which contains more than thirty small figures, many of them portraits; *The Interior of St. Mark's, Venice*, with a solitary figure; and the portraits of M<sup>me</sup>. Mackay and of M. Lefranc, already seen at the Cercle des Mirlitons. Among the sculptures a *Mozart Jeune*, by M. Barrias, is generally spoken of as a masterpiece.

André Gill, the celebrated caricaturist, whose brain has been so affected for some time past that it was found necessary to confine him in the Charenton Asylum, appears to be showing signs of returning sanity. Being visited lately by M. Emile Cohl, one of his old fellow-artists, he begged him to endeavour to obtain for him a separate room, in which he might resume his literary and artistic labours, hoping thus to recover the full possession of his reason. The manager stated that he might authorise the artist to occupy a room for which he would have to pay 75 frs. per month. A collection made by M. Cohl for that purpose has now enabled poor Gill to have, not only a room, but a servant; and a fund has now been started to make the arrangement permanent, subscriptions to which may be sent to M. Cohl at his residence, 36 Boulevard Henri IV., Paris.

The Academy of Fine Arts has received from the Ministry of Public Instruction the first volume of the general inventory of French art treasures, now in course of preparation. This first portion of the work is devoted to the public monuments of the country.

The jury of the Munich International Exhibition of Fine Arts has awarded first-class medals to the following French artists: For painting, to MM. James Bertrand, Bastien Lepage, and Emile Rénouf; for sculpture, to M. Strax; for architecture, to the French Commission of Historical Monuments. Second-class medals have likewise been bestowed upon MM. Echtler, Aublet, Courbois, Dantan, Gervex, Luminais, Santin, and Tattegrain, painters, and upon M. Beruvier, architect.

Three fine marble statues have been lately placed in the empty niches on the ground-floor of the northern front of the Louvre. They are a *Venus*, by Vilain, with a rose in the right hand and the torch of love in the left; *Campaspe undressing before Apelles*, by Ottin; and *Venus Triumphant*, holding the trident of Neptune, by Devoux.

The Duc de Camposeliée has offered for the Ischia tombola, or lottery, now being organised by the French press, a bronze statue of *Music*, considered the masterpiece of the sculptor Delaplanche, and the Duchess has subscribed 10,000 frs. to the fund.

An amusing dispute has arisen between the Paris municipal authorities and M. Auguste Vitu, an eminent journalist. On the front of the house standing at the corner of the Rue St.-Honoré and the Rue de Valois, a marble slab has lately been placed, with an inscription which stated that there stood the theatre of the Palais-Cardinal, built by Le Vau in 1641, occupied by Molière and his company from 1661 to 1673, and used for some time as the headquarters

of the Royal Academy of Music. M. Auguste Vitu maintains that the inscription is wrong, as neither the Palais-Cardinal theatre nor any other portion of the palace ever occupied the site. It is also said that Le Vau did not build either the theatre or the Palais-Cardinal, and, finally, the theatre that was opened on the site in 1770 for the Royal Academy of Music was never once used by Molière or his company. M. Vitu attributes the construction of the Palais-Cardinal, not to Le Vau, but to Le Mercier. The theatre was in the right wing of the palace. Molière and his company enjoyed the use of the great hall in the Palais-Royal from 1661 until the death of the poet in 1673. M. Henri Martin, president of the Municipal Inscription Committee, is now compelled in self-defence to bring forward the documents upon which he relied for the text.

Another street of old Paris has been obliged to abandon its time-honoured name. The Rue Tiquetonne, in the St.-Eustache quarter, will be known henceforth (or until another name is substituted) as the Rue du Petit-Lion-Saint-Sauveur. The name of Tiquetonne had a curious origin. During the fourteenth century, at No. 7 of the street stood a pastrycook's, with the sign "Rogier de Quiquetonne, Seigneur de la Fournée," and, underneath, the picture of a cook carrying a sword and yet engaged in making cakes. This establishment had a universal reputation, and it was the fashion to repair thereto in the afternoon to eat honey-cakes. It thus gradually became the rendezvous of all the great people of the Châtelet, St.-Eustache, and St.-Opportune quarters, and when the ladies had arrived, and the young bloods began to put in an appearance, the great Sir Rogier de Quiquetonne (he was really of noble birth) came out in his gaudy dress, with sword by side, to wait upon his high-born customers. At the time of the revolution of the Maillots, the house was attacked by the mob and pillaged. The provost of the merchants, being informed of this, awarded Rogier a handsome compensation, and changed the name of the street to Quiquetonne, which afterwards became corrupted into Tiquetonne.

For many years past the beautiful belfry of the Church of St. Merri, in the Rue St.-Martin, has been threatened with destruction through the ravages of time. Various efforts have been made to strengthen the tower, the removal of which would entail the mutilation of one of the purest and most beautiful specimens of Gothic architecture in Paris. These have, unfortunately, proved ineffectual, and, in consequence of its precarious state, it has been found necessary to order the demolition of the upper part, which will be temporarily replaced by a wooden roof. In the meantime the city architects have been requested to make out plans for the restoration of the part removed in keeping with the character of the edifice.

## ENGLISH AND FOREIGN SYSTEMS OF ART TEACHING.

THE following comparison between the English and Continental systems of teaching is by Mr. T. Armstrong, the Director for Art at South Kensington:—

First, I would call attention to certain conditions under which art teaching is carried on in these countries which are, I consider, more favourable than ours. In all of them the working classes can, and in some do, give up the Sunday to art work. In Saxony and Bavaria the Sunday teaching is certainly a most powerful factor, and, although we saw no classes at work in France, I was present in Paris at a competition in drawing and modelling in which 360 workmen took part between nine and five on a Sunday. I am not called upon, I know, to give an opinion as to the expediency of using Sunday in this way, but it is clearly a great gain to have a free day on which all working men can come together for competition. In Germany, Sunday is the great day for instruction in the Fortbildung School, and we were told that it was a common practice for masters to set their apprentices and workmen at liberty to attend art classes on Thursdays in the afternoon.

In no instance did we find anything equivalent to the management of our schools by voluntary committees. They were in all cases under the direction and control of a central authority, either the State or municipality, which was able both in France and Germany to provide itself with a competent staff of inspectors and directors through the high academical teaching and discipline which is traditional. This is especially the case in France, where a noble tradition of art teaching is preserved by the Académie des Beaux-Arts, a body which is in no way mixed up with commercial interests, and is thus free to maintain the highest view of art instruction. From this source are obtained officials for the direction of art schools, and museums who have had the best possible train-

ing. The art masters of many provincial schools in France are yet, it is admitted, far below the standard it has been thought desirable to fix, and great efforts are being made to fill up vacancies as they occur with well-trained teachers, holding diplomas.

In all the towns we have visited except Lille there survive art traditions such as do not exist in London, Glasgow, Manchester, or other large towns in this country. Worcester and some of the older pottery towns may have some such traditions, but I do not know that it is so. Paris has long produced largely, not only for its own adornment but also for export, articles which derive their value from dainty and artistic workmanship. The Parisian workman has for many generations been in contact with buildings decorated externally with good sculpture, and internally with wall paintings, with wrought metal and marble carvings. In the ceremonial of the churches he has, besides, been familiarised with the most beautiful woven stuffs which are used for sacerdotal vestments. Out of doors he has been accustomed to see good statues in the public gardens.

On Sundays he has been able to visit museums containing not only good pictures, but beautiful furniture, and the choicest examples of decorative art. London workmen can now see such in the South Kensington Museum if they care to go so far when the day's work is over, but they cannot see them on Sunday. The Paris workman and his father and grandfather have had these opportunities, and, besides, have lived in a sort of artistic atmosphere which cannot exist in towns where the people engaged in art work are few and scattered, and where there is not the sort of stimulus which comes of sympathetic surroundings, nor the direction of another stratum of art-workers trained under such auspices as those of the Ecole des Beaux-Arts.

In Munich there was during the reign of King Louis a lavish expenditure on works of art, on art teaching, and on pageants carried out under the direction of accomplished artists. The moderate size of the town allowed of the inhabitants getting familiarised with the practice of decorative art without going far from their homes. In Dresden there has been for 200 years an art manufacture which has been a source of pride and profit to its inhabitants, and fine examples have been accessible to them in the gallery of pictures and the other royal or national collections. In Nuremberg there is a survival of the art manufactures for which it was famous centuries ago, debased it may be, but still living.

I have insisted on this point at some length because I do not think it is fair to our system of teaching to judge it from results produced on populations raw and unprepared to receive impressions of beauty, and, from want of familiarity, not eager to come towards fine examples, with other systems applied to people who are prepared unconsciously, not only in their own early years, but congenitally through several generations of ancestors. I do not believe that the French peasant, and still less the German, is more easily trained to be an art workman than the English peasant, nor do I think the bourgeois class in Paris superior in that respect to a similar class in London; but the artist and the art workman in Paris, in Munich, in Dresden, and in Nuremberg, has the start of us, and it would be foolish not to realise that, in some respects, we carry extra weight in the race. These hindrances in the race of competition with our neighbours are what, I take it for granted, we must bear for the present, and perhaps for some time to come; for we cannot teach the dead grandfathers of our potters and cabinet-makers, and the Sunday work cannot be looked to.

We did not find in either France or Germany anything resembling our system of combined payment by fees and results, a system which certainly appeals to the strongest motives for human endeavour. It is not to be hoped that the average art master will neglect the commercial interests of himself and his family, if he have one, when he can, with credit to himself and his school in the eyes of the outdoor world, choose those grooves to run in which most easily bring payments to himself and prizes to his pupils. It is not fair to ask more of human nature. The endeavour, therefore, of the department has been, and must be, to so adjust the stimulus of its payments as to encourage sound methods of instruction.

The point in the German art teaching which struck us most, and from which there is, I believe, much to be learnt, is the preparation in the elementary schools for the teaching in the art schools. If freehand drawing ought to be taught at all in our elementary schools, every effort should be made to render the teaching more efficient. At Lord Spencer's request I made three visits to the Normal School in Marlborough Street, Dublin. There the master showed me that the time given to freehand drawing was too short to be useful. This would not appear from the papers of the school, but I found it out through his making the children in different classes declare, by holding up their hands, how many of them actually had the time allotted to drawing in the programme. I fear this is so also in many English schools. As drawing is not taught in 75 per cent. of our elementary schools, the boy of the artisan class who comes to the art school is with us almost always mere raw material; in Saxony and Bavaria he is universally trained to neatness of handwork, if to nothing more. There is clearly work to be done by us in this direction.

Some three or four months ago the London School Board engaged Mr. Ablett as inspector and teacher of the art of teaching

*pédagogie*, as the French call it. Mr. Ablett, under our department, has succeeded in producing extraordinary results at the Bradford Grammar School by systematic teaching. He is a man of great intelligence, with a love of teaching, and I hope we may soon see some results from his appointment. At present the winner of a certificate is not bound to show his power of imparting to others the skill and knowledge by which he has earned the distinction. Drawing under the present arrangement in the elementary school is not always profitable to the teacher, who can often obtain higher payment on results more easily in other subjects, and I believe (but of this I have no direct evidence) that on this account the time allotted on the programme to drawing is often taken for other subjects. If it should be thought expedient to teach drawing more efficiently in elementary schools, I should much like to introduce a system by which the best students should on leaving, by way of reward, be granted free instruction in the art classes or schools of art. This linking of the elementary to the advanced teaching has been suggested by Mr. Ablett, and I think much might be made of it. With improved teaching of drawing and more of it in our elementary schools we shall provide for the children of to-day, but in the meantime I should like something to be done for those who have grown up with no instruction at all.

It is quite certain that in most of our large towns not one-tenth of the number of those artisans who would be all the better workmen for some knowledge of and practice in drawing or modelling come to our schools or art classes. We should try to attract them, and for them some modification might perhaps be made in our system, which is, I think, more adapted to the wants of young people who may hope to enjoy continuous art education for some years, and who are from their stations in life somewhat delicate-handed, than to those of workmen who, after handling hammers, trowels, and saws all day, come to get their little training as draughtsmen at night.

Perhaps bolder and larger examples and a somewhat rougher method of execution might be introduced with advantage for these. A workman with a good eye and fair natural aptitude for seeing and rendering form who comes to draw as an evening student is, it seems to me, from the nature of the occupation at which he has been all day, somewhat disabled from copying neatly the small forms of our examples. At any rate I should like to try the effect of larger and coarser examples on this class, if we can get them to come in greater numbers to our schools. There can be no question as to the advantage to be derived by masons, joiners, cabinet-makers, and such like from learning drawing; first drawing with instruments, then freehand from flat examples, and afterwards from large and simple casts of ornament. The method of execution and amount of finish I saw at the competition of working-men in Paris would, I think, suffice. The schools or class-rooms should be as light and spacious and be kept as clean and bright as possible, and be made interesting by casts and photographs of good works of art. In some of our very smoky manufacturing towns this is difficult I know, but we have to compete with public-houses and music-halls, which, besides other attractions, have that of a bright and cheerful appearance. Much can be done to improve the lighting in our evening schools, and without great expenditure, if the students are made to draw in classes of six or eight, or more if possible, from perfectly-lighted examples. There would be economy of labour for the teacher, the spirit of emulation could not fail to improve the work; and if the examples were changed periodically it would not be possible for a student to dawdle for months over a single drawing.

I would have elementary modelling taught after very little drawing. Very simple appliances and the ordinary fittings will suffice for this in the early stages, and modifications in the system of payments in this kind of work are now being made which will, I hope, stimulate members and students to undertake it. Heretofore very little has been done, because the practice of modelling has been less profitable than that of drawing or painting. Our encouragement must therefore be higher.

My experience in France and Germany has not induced me to wish for any important changes in our system beyond that of accepting a rougher kind of work from artisans. In the advanced stages we may copy with advantage certain methods practised in Germany for stimulating the production of designs and copies of good works of decorative art. For instance, our students might be encouraged to produce models for metal work, which should be gilded or coloured and mounted at the expense of the schools, as in Bavaria. Opportunities for the execution of decorative painting might be sought for or created until a demand came from outside, as it would come when architects found such work could be done without the expense of bringing decorative painters from abroad. By travelling scholarships or otherwise we might have some of our best students sent abroad to make studies of decorative art and measured drawings of buildings, which should belong to the department. Something of this kind is now under consideration, and we hope to secure as examples some pieces of decorative distemper painting executed by a Munich artist for the principal room of the Nuremberg Exhibition, and which received a grand gold medal. Our museum at South Kensington would be more useful to the artificer or student if there was in the building a special room set aside

in which he could make a more thorough study of fine works than he can while they are in the show-cases. In the last issue of the Art Directory provision has been made for the execution of some decorative painting for the national competition, and I hope that both painters and modellers in the training schools may show before long that they are competent to undertake the best kind of decorative work.

The best work executed in our schools in drawing, modelling, and painting, is better than any of the same class we saw in Paris, Saxony, or Bavaria, but there is little of it. There is reason to believe that it will be produced in greater quantity, if the initiative can once be taken by young people who have from their surroundings been led to aim at picture-painting and bust-making rather than at decorative art. Help must be given to this end in finding opportunities for the carrying out of successful designs, and prizes should be awarded for works of this kind.

For the rest, I have only to say that our recent experiences in these foreign countries has not led us to the belief that the main scheme or system of art education in this country can be changed with advantage.

## THE HISTORY OF THE SOUTH KENSINGTON AND BETHNAL GREEN MUSEUMS.

A PERIOD of thirty years having elapsed since the scheme for the advancement of science and the fine arts was submitted to Parliament, an official history of the Science and Art Department has been prepared from which the following is taken:—

From the year 1837 up to 1849 models or casts, prints and examples, had been purchased as necessary means of instruction in design and ornamental art in connection with the Schools of Design. 1,299*l.* was spent, for instance, in 1844–45 in the purchase of miscellaneous examples from Paris. For some time these objects had been stowed away in Somerset House for want of space. They included casts of ornamental art of all periods, copies of Raphael's *Loggie*, specimens of manufactures, &c. In 1851 the Board of Trade appointed a committee to select objects notable "entirely for the excellence of their art or workmanship" for purchase to the amount of 5,000*l.* from the Exhibition of the Works of Industry of all Nations in 1851. These, together with the casts, models, and examples from the vaults of Somerset House, were transferred to Marlborough House, and Her Majesty the Queen and others lent valuable specimens which were placed with them. The collections thus formed were opened to the public as a museum of ornamental art on September 6, 1852. They were arranged in divisions such as textile fabrics, lacquer ware, ivory carving, jewellery, enamels, furniture, wood-carvings, paperhangings, pottery, stoneware, hard porcelain, soft porcelain, Sèvres, Dutch earthenware, majolica. A selection of casts of the Renaissance period was also shown.

No special provision had been sanctioned by Parliament for increasing the collection during the year. It was therefore proposed that an annual vote should be submitted to Parliament for the gradual formation of a systematic National Collection of Manufactures of all periods, the first of its kind apparently in Europe. Such a "collection of specimens which should illustrate both the progress and the highest excellence attained in manufacture, both as to material, workmanship, and decoration, had long been a most desirable object, and considered indispensable to instruction. Indeed a museum presents probably the only effectual means of educating the adult, who cannot be expected to go to school like the youth, and the necessity for teaching the grown man is quite as great as that of training the child. By proper arrangements a museum may be made in the highest degree instructional." (See First Report of the Department of Practical Art.) Concurrently a library of works upon art was commenced from the collection of books of reference on art, purchased in earlier years for the use of the School of Design. This became the National Art Library.

In November 1852, in view of a proposal to purchase additional objects for the Museum, a minute was passed approving of a proposal of Mr. Cole's, which concluded as follows: "As the collection of articles for the Museum proceeds, objects of the same kind but of various degrees of importance and value will be amassed, and in order to render the objects which could be dispensed with most available for the purposes of public instruction, I propose that local schools of art may have the privilege of purchasing them at half the prime cost. Hitherto specimens of manufacture have been presented to the schools; but, in future, I recommend that the gifts be few and exceptional." Thus the principles of both forming a normal central collection and encouraging the establishment of local museums were affirmed.

It was from the first considered desirable to make the collections of art useful to the provinces as well as to the metropolis. With this view small selections of objects from the Museum, and photographs and drawings of rare objects either temporarily deposited or by their nature not easily removable, were lent for study and exhibition to provincial schools of art. This was the

commencement of the system of circulation of art objects throughout the country.

Towards the end of 1852 the Bandinel collection illustrative of pottery and porcelain was acquired. A Special Loan Exhibition of Furniture was held by the department in 1853, at Gore House, Kensington, when a collection of Studies of the Life by W. Mulready, R.A., was also exhibited for the instruction of students in the anatomical and figure class. Purchases to the extent of 8,583*l.* were made in 1854 from the collection of Mr. Bernal, principally of specimens of pottery and porcelain, majolica ware, glass, and metal work. In the same year the Chancellor of the Exchequer (Mr. Gladstone) purchased the Gherardini collection of models for sculpture, which was placed in the art museum. This collection, inasmuch as it referred to a branch of art not necessarily connected with manufactures, helped in extending the limits of the collections generally, which henceforth became "art collections." In 1855 purchases of objects were made from the Paris Universal Exhibition, and negotiations were at this time commenced for acquiring a large collection of mediæval ornamental art from M. Soulages of Toulouse.

Catalogues of the collections were printed with the earlier annual reports of the department and issued separately for public use; but as the collections increased it was determined to affix a descriptive label to each object. Accordingly in 1856 an inventory of the objects of art in the Museum, excluding British pictures and sculpture, was prepared, and a classification adopted to give a practical and instructive character to the sections of the Museum. Every object was labelled, the inventory entries serving the purpose also of labels. The classes of objects were defined as follows: Sculpture, glyptic and numismatic art, mosaics, painting, japanned or lacquered ware, glass painting, enamels, pottery, glass manufactures, works in metal, watches and clocks, jewellery and decorative objects in precious materials, arms, armour, and accoutrements, furniture and general upholstery, leather work, basket work, textile fabrics, bookbinding and book decoration generally, ornamental designs, drawings and engravings. Descriptive catalogues, with accounts of various classes of works of ornamental art, have been prepared from time to time by recognised authorities, and are intended to serve as standard works upon such subjects.

In 1856, Parliament voted 10,000*l.* for the transfer of the Department of Science and Art from Marlborough House to South Kensington. As respects the selection of the site at South Kensington the following particulars may be given: Upon the close of the Exhibition of 1851, a profit of over 150,000*l.* accrued to Her Majesty's Commissioners for that Exhibition. His Royal Highness the late Prince Consort, President of the Commission, proposed that this sum should be expended in the purchase of land to be devoted to institutions for promoting science and art. An estate was available for purchase in the neighbourhood of Hyde Park. It extended from Kensington Gore to Brompton. Parliament co-operated with Her Majesty's Commissioners in its purchase, and voted altogether about 181,000*l.* By gifts and purchases from the Exhibition of 1851, by gifts from the Society of Arts, &c., Her Majesty's Commissioners had become possessed of divers collections for public instruction in science and art. They applied in 1855 to the Government for assistance in constructing a building to contain these collections, and Parliament voted 15,000*l.* An iron building was accordingly erected under the supervision of the late Sir William Cubitt upon the south-eastern portion of the estate, which Her Majesty's Commissioners gave up to the use of the department. Her Majesty's Commissioners contributed 2,000*l.* for the building of refreshment rooms adjoining the iron building. They also expended 3,000*l.* upon internal fittings. In 1858 Her Majesty's Commissioners repaid 121,000*l.* of the money previously voted by Parliament, and the Government became possessed (under the Act Vict. 21, 22, c. 36) of twelve acres, valued at 60,000*l.*, of the south-eastern portion of the estate. The buildings thus erected, together with others already upon this portion of the estate, were used by the Science and Art Department for the museums of education, patented inventions, animal products, and ornamental art, the National Art Training School, and offices. On the site thus acquired the buildings have been erected for the remainder of the art collections.

The Lords of the Committee of Council for Trade, by minute dated February 6, 1857, accepted the trusteeship created by the deed of gift by which Mr. Sheepshanks transferred his valuable collection of pictures and drawings in order to found a gallery of British art in connection with the schools of art, and the Treasury sanctioned the necessary expenditure for the erection of a gallery to contain this collection. About the same time, in compliance with a suggestion of the Sculptors' Institute, space was allotted in the Museum for the exhibition of a collection of British sculpture. Thus a new division of the art collections was commenced, viz., British paintings in oil and water-colours, drawings, &c., and British sculpture.

An architectural museum had been founded in Cannon Row, Westminster, in 1851, by a private society as the nucleus of a "National Museum of Architecture." About 7,000 specimens, principally illustrative of Gothic art, had been collected. These were now handed over to South Kensington, and were arranged

with the Classic and Renaissance casts which belonged to the department. The Chief Commissioner of Works lent several architectural models to the Museum, and other persons made contributions. The fifth report of the department states that "there can be little doubt that if sufficient space be provided by the State for an architectural collection which shall properly display the architecture of all periods, the public will considerably aid in filling it."

In 1860 a Select Committee of the House of Commons was appointed to inquire and report concerning the South Kensington Museum. In the report of that Committee reference was made to the Fine Arts Committee of the House of Commons in 1841, who had reported that, "independently of the beneficial and elevating influence of the fine arts upon the people, every pecuniary outlay either for the purpose of forming or extending collections of art in this country has been directly instrumental in creating new objects of industry and of enjoyment, and therefore in adding, at the same time, to the wealth of the country." Evidence illustrated by actual specimens brought before the Select Committee of 1860, proved the soundness of the views enunciated in 1841, "and showed how by a judicious cultivation of the taste of purchasers and manufacturers, and by their action on each other, new branches of ornamental manufacture had been created within the last few years." The Committee arrived at the opinion that the South Kensington Museum in respect of its action throughout the United Kingdom, as well as the metropolis, is exercising a beneficial influence, and that it is fully deserving of continued Parliamentary support."

Donations to the art museum increased the number of sections of the art collections. The Grand Duke of Tuscany had presented a cast—Michael Angelo's *David* at Florence—and this, with original specimens of decorative and other sculpture in marble and stone, models in terra-cotta, the Gherardini collection already mentioned, laid the foundations for a collection of examples of decorative carving, modelling, and sculpture. By 1863 the art collections generally had so increased that the Lords of the Committee of Council on Education specially reviewed them, and directed that as some sections, mediæval art of Italy for instance, were well represented, "future purchases be confined to objects wherein fine art is applied to some purpose of utility, and that works of fine art not so applied should only be admitted as exceptions, and so far as they may tend directly to improve art applied to objects of utility. The decorative art of all countries should be completely represented. Second-rate works should only be acquired as substitutes until better works can be obtained. Where the taste of the age or country has been low, few specimens only will be necessary. Original works are to be obtained as far as possible, but where this would seem to be impracticable, the system hitherto pursued of representing the finest known examples by electrotypes, casts, and drawings will be followed, it being always kept in mind that the aim of the Museum is to make the historical and geographical series of all decorative art complete, and fully to illustrate human taste and ingenuity."

From 1853 the expediency of obtaining reproductions such as casts, photographs, and electrotypes of valuable works of art had been recognised, and in 1864 a minute was passed with the view of establishing relations between the department and continental museums. A list of foreign museums was prepared, and an international art inventory was compiled and published, but this was discontinued in 1879. It was known that in continental museums and other institutions, churches, and palaces, original objects were preserved which it could not be expected would ever become purchasable by this country. "Admirable substitutes of them might be easily obtained by various modes of reproduction with perfect safety to the originals." In 1867 His Royal Highness the Prince of Wales entered into a convention with several of the princes of the reigning families of Europe, for promoting universal reproductions of works of art for the benefit of museums of all countries. In course of time a number of important reproductions of monuments of various styles of art was procured, and a special court erected for the display of those larger specimens, such as the Trajan Column, the Santiago Gateway, the Fireplace from Bruges, Adam Krafft's sculpture from Nuremberg, the Sanchi Gateway, the Emperor Akbar's Council Seat, &c., which could not conveniently take their proper places in the historic series to which they belong. In 1881 it was decided to form a collection of casts of Classic sculpture illustrating the early history of Greek art. This new division of the Museum is in course of arrangement and organisation.

In addition to the acceptance, on loan, of works of art for temporary exhibition, special loan exhibitions of objects to illustrate a particular category of art in respect of objects of utility, or of methods of dealing with materials, have been held during many succeeding years since 1853. In 1862 a special loan exhibition of all classes of ancient works of ornamental art was held. In 1865 there was a special loan exhibition of miniatures; in 1870, one of fans; in 1872, one of ancient musical instruments; in 1873, one of decorative art needlework; in 1874, one of enamels on metals. But beyond the scope of such exhibitions, a series of three national portrait exhibitions, suggested by the late Earl of Derby, was carried out by the department during the years 1866, 1867, and

1868 in the southern galleries overlooking the Royal Horticultural Gardens. Two other special exhibitions have taken place—one to illustrate Spanish art, the other, in 1882, Scandinavian art.

Many valuable bequests have been made to the department for the art collections, and the India Museum was transferred to the charge of the Science and Art Department in 1879. Besides the gift of pictures by Mr. J. Sheepshanks in 1857, already referred to, the following more notable gifts and bequests may be mentioned: In 1860 and in 1873, by Mrs. Elizabeth Ellison, 100 water-colour drawings, for the purpose of forming a national collection of water-colour drawings. In 1864, by the Rev. R. Brooke, 396 objects, consisting of textiles, watches, rings, &c., and 718 volumes of books. In 1867, by Mrs. Wollaston, 270 drawings of mosaics. In 1867 and 1868, by Sir Chas. Wentworth Dilke, Bart., M.P., 297 volumes, 862 pamphlets, and 155 prints illustrating the Great Exhibition, 1851. In 1868, by Mrs. Louisa Plumley, 43 enamel paintings by Essex, Bone, &c. In 1868, by Professor Ella, 329 volumes of music, printed and in MS.; 6 busts, 1 oil painting (a portrait of Rossini) from the library of the Musical Union Institute. In 1868, by the Rev. Chauncy Hare Townshend, 211 objects, chiefly jewels, 189 oil paintings, 174 water-colour paintings, 4,218 Swiss coins, 831 volumes, 390 drawings, 1,815 prints. In 1869, by Rev. Alexander Dyce, 80 pictures, 63 miniatures, 802 drawings, 1,511 prints, 74 rings, 27 art subjects, 13,596 books. In 1870, by William Gibbs, Esq., Roman and Anglo-Saxon ornaments and other antiquities, chiefly found in Kent. In 1870, by John Meeson Parsons, Esq., a collection of 92 oil, and 47 water-colour paintings. In 1871, by W. Smith, Esq., 86 early English water-colour drawings. In 1874, by Alexander Barker, Esq., Venetian furniture of a boudoir. In 1876, by John Forster, Esq., 48 oil paintings, 74 frames of water-colour paintings and drawings, collections of drawings, sketches, and engravings, collection of manuscripts and autographs, library of printed and illustrated books. In 1876, by Sir Matthew Digby and Lady Wyatt, 148 fans. In 1876, by William Smith, Esq., 136 water-colour drawings, and about 700 volumes of books and MSS. See also his gift in 1871. In 1877, by the Shah of Persia, a collection of Persian carpets and textiles. In 1878, by the French Minister of Commerce, specimens of Gobelins and Beauvais tapestries. In 1882, by Mr. John Jones, a magnificent collection of works of art, chiefly French furniture, porcelain, and enamels of the eighteenth century.

The art collections at the South Kensington Museum thus formed are comprised under the following heads: (a) Objects of ornamental art generally (originals and reproductions); (b) British paintings in oil and water-colours, &c.; (c) British sculpture; (d) gallery of casts of Classic sculpture; (e) national art library of works on fine art, drawings, engravings, photographs, &c., and are available not only for the central museum and library of reference, but also for circulation throughout the country. The system of circulating objects of art (originals and reproductions) was revised by minute of March 29, 1860, and a report upon this function of the Science and Art Department was published in a Parliamentary paper in 1881.

In 1865, Her Majesty the Queen graciously lent the Raphael cartoons for exhibition at the South Kensington Museum.

In 1857 arrangements were made for lighting the Museum and throwing it open to the public on three evenings a week, and since that time, up to the end of 1882, 21,582,102 persons have visited the Museum. From 1856 to 1883 the amount voted for the purchase of objects of art (originals and reproductions), available both for the central Museum and for circulation in the provinces, has been 328,099/. That for purchases for the National Art Library has been 49,150/. The value of the bequests far exceeds the sum total expended.

The Department of Science and Art was constituted by royal charter dated April 30, 1864, a body corporate, since which time it has accepted numerous and valuable bequests of works of art.

The establishment of the branch museum of science and art at Bethnal Green arose out of two circumstances. The first was an intimation on the part of the inhabitants of the East End of London of their willingness to provide a site for such a museum if the Government would organise it. The second was the necessity for removing the larger part of the iron buildings at South Kensington to make room for permanent structures. The materials of the iron museum were thus available for re-erection elsewhere. The Treasury approved of the general proposal to use these materials in the formation of district museums. The branch museum at Bethnal Green was to be a national institution for the reception of objects of science and art being national property which are insufficiently provided for elsewhere. There were "one or more classes of objects in the South Kensington Museum which would appropriately constitute the foundation of such a museum, such as the collection of animal products useful in manufactures." The site was transferred by the inhabitants of the East End of London to the Government in February 1869, and the buildings which had been erected by a Parliamentary grant were completed early in 1872. The animal products and food collection were removed from South Kensington, and the artistic division of the new branch museum was for the time composed of pictures and works of art lent by Sir Richard Wallace. The branch museum

of science and art thus formed was opened by their Royal Highnesses the Prince and Princess of Wales on June 25, 1872. The science section of the museum has maintained its permanent character, but the artistic collections have been changed several times, various and important contributions on loan having been made by private persons. For some time the ironwork from the Kensington art collections was exhibited at the branch museum. Within the last three years all the specimens which illustrate modern phases of ornamental art have been eliminated from the art collections at South Kensington and placed in the branch museum. Up to the end of 1882, 6,428,479 persons had visited the branch museum.

The staff of the South Kensington Museum, including the Bethnal Green Branch Museum, the India Museum, and the Art and Educational Libraries, consists of a director, two museum superintendents, three museum keepers, ten assistant museum keepers, eight junior assistants, and nine technical and special assistants.

## THE WELLINGTON MONUMENT IN ST. PAUL'S.

A LETTER has appeared from Mr. Edmund Oldfield, a member of the St. Paul's Committee, in defence of the original design by Stevens, which had an equestrian statue surmounting the monument.

In sepulchral memorials, says Mr. Oldfield, two periods were often meant by the artist to be embraced in one composition, to make the history of the deceased, however great, more complete by the juxtaposition of life and death. This was not really illogical. Even upon the narrowest interpretation of the Aristotelian canon, unity in a drama is not impaired by variety of time, provided the singleness of subject is preserved. So with the arts of design. The painters of the Middle Ages, in their histories of saints, brought together several dates in the same fresco or panel, yet without raising any sense of discord. The more restricted conditions of monumental sculpture have usually confined the dates, in the case of effigies, though not in the case of reliefs, to two. As a general rule, the figure surmounting a sepulchral monument was in old times represented alive, whether or not the corpse was also represented below. The mausoleum of Halicarnassus had on its summit the statue of the king driving a *quadriga*. The cinerary urns of the Etruscans were crowned with figures of the deceased reclining on their left elbows, with drinking horns, cups, or other symbols of life in their right hands, though often the sides of the urns bore representations of the same persons in death, as may be seen in abundance in the Museum of Volterra. The sarcophagi of the Romans were equally surmounted by effigies of persons apparently alive. In the Middle Ages we have an exact Gothic counterpart to the supposed anomaly of Stevens's design. The monument of Can Grande at Verona shows the "Gran Lombardo," the protector and friend of Dante, lying dead upon his sarcophagus, while the architectural canopy above bears his statue on horseback, though necessarily of smaller dimensions. The other monuments of the Scaliger family in the same burial-ground repeat the double representation. By an exceptional treatment the statue of Robert the Wise is four times introduced on his tomb in Santa Chira, at Naples—once in a recumbent form, attired as a monk, on the sarcophagus; once seated above on his throne as king; and twice elsewhere in combination with other figures. In the cinquecento period, to which Stevens's design by its style belongs, the same practice continued. Take the royal monuments of St. Denis, which, though grievously restored and modernised, still show the conceptions of the greatest artists of France. The tomb of Louis XII. and Anne of Brittany, sculptured by Jean Juste, displays the royal pair lying dead on a sarcophagus, while on the canopy overhead their statues reappear, kneeling in prayer. Similar is the treatment in the sumptuous monuments of Francis I. and Claude of France, designed by De l'Orme, and executed by several sculptors; and again in that of Henri II. and Catherine de Medici, designed by Primaticcio, and sculptured either by Germain Pilon or Pierre Bontemps. Possibly these Valois kings might have looked more at home on horseback than on their knees, especially the last named, who died in the saddle, and not at the *prie-dieu*; but such was not the feeling of the pious artists, some of them Huguenots, who sought (in vain, alas!) to commend them to the respect of posterity. The horseman "riding into the cathedral on the top of his own monument" is not, however, wanting from this school. By an easy transition, we pass from Henri II. to the husband of Diana of Poitiers, Louis de Brézé, whose gorgeous tomb, attributed to Jean Goujon, may be seen in Rouen Cathedral. The equestrian figure of the deceased here appears under an arcade above, while his corpse, lamented by his *fidissima conjux*, as she describes herself in the epitaph, lies stretched on a sarcophagus below. Regard for space restrains me from offering further illustrations; but what I have written may sufficiently show that the double representation, however startling, perhaps, at first sight, is neither without meaning nor without authority.

## NOTES AND COMMENTS.

THE people of Brisbane who invited English architects to compete for a new town hall, did not anticipate that a great number would take an interest in the competition. Accordingly, only three or four copies of the particulars and instructions were remitted to the London agents. In a short time the supply was exhausted. The agents expected that the copies which they had sent out would be returned to them, and become available for the use of the new applicants. But it was absurd to suppose that so small a number would be sufficient. Architects who now inquire for the conditions of the competition are told that there is no chance of obtaining the information. Instructions should have been given to the agents to print copies in England. At present no more than a very few architects are in a position to take part in the competition. When the circumstances are known in Brisbane, we suppose arrangements will be made to send a fresh supply of conditions to England, and of course the time for sending designs will have to be extended.

At a time when some of the authorities of the suburbs of the metropolis have been invoking the aid of the Home Secretary to enable them to obtain supplies of water independently of the water companies, it is not encouraging to find that there is a dangerous scarcity of water in Richmond, although the source supply belongs to the vestry. A sum of about 60,000*l.* has been expended on an artesian well, but it does not appear to be equal to the demand upon it. Artesian wells are proverbially uncertain, and so long as a town depends entirely upon one there must be empty cisterns occasionally. The passage of the water to the well is beyond human control, and the supply may be affected by causes which are unknown. Yet there are enthusiasts who, if they had the power, would make the metropolis, with its four millions of inhabitants, dependent upon the intermittent supplies of artesian wells. In Northampton there is also a difficulty in obtaining a sufficient supply of water. As the population of towns increases, deficiency of water is likely to be heard of more often than it has been. There is no want of gathering grounds for supplies, but until they are appropriated according to the general interests of the community, instead of being monopolised as they now are, some towns must periodically endure water famine.

THE meeting of the British Archæological Association at Dover during the week has been successful, although Earl GRANVILLE, who was the president for the occasion, was unable to be present. The town, as everyone knows, contains much that is interesting to the archæologist—more, in fact, than was visited by the members. One modern piece of work attracted attention—the new town hall—which was designed by Mr. BURGESS, but unhappily he did not live to complete it. Among the places in the neighbourhood which have been visited are the Priory of St. Martin's (part of which was restored by Mr. STREET), Richborough, Sandwich, Lyminge, Hythe, and Caesar's Camp, near Folkestone. Some interesting papers were read at the evening meetings. The Association held its first meeting at Canterbury in 1844, and its history since that time was narrated by Mr. THOMAS MORGAN. The samphire plant, which is mentioned in "King Lear" as being found at Dover, was not forgotten. The charters, regalia, seals, silver oar, and other valuables belonging to the Dover Corporation, were exhibited in the Town Hall.

ABOUT six months ago some important alterations were commenced at the Louvre, with a view to increasing the available space of the French national museum. The heavier portions of this work are now sufficiently completed to allow of the decoration and fitting up of the two new galleries being taken in hand. One of these is intended to receive the collection bequeathed to the nation by M. THIERS, while the other will form a much-needed extension of the painting section. This latter gallery will, moreover, present a double novelty, both from the highly original and artistic character of its decoration and from the remarkable nature of its contents, which will include many of the finest works of sculpture as well as painting in the possession of the Louvre. It will, in fact, be a representative gallery. Much is expected from this

method of arrangement, which is an entire innovation, the two sections of painting and sculpture having always hitherto been kept separate in French museums. The new gallery, situated on the river side of the palace, and forming a long parallelogram, has hitherto been used as a storehouse or lumber-room, its only available light being obtained from bull's-eye windows in the spring of the vaulted roof. There is now an iron and glass roof, the top of which can be seen from the Pont Royal, rising several yards above the surrounding roofs of the building.

THE Italian Government have at last been persuaded that it would be an advantage to have a National Gallery in Rome. A decree for its foundation has been issued. But the gallery is to be representative only of the works of living artists or of artists who have died within a recent period. It is to contain the "best works in painting, sculpture, design, and engraving, without distinction of kind or manner." The Minister of Public Instruction is to give the commissions for the works which are to be hung in the gallery. The works will be selected from public exhibitions, and in some cases purchased from the studios. Nine-tenths of the money will be appropriated to works by living artists, and the remainder to the purchase of works of artists who have died within a period of thirty years.

THE wood of the cherry tree is said to be becoming fashionable in the United States of America for furniture and the fittings of rooms. A banking-house is said to be finished entirely of the wood, which is left unvarnished. The timber is chosen from the wild cherry, which in New England and the Northern States does not usually grow to a girth of more than 20 inches, but in some of the Western States and in the South it frequently attains a diameter of 24 inches. The domestic fruit cherry gives some good specimens of small timber, but as the tree is rarely sacrificed until it is past bearing and is decayed, this source of supply is precarious. Like all close-grained timber, the best specimens are those which grow singly in exposed situations and not in a dense forest.

THE Louvre has just received an interesting collection of antique terra-cottas from Myrina, in Ancient Mysia (Asia Minor), where they have been unearthed by the peasantry of the country. The most remarkable is a large figure of a dancer in a perfect state of preservation. The others appear for the most part to be imitations of Tanagra figures, the Greek type being followed even to the addition of the slender plinth, whereas purely Asiatic productions of this kind are almost invariably raised on pedestals. One of the largest of these terra-cotta figures represents a nude VENUS standing near a vase, signed on the reverse. At Epidaurus, where the pupils of the French School at Athens are excavating, they have brought to light the remains of a Doric temple. Among the ruins were discovered ten lions' heads, that had evidently been used like gargoyles; two headless statues of ESCULAPIUS, one of HYGIEIA, an ex-voto and fragments of a Centauromachia. The Société Française du Laurium has, moreover, discovered twenty-nine vases of primitive style, which have been placed in the hall of the society.

IF what is said by the *New York World* be true, there is no doubt that the city of New York stands as much in need of a sanitary revolution as any town in benighted Europe. The tenements that extend for miles on the east side of the city are in a deplorable condition. Most of these structures were built to house as many people as possible, and with no more light and air than was absolutely necessary. The result is that thousands of people are crowded into dark and ill-ventilated holes. They are choked, worried, consumed, and the astonishing spectacle is presented on a sultry night in these streets of the entire population seeking the sidewalks for air and comfort. Sanitary inspection, the *World* believes, has done very little to abate this evil, and it is doubtful if ever will do much until the boundaries of New York are carried into the broad spaces of what are now the suburbs, and an enlightened public opinion insists upon improved tenements for the poor.

A DOCTOR'S RESIDENCE AT BINFIELD BERKS.

CHAS. SMITH & SON ARCHTS. READING 1883

## ILLUSTRATIONS.

VIEW IN WINCHESTER.

THIS reproduction of a water-colour drawing by Mr. BARRAUD shows one of the oldest streets in Winchester. It is, we believe, in contemplation to remove some of the buildings under a towns improvement scheme.

A DOCTOR'S RESIDENCE AT BINFIELD, BERKS.

WE illustrate this week a house recently erected in the favourite residential locality of Binfield, Berks, for Mr. JOHN SWINDALE. The planning of this building has been specially arranged for a country surgeon, the patients' entrance and waiting-room being kept well apart, both from the principal and servants' entrances, the consulting-room, however, having access from the hall. The house and stables, externally, have the lower portions faced with red brick from the locality, relieved by grey panels, &c., with tile hanging and half-timber work above, the roof being covered with brown tiles. The works have been well carried out by Mr. EDWARD MAY, builder, of Bracknell, Berks, from the designs and under the superintendence of Messrs. CHAS. SMITH & SON, architects, Reading.

A COUNTRY RESIDENCE.

THIS house is to be executed in red local hand-made bricks, with Bath stone dressings. The half-timber work is of oak, left rough from the saw, the roofs being covered with Broseley tiles. The internal woodwork is of pitch pine. The architect is Mr. C. S. SMITH, of the firm of Messrs. CHAS. SMITH & SON, architects, Reading.

STUDIES FROM THE LIVING MODEL.

THESE studies are from originals drawn with a pen by M. PAUL BAUDRY, the French painter.

## LANCASHIRE AND CHESHIRE ANTIQUARIAN SOCIETY.

A MEETING of the Lancashire and Cheshire Antiquarian Society was held at Preston on last Saturday, when several places of interest were visited, under the guidance of Mr. Charles Hardwick, author of the "History of Preston." The first was the picturesque mansion of Penwortham Priory, the seat of Mr. Lawrence Rawsthorne, who showed his guests the interesting remains of old work that are embedded in the more modern structure. One of these antique features is a very large ingle-nook, with a beam of extraordinary proportions. From the high road a finely-wooded avenue leads to the church where Mr. John Horrocks, the founder of the cotton industry of Preston, and many other local notables are buried. Close by is a large artificial mound known as "Castle Hill." Mr. Hardwick here gave a short address on the result of the excavations in 1856, and which had revealed the existence of an antique dwelling-place, apparently one of the rattle and daub houses formerly common. A Roman key of somewhat late make, numerous animal remains, and a fine spur were amongst the articles discovered in the debris. Mr. Thorner conjectured that the building had been the court-house or tribunal of the baron of Penwortham. The site of the Roman station of Walton-le-Dale was next visited. It is now covered with gardens, and little or no trace is visible of its former condition. The next point of interest was the museum, where the Rev. Jonathan Shortt explained the archaeological objects of local interest. These include a small selection from the great find of coins made at Cuerdale, and about 400 Roman coins discovered many years ago near Fleetwood, and recently presented to the museum by Dr. Browne. A number of relics of Samian ware and other pottery from the Walton station were also shown. In the same building is the library bequeathed to the town by Dr. Richard Shepherd, an interesting collection strongest in the medical and general literature of the latter part of the seventeenth and first part of the eighteenth century, but including some fine specimens of the printing of Bodoni and other *notabilia*. Another object of attraction was the oak-panelled room in which Sir Richard Arkwright is said to have first set up the machines that were destined to have so great an influence upon the fortunes of his country and the world at large. The old cockpit and the site of the bull-stake were also seen. The various localities connected with the Stanleys and with the Stuart rebellion also attracted the attention of the visitors. In the evening a meeting was held at the Victoria Hotel. Sir Thomas Baker, in taking the chair, expressed his satisfaction with the work of the Society, and said that after seeing how few were the remains of the station at Walton, he should feel more satisfaction in think-

ing of the safe preservation of the fragment that still remained of Roman Manchester. It was greatly to be desired that archaeological objects when found should be carefully described, labelled, catalogued, and, where possible, placed in some public museum. Mr. Charles Hardwick then read a paper on the Roman remains found at a place known as the Plump, and traditionally said to be the burial-place of the warriors of the Duke of Hamilton slain by Cromwell in the fierce fight when "Darwen's stream with blood of Scots imbued" was celebrated by Milton. A "Scotch penny," found by some labourers, proved to be a first brass of Domitian, and excavation brought to light a variety of pottery, coins, and other evidences of Roman occupation. The discovery of this hitherto-unknown station had proved to be a matter of great importance for the right understanding of the history of Lancashire in that early period. Mr. Georges Esdaile read some notes on the Priory of Penwortham and its connection with the great Abbey of Evesham, of which it was a dependency. In the conversation that followed, Rev. G. W. Reynolds, Mr. J. E. Bailey, and others joined, and the proceedings closed with votes of thanks to Mr. Rawsthorne for permission to visit the priory, and to other gentlemen who had aided in the carrying out of the programme of the day.

## MANCHESTER ART GALLERY.

THE Art Gallery Committee are now engaged, says the *Manchester Guardian*, in the arduous task of hanging the works selected out of more than 3,000 sent by artists for the forthcoming exhibition. In this important labour they have the professional superintendence of Mr. Val. C. Prinsep, A.R.A., who has kindly given his assistance to the Corporation. Some idea of the extent and attractiveness of the exhibition may be gained from the fact that the contributions include works by Sir F. Leighton, P.R.A., Millais, Holl, Briton Riviere, T. Faed, Yeames, Herkomer, Alma Tadema, Pettie, G. F. Watts, Phil Morris, MacWhirter, Prinsep, Ansdell, Crofts, Storey, Calderon, Leslie, Poynter, and other academicians. Of the usual contributors to the Grosvenor Gallery, Burne Jones, Whistler, and Holman Hunt are represented by important works; and Madox Brown, John Collier, Waterlow, Mrs. Jopling, Charlton, Basil Bradley, Holloway, Leslie Thomson, Logsdail, and most of the prominent outsiders send pictures. Amongst the foreign artists exhibiting may be mentioned Fantin, De Neuville, Vibert, and Giardi. Amongst local painters Partington, Percy, Somerset, Hague, Sheffield, Jackson, Slater, Bright Morris, Joseph Knight, and J. Armstrong may be mentioned as important contributors. A beautiful series of pictures of childhood has been sent by the Fine Art Society, and a very interesting series of paintings illustrating animal life by the proprietors of the *Graphic*. Altogether it is not too much to say that a more thoroughly representative exhibition of the fine art of the day has never been collected together than that which will be opened on the 31st instant by Lord Carlingsford.

## LANERCOST PRIORY, CUMBERLAND.

AN address was delivered at Lanercost to a local society, by Mr. H. J. Bulkeley, upon the ruins of the Priory and Picts' Wall. In the course of it he said:—

Who of you, if he possesses any sense of natural beauty or any historical imagination, can look at that ridge of hills without thinking of the Roman Wall that topped it, so that anyone walking along the opposite side of the valley could have seen its long grey outline surmounted by ever-moving soldiers cutting themselves out against the northern sky? There in wind and calm, and sunshine and snowstorm, those armed soldiers—some perhaps of the century of Cassius Priscus (whose name is to be seen on the Lanercost cloister garth), some of them brought right away from the sunny south to this cold land—ever, ever paced, ready to call their comrades from mile castle or station, should the savage Picts be seen creeping up through the hills from Bewcastle to make one more fruitless attempt to break through that barrier of stone and steel. So strongly built, such a solid mass from front to back, as indeed from end to end, it must have seemed as though it would have stood for ever. You may see on Hare Hill how strongly cohesive even the inner work was, and is, for it stands there, nine or ten feet high, as it has stood for many a year, crowned with bushes and polypody fern, though the facings of harder-worked stone have been completely torn away. And most of it would have stood well into our time unless man had not been much more destructive than wind and rain, and burrowing rabbit, and insinuating roots of hazel and blackthorn, of ash and oak. Look northwards when you cut the wall on the road between here and Walton, and you will see the line of the ditch climbing up Craggle Hill more clearly at one glance than from any other point of view about here. But, as your eye rises with the ground, you will observe one farm, Haytongate, built right across the ditch, and another, Randylands, just on its counterscarp. Whence came the stones of which these farmhouses, or their predecessors, were built? From the departure of the Romans until almost to-day the

wall has been a great quarry for the country through which it has passed. And yet so massive was it, and for the most part in such a thinly-inhabited district, that the ruin must have been very gradual. For a long time Byron's lines about the Colosseum could almost word for word have been used of the Picts' Wall :—

A ruin—yet what ruin! From its mass  
Walls, palaces, half cities have been reared.  
Yet oft the enormous skeleton ye pass,  
And marvel where the spoil could have appeared.  
Hath it indeed been plundered, or but cleared?

If for "palaces" we must in all modesty substitute farmhouses, we might add, as indeed Byron could have added, churches. There must be few spots in Cumberland where from the bottom of a valley, in a sparsely-populated district, three churches can be seen at once. Yet this is the case at the north end of this bridge. Nether Denton Church, about capping Irthing valley, as seen hence, and Walton Church, in some degree an architectural daughter of the abbey, crowning the east bank of King, are very recent erections, and neither Mr. Ferguson nor Mr. Paley would be likely to allow the stones of which they were built to be stolen from the wall. But far different was the conduct of those Austin canons or De Vallibus lords who built the third, the Priory Church of St. Mary of Lanercost. The inscribed stone in the cloister garth, the altar—so insisted on by Dr. Bruce at the recent visit of the Archaeological Institute—that is built into the roof of the chancel clerestory are not the only evidences of the way in which Roman relics were used by these practical monks. The square-headed stones, which can be seen in the abbey itself and in the surrounding walls, by their shape and working prove their origin and show that the whiter stones of the abbey, one feature of its varied beauty, were taken from the Roman Wall, or perhaps from some intra-mural station at Lanercost, the road to which passed over the Roman bridge. Let us look at the abbey from another point of view. The bridge on which we stand was some centuries off being built; most likely the old Roman bridge had fallen into ruins, and it was through a ford that, on Michaelmas Day, 1306, in a litter carried by horses, Edward I. arrived here, sick in body but still strong in mind, perhaps our greatest English king. Fancy Edward Longshanks having passed with his retinue through this very stream, having been received by the prior with all state at the porter's lodge, having lived and slept, as well as he could, for six months (by tradition) in the pele tower that now forms part of the vicarage, leaving it at last to do little else but suppose that he was better, as a sign hang up his litter in Carlisle Cathedral, and then ride slowly and painfully to Burgh-on-Sands to die. Such is the most notable historical memory of Lanercost, one of which such a humble priory might well be, and no doubt was, proud. But Irthing saw another sight when, in 1311, lead by the Bruce himself, and in 1346, the Scots burst through its fords, or over its northern range of hills, and sparing only the church, reduced buildings and community almost "to nothing." Perhaps some of them were never rebuilt. Or, if they were, they, or those parts not used as the Dacre dwelling-house, fell into rapid or gradual ruin after the suppression of the priory by Henry VIII. But how is it that so much of the church remains? If we remember, as has been recently discovered from Chancellor Waugh's interleaved copy of Bishop Nicholson's visitation notes that, for no doubt a considerable, though uncertain, period between 1536 and 1730 the parish church was just the north aisle, and that the nave, too, was open to the sky, and, so far in ruins, it is with increased wonder that we see the whole church, in its beautiful proportions, almost whole to the top of the walls, so that, with the aid of a few planks at the north-east corner of the north transept, the clerestory all round the church is perfectly sound. Well, there would seem to be two historical reasons for our still having our grand priory church, its shell almost as complete, and at least as charming in its weather-tanned old age, as when it came fresh from the hands of the original builders. One is, that the Roman Wall was such a good quarry close at hand, the other that the conventual buildings were granted to Sir Thomas Dacre, who would feel an ancestral pride in taking some care of the church that was associated with the names of Vallibus, Multon, and Dacre. And when it passed from the Dacres of Lanercost to the Crown it was in safe keeping as compared with what some private proprietors might have been. And now that the Howards own it, we know that it could not be in more careful hands. Perhaps some of you may think that the picturesqueness of the ruins has been lessened this year by the small trees and brushwood having been cut down that here and there sprang from the tops and sides of the old walls. Byron said, also of the Colosseum—

the low night breeze waves along the air  
The garland forest which the grey walls wear.

And I remember when I was in Rome, eleven winters ago, how the sub-rector of the English College of Jesuits indignantly denounced the Italian Government as "Goths" because all the green was being stripped from the walls of the great Flavian Amphitheatre. But this, no doubt in some ways, beauty-destroying work had to be done, though with regret, both at Rome and

Lanercost, for roots, when they get well into a wall and grow and force the stones apart, and a strong wind sways their branches, exert a leverage which at last even the firmest masonry can hardly resist. If you want to see how a root can grip, look at a big stone on the rockery at the vicarage, how it is held inextricably by the red gums and fangs of an old yew lately uprooted from the west side of the crypt. Human beings are not the only animals that take an interest in the Lanercost ruins. For them it is made more beautiful not only by the green growth that still clings to its walls, but by the many birds that there find nesting and roosting and hunting places. One year some hawks built in the old tower. There the barn owl flits about noiselessly in the gloom, except for an occasional whistling scream, or sits for hours teaching its young for some good reason to make a noise like knives being ground; and occasionally one catches a sight of that very shy bird the misnamed goatsucker, or nightjar; and earlier in the evening it is a famous prey- and play-ground for the swifts who rush just over the old buildings, sometimes a dozen together, making the air tremulous with the beat of their wings, and their chorus of peculiar shrill cries. But the prominent bird is the jackdaw. As a rule he keeps his distance, but the cold weather makes him daring, and he robs the little birds of the crumbs thrown out by the children, and one day last March stole all my pyrocanthus berries. One pair build every year at the back of the head of the figure of Mary Magdalene, and scatter sticks about in front of the west door, for they are not economical builders. Now they are off with their young for a holiday on the fells, but it is said that they send messengers every day to see if the old home is still standing. No doubt you have noticed the two recent inscriptions on the bridge about it being unsafe for traction engines. In our thirst for archæology let us not despise modern history. Those inscriptions, though but a few years old, are a historical fact of much interest to the lover of the picturesque, for it lives in the memory of not the oldest inhabitant that over this graceful bridge, almost a packhorse bridge in its lightness, two by no means graceful steam engines, with biblical names, "Cain," in this instance, being assisted in his murderous attempt by "Abel," once passed, and so shook the bridge in their passage, the south arch being evidently depressed from its true curve, that very rightly they and all their kin are warned not to commit the like offence. Two years ago I brought an artist friend to this spot with a large canvas and got him to paint the bridge from this point, hoping to see the picture in the Royal Academy. But when he got back to London some very wise cockney critic persuaded him that the picture was spoilt by—what do you suppose?—the bridge, forsooth. And so my friend painted out the bridge and substituted, who cares what, and sold the picture at any rate.

### SOME EARLY BUILDINGS IN SUSSEX AND SURREY.

DR. E. A. FREEMAN has contributed the following interesting paper to the *Guardian*: The necessity of combining strictly historical with purely architectural study never comes out more strongly than in dealing with the English buildings of the eleventh century. Their history is very simple, and it has been set forth over and over again; but such is the working of a confused nomenclature, and a generally confused way of looking at things, that it needs to be set forth afresh every time any building of the class, or of any kindred class, is seen or spoken of. As long as people go on asking, in Yorkshire no less than in Surrey, "Is this Saxon?" there is no means of answering them in monosyllables. It might be in vain to ask back again how in Anglian Yorkshire a building of any date could be "Saxon," or how, in the South-Saxon land, a building of any date since 491 could be other than "Saxon." What is really meant commonly is, "Is this building older than 1066?" And to that the answer in many cases must be, "I do not know, and it does not much matter." Nothing is more certain than that many of the so-called "Saxon" buildings are later than 1066; but they are none the less (like King Boso) "id quod sunt;" they are none the less what people mean, so far as they mean anything, by calling them "Saxon." That is, they belong to a style which was in use when King William came into England, which did not at once come to an end when King William came into England, but which did from that time, or more truly, from a time a few years earlier, gradually die out and give way to another style. But to talk of this style as "Saxon," meaning by "Saxon" "English older than 1066," does nothing but lead to confusions of every kind. To tell the tale again for the thousand and first time, for several centuries before the eleventh, all Western Europe built in one variety of Romanesque architecture. In Gaul and Britain this style gave way in the course of the eleventh century to various local forms, as Norman and Provençal. The Norman variety was brought into England under Edward the Confessor; it became established in the course of the second half of the century; and all the greatest churches were rebuilt in it. But the elder style had some slight influence on the newer, and it continued for a good while to be used alongside

of it, especially its church-towers. In Germany, on the other hand, the elder style lived on through the twelfth century; it improved and developed, but it did not give way to any other styles till the coming of the Gothic forms in the thirteenth. We have thus a form of Romanesque quite distinct from Norman, older than Norman, but which lived on alongside of Norman. In this style great buildings were still built in Germany in the twelfth century. In England little, if anything, was built in it after the end of the eleventh; and, owing to the rebuilding of all the great churches after the Norman Conquest, all the English examples of the style belong to small and commonly rude buildings.

All this is perfectly clear to anyone who understands the architectural and the general history of Britain, Gaul, Germany, and Italy. But to talk of such a style as "Saxon" confuses the whole story. It is open to all the general objections against using that word *chronologically*, and to some special objections of its own. The style is in no way peculiar to the Saxon lands of Germany and Britain. It belongs no less to Northern England, to Southern Germany, to Lombardy, Burgundy, and Aquitaine. In short, unlike the latter local form of Romanesque, it is common to all Western Europe. The "Saxon towers" of England are simply small and rude examples of the same type as the great *campanili* of Italy.

One of the most remarkable of these buildings, the tower of Sompting church in Sussex, was visited at the late meeting of the Archaeological Institute at Lewes. Two others, one of them quite as remarkable, the churches of Bosham and Worth, were not, and could not well be visited. In the same county there is work of the same kind at Woolbeding, near Midhurst; and, to cross the borders into another kingdom and diocese, there is a most remarkable example in St. Mary's church at Guildford. A few words on some of these buildings, coming after the Lewes meeting, may not be out of place. One eye at the Lewes meeting, that of the local reporter, who spoke of the "Rhine-like spire," seems to have taken in what he was looking at. We hope that so observant an eye may some day have more distant practice at Romainmotier and at St. Aventin.

Sompting tower is the only one of the class in England which keeps its original capping, a kind of diagonal, four-sided spire, rising from four gables. It would be rash to say that all the towers of the class were finished in the same way; but some others certainly seem to show signs of it, and the finish is common in Germany. This is doubtless what the reporter chiefly meant by the "Rhine-like spire"; but we may give him credit for feeling, if not for knowing, that the whole class, rare in England, is common in Germany, even if he had not gone on to the further fact that towers of this kind went on a hundred years later in Germany than they did in England. No record of the building of Sompting tower seems to be preserved; it would be nothing startling if it could be proved to be not only later than 1066, but actually a work of the twelfth century. The Lincoln towers were built between 1068 and 1085; some of their neighbours in Lindsey seem from their details to be later still, and we must not forget that traces of the earlier style have affected even the Norman west front of Tewkesbury, which cannot be earlier than 1103, and may be as late as 1123. In all this there is nothing wonderful, if we remember that we are not simply fixing dates, but tracing the history of a style of art. Men went on building in English fashion as they went on speaking in English fashion, though other men were building and speaking in Norman fashion alongside of them. It would be dangerous to guess any date for the tower of Sompting; but should it turn out to be of the date even of Henry I., we should accept the discovery with the same kind of feeling with which we greet a good English name in that King's pipe-roll and in other documents far later still.

Sompting tower has some peculiarities of its own, besides the unique effect given to it by its covering. Its long-and-short work, as Rickman saw long ago, is unlike other long-and-short work. It has coupled windows with mid-wall shafts; but they do not go all round the tower, and they have a character altogether their own. Both the windows and some other details of the tower forsake the usual hardness and squareness of the style. They show a fondness for a round surface instead of a square, a tendency which the style often shows in its larger arches, but not often in these small features. Thus in the upper part of the tower the pilaster strips change into slender shafts with capitals, such as are common in German and Italian apses. Of the capitals some are quasi-Corinthian, some quasi-Ionic, but not at all like the familiar Norman variety of Ionic. So we get an ornamental string round the tower, but it has not any of the common Norman ornaments. Within, the tower arch is rich and stately; it is of far more finished work than is usual in our Primitive Romanesque, but it shows one of the marked features of the style. Instead of the many orders, with or without nook shafts, of the Norman style, there is the single half-column set against a flat surface, and that, as in some other cases, continued as a heavy roll along the arch. This, again, connects the Early Romanesque of England with that of Ireland, and, it would be safe to add, of Wales. It was very seldom that—perhaps only in the single case of St. Woollos—the English, British, or Irish builder of a doorway or a chancel or tower arch found Roman columns ready to his hand. But he liked

to come as near to Roman models as he could. A flat surface and something as much like a column or half-column as he could get was what he sought after; the Norman type was not to his taste, unless haply in the chancel arch at Bosham.

The rest of the church at Sompting, even without the tower, is remarkable in many things. For one thing, it is very South-Saxon in its arrangements. But it is of the early features that we have to talk, and the tower arch at Sompting easily carries us to the chancel arch at Worth. Here we have no Primitive tower, but we have a Primitive church unaltered in its ground plan, except by the addition of a modern side tower. The church was described some years back by Mr. W. S. Walford, in the *Sussex Archaeological Collections*. Since then a "restoration," while making some foolish innovations, has brought to light some ancient features which Mr. Walford could not have seen. The church was, and still remains, a cross church without aisles and with an apse to the chancel. There was no western or central tower; but a tower had, at some time or other, grown over the north transept, producing that effect of an imperfect Exeter, Ottery, or Geneva, which is to be seen at Somerton and some other churches in Somerset. After the little church at Bradford-on-Avon, the church at Worth comes nearer than any other to a perfect example of an English church of this Primitive Romanesque style. It is the only one in which we can judge of something like its general effect on a greater scale than that of Ealdhelm's *ecclesiola*. And it is wonderful what true dignity there is about its simple and massive forms. We suppose we must call the work at Worth rude, which we can hardly call that at Sompting; at any rate, it is much plainer. The ground-plan of the church gives us three considerable arches; those of the transepts, lower and narrower, are perfectly square and plain; the chancel arch, wide and lofty, has a huge half-column, with a very heavy abacus very plain, with none of the volutes and foliage of Sompting. Nor are we without doorways and windows to match; the "restoration," whatever else it has done, has brought both to light. There is a tall, narrow, very square-edged doorway on each side, and three windows, two on the north, one on the south, which made one hardly believe one's eyes. They are coupled windows with a central baluster, very plain and heavy. They have been touched up more than enough during the "restoration," but the forms have clearly been kept, and one window seems hardly to have been meddled with at all. This form is what we look for in a belfry window or in a triforium, where the opening has not to be glazed; it seems strange as an ordinary window. They are now glazed, and the effect is very odd; anciently they were doubtless closed by shutters. Strange as they seem, these are identical with a long train of Italian examples—from windows of their own type in St. Stephen's at Verona onwards—where windows are divided by a shaft, and the glass made somehow independent of the window. Plain Englishmen may prefer a mullion, an institution devised for the express purpose of holding the glass in the window; but Ruskinian fashion seems against them. Here, to be sure, we see Englishmen, and doubtless very plain Englishmen, doing the same thing ages back; but then, when Worth church was built, mullions had not been invented. But anyhow the stateliness of the interior of Worth church, with its primitive windows and arches unmixed by later work, is really amazing. For some part of its effect we must in fairness thank the modern restorers. But while we thank them wherever they have brought Primitive work to light, we do not thank them where they have brought in work out of their own heads. The apse had been recast in later times by inserted windows and by clumsy buttresses which hid the pilaster-strips. As these last were not needed for safety—for *solvitur stando*—it was surely right to take them away; it was surely wrong to take away the inserted windows to put in fancy ones. As it is, we have the strips all round, save where the modern tower comes in, all plain and square, rising from a double plinth. The transepts should be noted, as showing the great antiquity of a local South-Saxon feature, to be seen at Sompting and many other places. This is to make something or other east of transepts for the reception of altars, either projecting chapels or mere recesses in the wall. Here at Worth we have the fashion, not of projecting chapels but of recesses, carried up to very early times. How early ages we decline to guess; but Worth looks in everything far earlier, as it certainly is far ruder, than Sompting.

Now Worth carries us on to two churches in the same shire, two of the very smallest size, Woolbeding and Selham. At Woolbeding the nave, without any other Primitive features, has the strips throughout. Selham is doubtless of the twelfth century, and must pass as Norman; but it is Norman of a kind distinctly influenced by earlier forms. The chancel arch, instead of Norman nook-shafts, has a half-column with a very heavy abacus, certainly akin to the chancel-arch at Worth and to the tower-arch at Sompting.

We will end with Guildford. Here below the castle mound with its Norman keep, a Norman keep well worth study, lies the church of St. Mary on the slope of the hill. Here a building of considerable size has gathered in a strange way round a small kernel of the Primitive style. Even outside one can see that the now central tower has strips, though no external Primitive windows.

But it is a chance whether anybody would see them, unless he were put up to look for them. Inside the case becomes clearer. It somewhat reminds us of the way in which the great church of Laval, lately made cathedral, has gathered round an earlier tower. Only at Laval the tower was central from the beginning; at Guildford it was originally western. A nave has grown to the west; the nave of the original church has become the choir; apsidal aisles, well worth notice in themselves, have sprung up on each side of it: the central body, once nave, now choir, has been cut short to the east, and it is said once to have had an apse itself. All this change began very early. A plain Norman arch—the plainest Norman shows its difference from the earlier style—has been cut through the ancient tower on the north and south sides. The strips are cut through; so are two big rude windows, one on each side but not opposite to each other, with the double splay, one of the features of the style which went on in Germany throughout the twelfth century. Whatever the Norman builders designed, they did not build transepts; there is no sign of their eastern walls. In the walls of the present choir are signs of a plain window on each side, and at the point where the choir is cut short there are signs of something else, whether the beginnings of other windows or not is not quite clear. That these are parts of an ancient aisleless nave contemporary with the tower there can be no reasonable doubt. Over the present western arch of the tower there are faint signs of a wide round arch, but the signs are so faint that it is impossible to say whether it belongs to the original work or to the Norman reconstruction. But the latter is far more likely. There could be no motive for so wide an arch in the western face of a western tower.

Here then are four marked examples of a Romanesque style, distinct from Norman, earlier than Norman, though some of its examples are contemporary with Norman buildings. Here is also at Selham a fifth building which shows the way in which the earlier style sometimes influenced the Norman style which succeeded it. In all this there is nothing wonderful to anyone who looks at the matter with a historical eye; but, it will doubtless always be puzzling to those who think that all “the Saxons” lived at one time, and that the short-lived race became extinct in 1066, most likely on the sea-shore at Hastings.

### THE LYON COURT, EDINBURGH.

THE utility of the Lyon Court having been questioned in Parliament, Mr. Grant, the Carrick Pursuivant at Arms, has endeavoured to defend the institution. He says:—

The Lyon King of Arms, as all educated men ought to know, presides over heraldry in Scotland, as Garter King of Arms does in England, and Ulster King of Arms does in Ireland. Whatever fosters the chivalric sentiments of the people elevates their character—and that heraldry is closely associated with such principles every one will, I hope, admit. The insignia of the nation, as well as the heraldic bearings of families, have for many ages been objects of veneration and interest to a large portion of the people. In voting the Supplies a few days ago, certain persons who see everything from a Northampton point of view objected to the small vote for the officers of the Lyon Court. There did not appear to be any one present in the House possessed of sufficient information to explain that this Court is not an expense to the nation, even as a question of pounds, shillings, and pence. The fees obtained for patents of arms and from other sources nearly pay all the expenses, and if to this source of revenue is added the duty paid in Scotland for license to use arms, Government makes a clear profit out of this question of about six thousand pounds a year! I do not grudge the cost of the English or Irish establishments, whatever it may be, and I think that such men as Sir Albert Woods, Garter King of Arms, and Sir Bernard Burke, Ulster King of Arms, are worthy of their dignities and offices. But let me urge that although the Scottish Lyon King is equally entitled with these gentlemen to the dignity of knighthood, no such honour has been conferred upon him. Mr. George Burnett, advocate, has occupied the Scottish office ever since the death of the Earl of Kinnoull, in 1866. He is a man of great literary merit, having edited many works of acknowledged antiquarian value, and particularly the State Papers and Exchequer Rolls of Scotland from the twelfth century. These works are accompanied by elaborate indexes, prefaces, and valuable notes, and form a great many large volumes. Surely his position and services entitle him, equally with his English and Irish brother Kings of Arms, to the dignity of knighthood. May I humbly call the attention of Her Most Gracious Majesty, as the fountain of all honour, to this oversight. It is not only the Lyon King who adds dignity to the Lyon Court—James Lorimer, Lyon Depute, is the distinguished Professor of Public Law in the University of Edinburgh. He is the author of several valuable works on the law of Scotland, and was for a number of years editor of the *North British Review*. It is mainly due to his writings that the constitution of the Universities of Scotland was so altered as enabled them to become capable of representation in Parliament, thus elevating their status and adding to their prosperity. In conclusion, I must not omit to mention Mr.

Robert Riddle Stodart, the Lyon clerk, whose beautiful work, in two folio volumes, “Scots Arms,” is a most valuable contribution to the heraldry of the country.

### THE PROPOSED WAR OFFICE AND ADMIRALTY.

ON Monday in the House of Lords, Lord Stratheden and Campbell asked Her Majesty's Government whether it was intended in the present year to enter upon operations under the Public Offices Site Bill. He thought his question was justified by the extraordinary expense proposed to be incurred under the Bill. Lord Thurlow said, in reply, that the First Commissioner of Works proposed very shortly to invite a competition of architects for the new buildings for the War Office and Admiralty, which were to be erected on the Spring Gardens site; but he was to add that no buildings would be erected or commenced until the next financial year, when a vote for the purpose would be presented to Parliament, and a full opportunity would be given for discussing the vote on its merits. With regard to the Parliament Street site, there was a distinct determination in the Office of Works to widen Parliament Street in the manner proposed. When that site was cleared—and it would probably be some time before that happened—the site would be exclusively devoted to the erection of such buildings as banks, clubs, insurance offices, and other buildings, with a fitting architectural elevation which would have to be approved by the Office of Works as suitable to the surroundings of that neighbourhood. When that was done, there would be ample warning given for the discussion of the subject. Lord Redesdale said that in a short time proposals from architects would be received for the erection of a new War Office and Admiralty on the site already sanctioned, and money would be required for that purpose next session. He confessed he was sorry to hear the conclusion at which the Government had arrived with regard to the widening of Parliament Street. He did not want clubs, banks, and hotels there. Such plans would be extremely injurious in a variety of ways. Now that public offices were in immediate contiguity to Parliament Street, he had hoped that other public offices would be erected, so as to be in the immediate neighbourhood of the Houses of Parliament. The proposal of the Government was an extremely injurious and unfortunate one.

### THE SHAPIRA MANUSCRIPTS.

A FRAGMENT of the manuscripts of a new version of Deuteronomy, the property of Mr. Shapira, has been examined under some difficulty by M. Clermont Ganneau, the French *savant*, and it is declared by him to be a forgery. The following are his conclusions, as expressed in a letter to the *Times*:—

The fragments are the work of a modern forger. This is not the expression of an *à priori* incredulity, a feeling which many scholars must, like me, have experienced at the mere announcement of this wonderful discovery. I am able to show, with the documents before me, how the forger went to work. He took one of those large synagogue rolls of leather containing the Pentateuch, written in the square Hebrew character, and, perhaps, dating back two or three centuries, rolls which Mr. Shapira must be well acquainted with, for he deals in them, and has sold to several of the public libraries of England sundry copies of them, obtained from the existing synagogues of Judea and of Yemen.

The forger then cut off the lower edge of this roll—that which offered him the widest surface. He obtained in this way some narrow strips of leather with an appearance of comparative antiquity, which was still further heightened by the use of the proper chemical agents. On these strips of leather he wrote with ink, making use of the alphabet of the Moabitish stone, and introducing such “various readings” as fancy dictated, the passages from Deuteronomy which have been deciphered and translated by M. Ginsburg, with patience and learning worthy of better employment.

That which put me on the scent was the presence—ascertained by me at first sight—on the fragments of an important detail, of which I had not at first understood the full significance. The lines of Moabitish writing are arranged in the shape of columns, separated by vertical creases in the leather—that is to say, by creases perpendicular to the general direction of the writing. On the right and left of each of these folds I had noticed two vertical straight lines, drawn with a hard point, as guides for the vertical margins, starting from the upper edge of the strip, and extending to the lower edge, which they do not always reach. The Moabitish forger had not paid much attention to these extremely fine lines, which have scratched the leather in an almost invisible but indelible manner, and the lines of Moabitish characters, instead of being confined by this drawing, have no relation to it. Sometimes they pass over the lines, sometimes they rest on the inner sides of

them, both at their beginning and ending. The forger was obviously guided in observing the limits of his space, not by the vertical marginal lines, but by the intermediary creases. If, however, we compare these strips of leather with one of the synagogue rolls of which I spoke just now, the explanation of this mystery will be made plain to us at once.

These rolls consist of large pieces of leather (generally sheepskin) sewn end to end, forming enormous strips, which may be 30 or 40 mètres in length, and with a breadth of 16 centimètres or more.

The text of the Pentateuch, in the square Hebrew characters, is arranged in regular parallel columns containing some fifty lines each. At the top a horizontal margin is left, and at the bottom another horizontal margin, everywhere wider than the upper one, both extending for the entire length of the roll. This lower margin, to take an example, on a roll in the British Museum coming from Jerusalem and bearing the number 1,460, measures eight centimètres in height. The columns of the text separated by intervals, which, in the roll instanced by me by way of comparison, measures about four centimètres, are marked out with the stylus. The horizontal marks along which the square Hebrew characters are brought into line are confined on the right and left by two long vertical lines, traced in the same manner, which for the most part cross the first and the last horizontal line, and jut out into the upper and lower margin. This is not all. Between each column and the next one the leather has a vertical crease, which runs from top to bottom of the roll. It is these ends of the vertical lines drawn with the stylus, and the peculiar creases which divide them which we meet with on the long narrow Moabitish strips whereon the forger has written his Moabitish characters.

There is more yet. I have said that the large pieces of leather of the synagogue rolls were sewn end to end. Now, among the Moabitish strips, I saw at least one where this seam still exists. I need not point out how interesting it would be to examine the character of the thread. Finally, one sees that on the Moabitish strips one of the two edges, either the upper or the lower, is fringed and ragged. It is the original lower edge of the roll which furnished the raw material to the forger. The second edge, on the other hand, is sharply cut with a penknife or scissors; it is the cutting made by the forger immediately under the last line of the square Hebrew characters.

I advise all the impartial scholars who would thoroughly inform themselves as to this gross imposition, and to whom may be permitted an examination which is denied to me (I know not, or rather, I know very well, why), to take the suspected strips, and to lay them against the lower edge of one of the synagogue rolls preserved at the British Museum. The trick will stare them in the face. I will also beg my more favoured fellow-students to be kind enough, in order to throw complete light upon a problem (which is no longer one to me), to make certain important investigations, especially the following:—

- (1) To ascertain whether, by chance, there does not remain on the upper portion of the strips traces of the tails of the square Hebrew letters, especially of the final letters, which, as we know, descend below the normal line.
- (2) To see if the back of the leather does not materially differ in appearance from the face of it; and whether it has not been left in the raw state, as on the synagogue rolls.
- (3) To take the average height of all the strips, in order to obtain from them the greatest height, which will enable us to determine the height of the original margin of the roll (or the rolls) that supplied the forger. I can at once affirm that on this roll the columns of square Hebrew characters were from 10 to 11 centimètres in breadth, and were separated by blank intervals of about  $4\frac{1}{2}$  centimètres in breadth.
- (4) To ascertain the description of leather, and above all of the thread in the seams.

Nothing is more easy than to effect the experimental examination which I suggest. Let there be given me a synagogue roll, two or three centuries old, with permission to cut it up. I engage to procure from it strips in every respect similar to the Moabitish strips, and to transcribe upon them in archaic characters the text of Leviticus, for example, or of Numbers.

### THE LATE DR. JOHN A. SMITH.

ON the 17th inst., Dr. John A. Smith, one of the secretaries of the Scottish Society of Antiquaries, died in Edinburgh. The *Scotsman* says that as an archæologist, Dr. Smith, while possessing a wide knowledge of the whole subject, was acknowledged by persons versed in the science of antiquities, to be the best informed man in the country regarding that branch of the science which deals specially with the remains of extinct animals in Scotland. He was vice-president of the Scottish Society of Antiquaries from 1870 to 1873, as also from 1875 to 1878, and for many years was one of its secretaries—first as the colleague of Dr. Wilson from 1852, then in conjunction with Dr. John Stuart, and latterly as the colleague of Dr. Arthur Mitchell and of Mr. J. R. Findlay. During his long connection with the Society, Dr.

Smith was a frequent contributor to its "Transactions;" indeed for many years no volume appeared without containing something from his pen. The more noteworthy of the papers or notes read by him to the Society related to the discovery of remains of the reindeer, of the great auk, and of the elk, in Scotland; the horn of a rhinoceros, said to have been found in Forfarshire; the skull of a bear, found in a moss in Dumfriesshire; the remains of the raven, found in Linlithgowshire; the origin of our domestic cattle and the wild cattle of Great Britain; copper and bronze anvils, massive silver chains (of which he gave an elaborate description), bronze Celtic armlets, ornamental stone balls and bronze sickles, together with notices of many other "finds" in different parts of Scotland. Dr. Smith was for many years editor of the "Transactions" of the Society, and in that capacity he officiated for a considerable time along with the late David Laing, who was one of his most valued friends. At the meetings of the Society, Dr. Smith's ample and varied knowledge enabled him, in a few acute and well-chosen remarks, to add to or illustrate almost every topic forming the subject of paper or discussion; though his modesty often restricted him to a brevity which other Fellows may well have envied as not being able to imitate.

### REVIVAL OF VENETIAN INDUSTRIAL ARTS.

A REPORT has been prepared by Signor de Zuccato, the British Vice-Consul at Venice, upon the industrial arts in that city. It is as follows:—

*Glass Manufacture.*—The art of manufacturing glass appears to have been brought to the Venetian lagoons by the early settlers from the mainland. Glassmaking has always been the principal industry of Venice and Murano, and some of the Venetian products have long enjoyed a world-wide fame. Beads, spun-glass, blown-glass, enamels, and mosaics, looking-glasses, &c., are all made in Venice.

*Beads.*—It is said that the invention of beads dates from the thirteenth century, and is due to two Venetians—Miotti and Imbriani—who were urged to make experiments by the celebrated Venetian traveller, Marco Polo. Under the Venetian Republic, and for some years after its fall, the exportation of beads had not reached the importance it has now attained. This was perhaps owing to the smallness of the furnaces and to the difficulty and length of the technical processes required for the composition of the paste. The Morelli, however, who, in 1670, were the principal bead manufacturers, had four ships at sea, carrying beads to the East on their own account, and they became so rich that in 1766 they entered the rank of the Venetian nobility on payment of a sum of 100,000 ducats to the Republic. Since 1815 this industry has become so important as to give at the present time employment to about 15,000 persons. The traffic is carried on with all the world, but the principal exportation of beads is to the ports of Asia and Africa. An extraordinary stimulus was given to this industry a few years ago by the prevailing taste for beads for trimming ladies' dresses. A great extension of the manufacture took place, and the labour was paid so high that all who could do so gave up their usual trades for bead-making. But when the demand for beads declined, most of the workmen who had been allured by fancy wages to the bead manufacture were thrown out of work and compelled to return to their former occupations. Whatever be the cause, beadmaking has always been the special privilege of Venice, in spite of all foreign attempts to manufacture this article elsewhere. Beads are sold under the following denominations: 1. "Conterie in perle," which are small perforated balls made either of glass or enamel. 2. "Jais," glass tubes of very small bore cut into short lengths. 3. "Pipiotis," jais cut into facets. 4. "Maca," a sort of pipiotis made in a mould. The wages in glassworks are for a first master about 8 francs a day, for a second master  $4\frac{1}{2}$  francs, and for the ordinary workmen from 2 francs to 3 francs a day. During the last five years the average annual exportation of beads has been 25,000 quintals, of the approximate value of 5,500,000 francs. The principal substances imported from the United Kingdom for bead-making are nitre, minium, sulphate of soda, and arsenic.

*Spun-glass.*—"Vetro filato" is made of the vitreous paste reduced to long slender filaments, which are then twisted into baskets, bonnets, girdles, garters, bands, &c.

*Glassblowing.*—The almost lost art of glassblowing, which flourished at Murano during the early part of the Renaissance, and the decay of which was due to the growing taste in the eighteenth century for the imitation of crystal, has only been revived of late years. The products of this branch of industry are known under the name of "soffiati ordinari," which are blown bottles, glasses, and other articles for domestic purposes, and "soffiati artistici," artistic ware of all shapes, admirably fashioned after the old models or in modern forms, richly decorated, occasionally with grotesques and enlivened with delicate and brilliant colouring. Nearly all the kinds of ware anciently known at Murano, such as "filagrana," "fiamma," "ritorte," "opale," "morise," "reticelle," &c., have been successfully reproduced by the modern artificers.

A large factory has been opened at Murano for the manufacture of glassware for household purposes. The company which has started the works is termed "Vetzeria Veneziana in Murano." It is to continue for twenty-five years from the date of the royal decree approving its constitution. The nominal capital is 700,000 lire, divided into fifty-six shares of 1,250 lire each, half-paid up, and the balance at the call of the council of administration. Fifty shares have already been taken up, of which eighteen are held by English gentlemen desirous to promote the industrial progress of Venice, and the remainder principally by Venetians.

**Mosaics.**—By the term "mosaic" is meant a sort of inlaid or tessellated work, an imitation of painting, formed by small pieces of marble, glass, enamel, or precious stones, such as lapis-lazuli, malachite, &c., of varying shades and colours carefully inlaid and fixed on cement. The art of working in mosaic was probably known in very early times, and was extensively practised in Greece and Rome at the time of the first emperors. Later on mosaics were widely used in the civilised parts of Europe for decorating the walls and vaults of churches, &c., and splendid relics of the mosaics executed in those times are still extant.

There is no place in the world, however, where this art has been more cherished than at Venice. Here Byzantine and Greek artists revealed to the Venetians all its secrets, and here was founded the Venetian school of mosaicists, who for centuries have covered the basilica of St. Mark with masterpieces of decoration, both within and without the building. But the glory of bringing the mosaic art to its height is due to the brothers Francesco and Valerio Zuccato, sons of Sebastiano Zuccato, master of Titian, who flourished in the fifteenth century. These artists executed their mosaics on cartoons drawn by themselves and by the most celebrated artists of the period. Among the numerous mosaics executed by them in the basilica may be mentioned the *Visions of the Apocalypse*, which have just undergone restoration. During the execution of the works in the cathedral the doge offered a prize of 500 ducats for the best reproduction of a particular cartoon. The competitors were Francesco Zuccato, Bartolomeo Bozza, and Dominico and Gian Antonio Bianchini. Titian, Tintoretto, Paolo Veronese, and other painters were directed by the Republic to inspect the works and to pronounce their verdict. The prize was awarded to Francesco Zuccato, and his work was presented by the doge to the Duke of Savoy. The mosaic executed by Bartolomeo Bozza is still preserved in the treasury of the basilica.

Ancient mosaic work was divided into lithostratum, vermiculatum, alexandrinum, &c., according as it was made of marble or other precious stones, and according to the figures or designs it represented. Modern mosaics are now distinguished under the two following heads: inlaid mosaic, and monumental or Byzantine. The former, which is made thoroughly smooth by fixing on to the cement the stone or enamel pieces with their edges perfectly close and adhering together, and by the subsequent polishing of the entire surface of the work, is generally used for making personal ornaments or fancy goods. The second is made of pieces which, not being cut into regular or geometrical shapes, cannot be closely united one to the other, so that the joints between them are visible. This was the mosaic generally used by the ancients, and has now been adopted for architectural decorations.

**Coloured Enamels.**—Coloured enamels for mosaics are composed of the same ingredients of which glass is made, with some other mineral substances, which, when fused with them, impart to the vitreous paste the required degree of opaqueness and colour. Thus they are rendered blue by oxide of cobalt, yellow by oxide of lead, uranium or wood-coal, green by oxide of copper or of chrome, &c., but the greater or less degree of their hardness and opaqueness and the quality and beauty of their colour depend also on the degree and continuance of the heat to which the composition is subjected in the furnace.

Gold and silver enamels are made in a different manner. On the flat surface of a piece of thick glass or enamel is laid a leaf of gold or silver which is made to adhere by the action of heat. A delicate film of the purest glass, either transparent or of any shade of colour, is then spread over it. When the three layers are fused they become thoroughly united, the metal, however, appearing in all its brightness, the glass with which it is covered being nearly imperceptible.

The mosaic art, which had declined with the decadence of the Republic and was nearly lost at its death, was revived by the strenuous efforts of Signor Lorenzo Radi, and afterwards by Signor Salviati, who by the aid of some English gentlemen established a large factory for the manufacture of mosaics about the middle of this century.

There are now in Venice three great establishments making mosaics for artistic mural decorations: 1. The Venice and Murano Company; 2. Salviati & Co.; 3. The Societa Musiva Veneziana.

The first is supported by English capital and gives employment to about one hundred workmen.

Among the recent works executed by this company, in addition to the numerous commissions received from England for church and other decorations, may be noticed the restoration of the *Visions of the Apocalypse* in the church of St. Mark; the entire reconstruction of two superb mosaics of the twelfth century in the ancient cathedral of Torcello, and the reproduction of the *Good*

*Shepherd*, a celebrated mosaic of the eighth century, existing in the tomb of Gallia Placidia at Ravenna.

The two other manufactories are also much esteemed for the perfect execution of their mosaics.

Other less important factories also exist which produce mosaics representing flowers, fruits, animals, landscapes, &c., which are chiefly made into brooches, bracelets, tables, and other similar articles.

**Pottery.**—There is no manufactory of earthenware in this province, although it has been ascertained that the mud of the lagoons would furnish an excellent material. An opening might perhaps be found here for the investment of British capital.

**Artistic Castings.**—The ancient art of fusing metals for the production of artistic articles, which flourished at Venice at the time of the Renaissance, has been revived with great success. Thirteen factories are now reproducing, after ancient models, artistic bronzes, candelabra, plates, armour, swords, etchings, chiselled works, &c., for which there is a considerable demand, which is not confined to Italy.

**Furniture.**—A new feature of Venetian industry, which appears to be encouraged by the English on a large scale, is the imitation of antique furniture in ebony and ivory, for which materials pearwood and bone are substituted. Carved chairs, book-cases copied from the antique, figures of negroes and others used as lamp-stands, hanging putti supported by a ribbon of wood and holding baskets for flowers, &c., are also made in the Venetian workshops with much artistic feeling and of excellent execution.

**Lace.**—Owing to the indefatigable exertions of some distinguished ladies, this industry, once so celebrated in Venice, and which had altogether sunk into decay, has been revived. Schools and manufactories have sprung up, and about three thousand women at Venice, Pelestrina, Murano, Burano, Chioggia, and Caorle are now employed in lacemaking. Their earnings range from 50 c. to 4 lire a day, and the value of the lace produced amounts to 200,000 lire per annum.

**Copying of ancient Brocade.**—The last speciality of Venice is the imitation of old damask. In the palmy days of the Republic the Venetian looms produced magnificent stuffs, embroidered with gold, silver, or silk, which the doges sent as gifts to foreign potentates. The art, which was entirely lost, was rediscovered in 1857, and is now recovering some of its ancient splendour.

## NEW WORKS AT HAMBURGH.

PLANS for the improvement of Hamburg have been lately submitted to a technical commission appointed by the German Government, and one has been accepted which will require an expenditure which is estimated at 106,000,000 marks. Bonded warehouses are to be extensively built on the borders of the outer Customs portion of the town. For the realisation of the project a great part of the old town will be pulled down, leaving, after deducting the space required for the free port canal which will divide the two portions, a building area of 43,000 square metres for warehouses and official buildings in the free port. From the upper port to the inner one, a Customs canal will be constructed  $2\frac{1}{2}$  miles in length, 45 metres in breadth, and 15 metres in depth, which will be bordered on either side by broad quay-streets. The entire ground of the Kehrrieder, Brook, Kleiner Fleth, Pickhuber as far as the Bei St. Annen, and a part of that street, will be included in the free port territory. The ground thus obtained will be cut by a straight canal of 25 metres in width, joining the future free port at its western end, discharging at its eastern end into the Brookthor port where the same is still in the free port boundary, so that those vessels coming from the free port canal can either pass by the eastern half of the Brookthor port into the duty-bound waters after having been examined by the Customs, or they may continue their voyage by way of the Magdeburger port. The southern shore of the Customs canal, as well as the centre parts of its three sides, will be supplied with Custom-houses all along. These alterations will involve the removal of upwards of 1,500 houses and buildings, tenanted by 15,000 persons, entailing on their part the finding of new residing places and entire loss of local custom to such as are engaged as retail shopkeepers. The compensation claims are therefore likely to be very heavy. Towards the impending estimated cost of 5,000,000%, the Imperial Government will contribute 40,000,000 marks, or 2,000,000%, which is to be paid to the Hamburg State in equal annual amounts spread over a term of ten years. A general estimate of the details is being drawn up, and as soon as this is in the hands of the Senate that body will commence negotiations with the Empire regarding the same, although it was stipulated that the incorporation treaty should not, if necessary, be enforced until October 1888. The actual works will be commenced at as early a date as possible. The expenses to be met by the Hamburg State will be raised by loans, probably bearing interest at  $3\frac{1}{2}$  per cent., but this interest must not be regarded as an additional burden on the Hamburg taxpayers, since as soon as the incorporation takes place the annual payment of 250,000% now made by this State to the Imperial treasury for her exemption

from the Zollverein will cease. From a fiscal point of view, the Hamburg Government, therefore, may be said to have gained very good terms, but the result to the Hamburg trade is too much a matter of doubt for any opinion to be expressed.

## SANITARY REGULATIONS IN SAN FRANCISCO.

THE following regulations by the Board of Health are now in operation in San Francisco:—

1. All material must be of good quality, and free from defects. The work must be executed in a thorough, workmanlike manner.

2. The arrangement of soil and waste-pipes must be as direct as possible. The drain, soil, and waste-pipes, and the traps should be exposed to view for ready inspection at all times, and for convenience in repairing.

3. Every house or building must be separately connected with the street sewer by a cast-iron or iron-stone pipe extending out to the line of the street; and in the case of buildings erected on the line of the street, said cast-iron pipe shall extend three feet beyond the front walls or any area wall. From the points above designated to the street sewer, the drain shall be continued either by the above-mentioned cast-iron pipe or by a vitrified iron-stone pipe laid at a uniform grade from the street sewer to the point of juncture with the cast-iron pipe. All joints on said iron-stone pipe shall be made with Portland cement, and each joint of pipe when laid must be properly cleaned on the inside by a suitable scraper before the succeeding pipe is put in place. All joints on a cast-iron pipe shall be made with a suitable packing of hemp or oakum, and run full with molten lead and properly caulked.

4. Every building hereafter erected must have the house drain constructed of cast-iron when it lies under the building; when the drain lies under any open space it may be of iron-stone pipe. The house drain must be made of cast-iron, with a fall of at least one-quarter of an inch to the foot; it should run along the cellar wall where practicable, or if laid under the lower floor of a building should be hung in iron straps securely fastened to the floor joints; it should be laid in as straight a line as possible. All changes in direction must be made with curved pipes, and all connections with Y-branches and one-eighth bends, with a trap placed under the side-walk, and have a curbed casing, so as to be easy of access at all times. The trap must be provided with a fresh-air inlet on the house side of the water seal, of at least 4 inches in diameter, leading to the outer air. No brick, sheet metal, or earthenware flue should be used as a sewer ventilator, nor shall any chimney flue be used for this purpose.

5. Every soil and waste-pipe shall be of cast-iron, and must extend at least 2 feet above the highest part of roof or coping of undiminished size. There shall be no traps or vertical soil or vertical waste-pipes.

6. All cast-iron pipe and fittings must be coated both inside and outside with coal-tar pitch, applied hot, or some other equivalent substance.

7. All iron soil or waste pipes, before being covered up, must have all openings stopped, and be filled with water and allowed to stand until inspected and approved. All connections of lead with iron pipe must be made with a brass ferrule of the same size as the lead pipe, and caulked into the iron pipe, and connected to the lead pipe by a wiped joint. All connections of lead pipe should be wiped joints.

8. Every water-closet, sink, basin, bath, or set of wash trays or other vessel connected with the drain pipes, must be separately and effectively trapped. The traps must be placed as near the fixtures as practicable.

9. Traps must be protected from syphonage by special air pipes of lead, wrought iron or cast iron, not less than the size of waste pipes, and if to supply air to traps of water-closets, not less than 2 inches in diameter; if for a single closet and the length does not exceed 15 feet, the size to increase with the length of pipe and the number of closets. These pipes must extend 2 feet above the highest point of roof or coping, or they may be branched into the soil pipe above the highest fixture; they may be combined by branching together those which serve several traps, provided that said branches enter a pipe whose area is equal to the combined areas of all the branches. These air-pipes must always have a continuous slope, to avoid collecting water by condensation.

10. Every safe under a basin, bath, urinal, water-closet, tank, or other fixture, must be drained by a special pipe of lead or wrought iron, not directly connected with any soil, waste-pipe, drain or sewer, but made to discharge outside the house.

11. Rain-water leaders must never be used as soil, waste, or vent-pipes, nor shall any soil, waste, or vent-pipes be used as a rain-water leader. All leader-pipes must discharge into a trapped intercepting hopper, or on the surface of the ground, supplied with a water-faucet.

12. No steam exhaust will be allowed to connect with any drain, soil, or waste-pipe.

13. All waste-pipes from all interior plumbing, exclusive of water-closets and kitchen sinks, shall discharge into an open-trapped hopper.

14. On and after the first day of August, A.D. 1883, all plumbers doing business in the City and County of San Francisco shall register, pursuant to the provision of the Act of the Legislature, approved March 16, 1883, at the Office of the Board of Health.

15. Every master plumber, before he shall be allowed to be registered, shall give a bond to the State of California in the sum of five hundred dollars, with two good and sufficient sureties, for the faithful discharge of his duties as plumber; which said bond shall be approved by and filed with the Board of Health.

16. There shall be appointed by the Board of Health an Inspector of Plumbing and Drainage. He shall take and subscribe to an oath that he will faithfully perform the duties of his office, and shall, before entering upon his duties, execute a bond to the City and County of San Francisco in the sum of five thousand dollars, with two good and sufficient sureties, conditioned for the faithful performance of the duties of his office, and for the benefit of persons aggrieved by his acts or neglect. Said bond shall be approved by and filed with the Board of Health.

17. The salary of the Inspector shall be fixed at one hundred and twenty-five dollars per month.

### Trade Circulars.

SIR,—As a provincial architect, I am astonished at the quantity of trade circulars that reach me daily; nearly every post brings a batch—large sheets, small sheets, books, show-cards, pamphlets, and samples—and if I were to preserve all I receive for future reference, I should require an extra office and clerk for arranging them, to say nothing of the wall space to hang the cards upon; the result is that the waste-paper basket receives by far the larger portion. This to me appears to be a great waste of cash, and must come out of the profits, although I am quite alive to the importance of being in possession of the various manufactures, and I carefully scan all I receive, and keep large piles for reference, the accumulation of nigh upon forty years; but it often occurred to me that if something like order were adopted by the senders, in the sizes of their documents, they would be much more likely to be saved, and much easier for reference. Suppose, for instance, that all documents were issued foolscap size, a pile of these would not be unsightly, and would fit the ordinary foolscap receptacles, and references would be facilitated by turning over leaves all the same size, instead of which my shelf of trade circulars, although kept as well as can be, is a complete muddle, and to find what you require is like searching for a needle in a bundle of hay. As an instance, this morning's post brought me two documents, one a book 6 inches by 3½ inches, and another a sheet 3 feet 3 inches by 2 feet 2 inches. The question is, What am I to do with them? for they are both worth saving.

Bristol, August 16, 1883.

Yours, &c.,

H. M.

### LEGAL.

#### Nottingham County Court.

(Before Mr. G. B. BRISTOWE, Judge.)

BALL v. HOLLINGWORTH AND CLARKE.

THE EMPLOYERS' LIABILITY ACT.

The plaintiff was a joiner employed by the defendants, who are builders. He was engaged in preparing scaffolding for an iron roof. While so engaged he placed his foot on an iron distance-rod, which was loose, and, falling, sustained concussion of the spine. He claimed 200*l.* damages. After the plaintiff and his witnesses had given evidence, counsel for defendants submitted that he had no case to answer, as it was not brought within the provisions of the Act. He contended that, even according to the plaintiff's own statement and the evidence of his witnesses, there was sufficient proof of contributory negligence on the part of the plaintiff himself to relieve the defendants.

The Judge said that the plaintiff was employed to do work which required skill, care, and caution on the part of the person doing it. There could be no doubt that the distance rod was unfastened, and could be seen by anybody who looked at it. He could not see how the case came within the provisions of the Act of Parliament. Sitting in his capacity of judge and jury he thought that there was not sufficient evidence to justify him in saying that there was a case to go to the jury. If there had been a jury, he would have sent the case to them with regard to the question of contributory negligence. He did not think that there was any question of a defect in the ironwork, and he must find a verdict for the defendants on the plaintiff's own case. The Act of Parliament under which these proceedings were brought was a most beneficial one, but it would be a safe plan for plaintiffs in such cases to consider carefully before bringing actions whether they were not guilty of negligence themselves.

## CHURCH BUILDING AND RESTORATION.

**Steeple.**—The foundation-stone has been laid of the church of St. Laurence and All Saints, which is erected on a site granted by the Governors of St. Bartholomew's Hospital. The new church will consist of nave, chancel, organ chapel and vestry, and south porch. The nave will be 58 feet long by 21 feet wide, surmounted at the west end by a bell-turret, this being supported by the western wall and an inner double arch supported by a column. The chancel will be 24 feet long by 17 feet wide. The walls throughout are being constructed of the old materials, worked in random, and every fragment of dressed stone is being used in for its original purpose. The period selected is the transition from Early English to Decorated. The roof will be open timbered, divided into five bays by principals, with moulded ribs resting on stone corbels. The chancel roof will be boarded and divided into panels by intersecting ribs. Both roofs will be tiled. The nave will be lighted by four two-light windows and seven single-light windows on the north and south sides, and two single-light windows at the west end. The chancel will have a three-light east window, and one three-light and two single-light windows on the north and south sides. The turret at the west end will be 10 feet square, the bell-chamber being framed in oak, with lowered lights on either side, the whole surmounted by a spire, covered with oak shingles. Internally the floors will be boarded under the benches and the gangway paved. The sacristy will also be paved with tiles of a similar pattern. The organ chapel and vestry, 11 feet by 10 feet, will be on the north side, connected by a stone arch with the chancel. The porch will be of oak, with traceried sides and front. The church will be heated by a hot-air apparatus. The church will accommodate 150 adults and 56 children in the nave, and 12 adults and 14 boys in the chancel, or a total of 232. The architect is Mr. F. Chancellor, of Chelmsford, and Mr. Letch, of Braintree, is contractor.

## SCHOOL BUILDINGS.

**Bradford.**—The new Board School in Charlton Street was opened on Monday. The site has an area of 10,662 square yards, the cost being 5,331*l.* 14*s.*; the building and furniture of the school have cost 13,968*l.* 13*s.*, the total expenditure being thus about 19,300*l.* The school provides accommodation for 1,501 children. The buildings are two storeys in height, the higher girls and the infants' departments being on the ground-floor, and the elementary boys and girls' schools being upon the upper floor. The front of the building and the two ends are executed in clean cut wall-stones, with ashlar dressings, but moulding work has been sparingly used, except about the centre portion of the main elevation and the gables at each end. On the main front there are four ornamental gables and dormer windows, which have moulded pediments and terminals. The roof of the centre portion of the building is partly formed with lead flats, around which are ornamental crestings. There are three large ventilators rising from the roof, specially designed to correspond with the architecture of the building. In each division of the school there are four departments, each of which has a main schoolroom and five class-rooms, with accommodation rooms for the teachers, fitted with lavatories, &c. The class-rooms are of large size, but they vary in length, those on the ground-floor being about 46 feet long, and those on the upper floor 67 feet long. The average size of the class-rooms is about 20 square feet. A new feature in this school is the provision of two Kindergarten class-rooms. The approach to the upper school is by means of a broad stone staircase. The interior fittings of the school are of pitch pine, varnished, and the desks and seats are of similar wood. Messrs. John Moulson & Son were the contractors for the work. Mr. C. H. Hargreaves, of Bradford, is the architect of the school.

**Birmingham.**—The alterations and additions are nearly completed at King Edward's School, part of which will become a high school for girls. A new gymnasium has been erected; the hall measures about 90 feet by 40 feet, and is 40 feet high. The works have been carried out under the direction of Mr. J. A. Chatwin, architect; the contractors are Mr. Pashby for the alterations, and Messrs. Sapcote & Sons for the gymnasium.

## GENERAL.

**Mr. Val. Prinsep, A.R.A.,** has taken the Old City Library building, Worcester, for a short term, and intends to use it as a studio during his stay in Worcester.

**The Original Model** of Watson's statue of *Flaxman* in the vestibule of University College, Gower Street, has been presented to the Corporation of Carlisle by Mr. Nelson, who was formerly an assistant to Musgrave Watson.

**Battle Abbey** was on the 14th inst. visited by 1,500 people, who were admitted in batches of fifty.

**Mr. J. Honeyman, F.R.I.B.A.,** is now preparing a report on the competition plans for the proposed Town Hall at Hawick.

**Mr. G. B. Bruce, C.E.,** has been deputed to represent the Institution of Civil Engineers at the opening of the Northern Pacific Railway, United States. The Company forwarded six invitations to the English Foreign Office for disposal.

**Rochester Castle** is to be purchased by the Rochester Corporation, the sum to be paid being 8,000*l.* The property has been held on lease by the Corporation at an annual rental of 240*l.*

**The Local Government Board** have refused to lend 390*l.* to the Brecon Town Council, on the ground that the sum advanced in 1835 to build a town hall remains unpaid.

**Peterborough Cathedral.**—The foundations of the south-east pier which supported the now demolished Lantern Tower of Peterborough Cathedral were unearthed on Monday, and were found in a crumbling state many inches below the original level. A conference of the architect, the contractor, and the Chapter will be held.

**A Subsidence of Land** at Boosbeck, near Guisborough, has caused the destruction of between fifty and sixty houses.

**A Brass Tablet** has been placed in the parish church, Windsor, as a memorial of Thomas Sandby, who was one of the original Royal Academicians. The inscription records that Sandby was born at Nottingham in 1721, acted as Private Secretary to H.R.H. William, Duke of Cumberland, in his campaign in the Low Countries, and at the battle of Culloden in 1745; was appointed Deputy Ranger of Windsor Park in 1746; designed the Virginia Water, and planned the various improvements in Windsor Park during the following fifty-two years; was nominated by King George III. one of the Foundation Members of the Royal Academy of Arts in London in 1768, and elected Professor of Architecture in that institution. These offices he filled until his death at the Deputy Ranger's Lodge, Windsor, on June 25, 1798.

**The Midland Railway Company** have during the past six months expended 11,249*l.* for the enlargement and rearrangement of stations, and 18,168*l.* for reconstruction of bridges.

**Messrs. Doulton & Co.** have been awarded two diplomas of honour—being the highest awards—in respect of their exhibits of fitted sanitary appliances and artistic pottery, at the Amsterdam Exhibition.

**Mr. Joseph Constantine,** of Manchester, has, in consequence of the increase of his business, opened an office at 144 Fleet Street, London, for the sale of his patent convoluted stove.

**Messrs. Charles Williams & Co.,** the Ferry Iron Works, Cubitt Town, have taken Mr. Hugh Stanton into partnership. The style of the firm will remain as before.

**The Excavations** carried on by the French school at Athens, in the island of Delos have led to one important discovery. Near the theatre of Apollo a private house has been discovered, probably of the Alexandrine period. A court surrounded by pillars and twelve rooms has thus far been revealed. The floor of the court is of beautiful mosaic, containing flowers, fishes, and other ornaments, and in the middle of the court there is a cistern. The gate of the house and the street leading to it have also been dug out.

**A Committee of Engineers** has been appointed for the purpose of considering various matters in connection with the constitution of the Indian Public Works Department; for example, the reduction of the numerical strength of the department consistently with its efficiency, the acceleration of promotion, the offer of terms upon retirement, and the proportions in which the department shall be recruited from the ranks of the Royal Engineers, of the civil engineers from England, and of the students of the Indian colleges. Mr. Guilford R. Molesworth will preside. The committee consists of ten members, representing different classes—namely, two Stanley engineers, three from Cooper's Hill, two Royal Engineers, and three civil engineers from the Roorkee Presidency College.

**Gilchrist Engineering Scholarship.**—The Gilchrist Engineering Entrance Scholarship at University College, London, will be open to competition at the end of September. The conditions of examination are this year somewhat altered in a direction which places the scholarship better within the reach of those for whose benefit it was founded. The detailed regulations can be obtained on application to the secretary of University College. The following is a summary of them: Candidates must be under nineteen years of age, and must send in notice to compete by September 23. The subjects of examination are (1) elementary mathematics and (2) any two or more of the following five subjects: Mechanics, mechanical drawing, essay on one of three given subjects connected with mechanics or engineering, French or German, the use of tools, either carpenters' tools, or the lathe (wood or metal), or the file. The scholarship is of the value of 35*l.* per annum, and is tenable for two years. There is also at University College a Senior Engineering Scholarship, awarded at the close of the session, of the value of 80*l.* The regulations affecting this scholarship, as well as those of the Andrews entrance prizes, &c., can be obtained on application to the secretary.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, AUGUST 25, 1883.

### TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*\*\* Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Supplement to THE ARCHITECT."*

### EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

### COMPETITIONS OPEN.

**BRISBANE.**—Nov. 30.—Plans are invited for the Erection of a Town Hall. Messrs. Gordon & Gotch, 15 St. Bride Street, E.C.

### CONTRACTS OPEN.

TURNEY'S  
SIZE  
POWDER.

TURNEY'S IMPERIAL CONCENTRATED  
SIZE POWDER

FOR THE IMMEDIATE MANUFACTURE OF SIZE.

Specially prepared for the use of House Painters, Decorators, and Manufacturers. Celebrated for its purity and strength. Guaranteed free from anything calculated to injure Colour or Fabric.

*This Preparation possesses the following advantages over ordinary Size:—*

- 1.—It is cheaper, being equal to ten or twelve times its weight of Patent Size.
- 2.—It is more efficient, the Size made from it being more tenacious, and perfectly pure.
- 3.—It is more convenient, a Size of any strength, and in any required quantity, being made at any minute, thus saving time and waste.
- 4.—Will keep any length of time in a dry place, and is therefore never liable to become mouldy, or acquire a disagreeable smell.

*This Powder supplies a want long felt by all users of Size, as it at once does away with the great inconvenience of the old method, and supplies a Size both cheaper and more efficient.*

Packed in Cases containing 28, 56, and 112 1-lb. Packets. Samples, Prices, and Testimonials on application.

PREPARED ONLY BY THE ORIGINAL MAKERS,

W. J. TURNEY & CO., LEATHER, PARCHMENT, & GLUE WORKS, STOURBRIDGE.

# The Architect.

## APROPOS OF THE WELLINGTON STATUE.

**M**R. SHAW-LEFEVRE is said to have issued the official *fiat* by this time for the demolition, without more debate, of the unfortunate colossus which was intended to do so much honour, and was found to do so little, to the great Duke of WELLINGTON. The metal is to be used for another statue of the Duke, which is to be placed on what is virtually the same site, but with a less degree of ambitious artistic motive, and, it is to be hoped, a greater degree of ordinary artistic success.

It is part of the price we pay for our constitutionalism that this resolution of the First Commissioner of Works, although unmistakably approved, indeed inspired, by the opinion of Parliament and the public at large, is still regarded here and there as an outrage to propriety. An offer, it is reported, has been actually made by some despairing malcontents to purchase the unhappy sculpture with money, in order to save it, as they think, from desecration. Even such "friends of the Duke" as would scarcely care to go so far as this commercially have been no less active on moral grounds, pleading almost piteously for the preservation of the "portrait" of the hero, and the "portrait of his horse Copenhagen," for the sake of that good taste in loyalty which no doubt, when really in question, may be acknowledged to be of more value to most of us than all the good taste in art can ever pretend to be. But the plain English of the matter is easily understood. The Duke, when he was alive, although not at all responsible for the statue itself as a work of art, took upon himself the whole responsibility of insisting upon its being allowed to occupy the peculiar pedestal which had been assigned to it. His reasons of course were not artistic, but they were, as he thought, far better and more forcible, because more military. But, now the Duke is dead, his reasons are differently regarded; or rather, the public opinion which went against his reasons seven-and-thirty years ago goes against them still, while the respectable, but very small, minority of more or less military persons who upheld them then successfully uphold them now to no effect. Considerations of artistic common sense, to put the case on no higher ground, have at length asserted themselves quietly and respectfully, but very firmly. The statue was a frightful blunder, and is to be so acknowledged and dealt with. It was a discredit, not to say a disgrace, to English art, and as such is to be abolished. To break it up for old bronze is no dishonour to the memory of the great commander; on the contrary, it is felt that to perpetuate such a *fiasco*, even as a curiosity—one cannot say as a historical object—would be a positive dishonour to both the past and the present. So another statue is to be substituted at the national expense; and, with what is hoped to be vastly better art, it shall at least be fabricated with the self-same metal.

One of the first reflections that will arise in the minds of some whose opinions must have great weight upon such a question, is why the new statue should not be so far like the old as to be on the same scale. As a colossal equestrian figuré, unique in England, the old statue, in spite of its inartistic character, and its almost still more inartistic disposition—in spite, let us plainly say, of its complete vulgarity—was always regarded as a great sight, one which every visitor to London must go and see. Even when compared with the colossal *ACHILLES*, which watched over the back of the Duke's house while the other colossus stood on guard at the front, this prodigious portrait figure had all the advantage in the eyes of that good-natured majority of the people whom after all it is in such cases always well to conciliate. Why, then, should they be now deprived of the enjoyment of the heroic bulk of the sculpture? The bronze is in quantity enough to make a statue on the same grand scale, and it seems a pity indeed that the memorial, once so imposing in size, should be brought down to a common level for no reason at all that has been named. Is it considered to be settled that

Englishmen are unequal to the design of a heroic figure? This is the only reason we can imagine to have any force, but we cannot believe that such an idea has really taken possession of the official mind.

This new enterprise has started again in the press, as could only have been expected, the well-worn sarcasms with which our monumental statues are customarily assailed whenever an occasion offers. Perhaps there is nothing in the whole range of the newspaper criticism of the fine arts in England which more effectually shows its too frequent futility, than the indiscriminating discredit awarded to the works of monumental sculpture which have been set up in the streets of the metropolis. No one who has an artistic eye in his head can deny that some of those statues are more or less badly modelled; but it is equally true that the great majority of them are, to say the least, of very fair merit, while some would be worthy of a site in any town in Europe. Take, for instance, the single neighbourhood of Trafalgar Square. It is one of the affectations of the kind of criticism we are speaking of to point to the King *CHARLES* at Charing Cross as absolutely the only thing worth looking at. Now we will take leave to acknowledge that the *NAPIER* is an exceedingly unfortunate specimen, and the *HAVELOCK* little better; but there are worse things abroad than the *GEORGE III.* in Cockspur Street, and the stirrupless *GEORGE IV.* As another instance, what are we to say of the criticism which ridicules at Waterloo Place the Guards' Monument, and sanctions the Lord *LAWRENCE*? One of the most urgent of all *desiderata* in journalism just now is that kind of criticism—to be administered of course by true critics—which shall point out by name, if not the bad, at least the good examples of such art that are before the public eye, and which, instead of meeting every new proposal with the same facile sneer, shall guide public opinion to a right conclusion by skilful illustration derived from the many instances of recognised merit. If, amongst all the productions of art, a statue is the most easily ridiculed, that is because it is the least easily understood.

We venture especially to hope that in the present case some one may be consulted who will be able to guide the authorities aright in difficult circumstances. For it is useless to proceed to set up another monument to the Duke of WELLINGTON unless it is to be worthy of the highest esteem on other grounds than the personal reverence which must now be regarded in a great measure as the impulse of a past generation. Especially if it is to occupy the position which is proposed, at the central point of the recently-formed area between the parks, ought it to be a work worthy in these days of such prominence.

But there are many who would wish to see the statue placed elsewhere. Apsley House is not what it was. The advance of building art has left it a long way behind; the few sightseers who care to look at it are inclined to think it a poor thing; it looks like a house that before very long will be "improved away" altogether and scarcely missed.

There is one suggestion which, whether it may be thought worth making or not on higher ground, ought perhaps to be submitted to the public, if only for the purpose of directing attention to that most singular shortcoming in respect of our public statuary—the vacant pedestal in Trafalgar Square. The naval conqueror of the great war has a most noble monument there; the royal master is also very fairly represented; why not let the military leader complete the group? If we have a sculptor capable of matching the horse and rider of *CHANTREY*, he need never complain of such a site as this; and we are much mistaken if there are not many persons who would regard with much more favour the erection of a statue to WELLINGTON in the great central *place* of the town than the restoration of a memorial which, in very questionable taste, they say, was put up in front of the old soldier's windows, and came deservedly to grief.

Another way in which the vacant pedestal might be occupied in honour is perhaps worthy of being referred to; for sooner or later occupied it must certainly be. That the father of Queen *VICTORIA* might fairly claim such a distinction everyone will surely acknowledge. If it were only in memory of two bright princesses, on whom, each in her day, the hopes of the nation were so fondly set—one destined to pass away in her early youth, and the other to be through a long life the most popular sovereign in all the world—the statues of the brothers *GEORGE*, Prince of WALES, and *EDWARD*, Duke of KENT, thus associated, would be objects of some interest for ages to

come. We say nothing of the personal compliment to HER MAJESTY, which might surely have been offered long ago.

### CIRCULAR NOTES FROM FRANCONIA.

[BY A CORRESPONDENT.]

NO country lends itself better to the planning of small tours than Germany. The history of the people, the conformation of the land, subdivide the country into districts which retain distinctive features of climate and scenery, and of race and customs that even to the present time have withstood the levelling influences of modern political and commercial progress, and keep up invisibly the boundary lines which have been erased from the school map of the day. One such district is that part of Upper Bavaria to which still clings in local appellation the name of Franken, or, as we call it, Franconia. Within Franconia the citizen life, which was so active an energy in national progress during the fifteenth and sixteenth centuries, came to full flower in the industrial towns, with Nürnberg and Augsburg at their head, left its impress on all the arts of use and ornament, and may be said to have created a style of domestic architecture. Along the valley of the Main a dominant and splendid ecclesiastical aristocracy set palace-like convents upon the hillsides, flourished under prince-bishops in the stately towns of Bamberg and Würzburg, and did its utmost to quench the sturdy spirit of the burghers. It is notable of the character of these Franconian folk that the reformed doctrine early won acceptance with them. It represented freedom and resistance, and the Franconians were always struggling for their rights, whether against imperial, princely, or ecclesiastical oppression. The traveller throughout this district cannot fail to mark that a certain independence and sturdiness continue to characterise the people. Franconians are well-looking, alert, and eminently assiduous; they develop their industries without ostentation or empty speculation; they cultivate the land till it smiles with fertility, and deserves its time-honoured title of a "friendly land," as they are themselves certainly a friendly people.

The circular note which entitles our letters starts from Frankfurt-am-Main, drops down from Würzburg to Nürnberg, crosses the "Franconian Switzerland" to Baireuth, turns round to Bamberg, and loops itself to Würzburg again. The line from Frankfurt to Würzburg is most attractive, especially in the later summer months, when the woods are in their full beauty, and the harvest fields and pastures ready for the sickle and wain. After passing Aschaffenburg, the route ascends into the high regions of the Spessart, a range of lofty granite and slate hills, thickly planted with pine and fir, and the original growth of beech wood, fine in form and intersected by deep valleys, where hamlets of old red-tiled and timbered houses picturesquely cluster on the slopes or in the meadows about their churches, little deep-toned, towered buildings, or often hardly more than a big cottage, with a tiny bell-steeple and deep roof. Clear streams of irrigation thread the bright green pastures with silver streaks, and trees of softer foliage enrich the more sombre colouring of the fir plantations. On the eastern side the hills break graciously down, and at a convergence of their wooded shoulders towards a curve of the brimming river Main the charming little town of Lohr lifts its church towers and high-gabled ruddy houses against the forest background. The Main valley hereabouts is full of attraction for artists and anglers. In July and August the people are out in their picturesque costume at work in the harvest fields, grass pastures, and various crops; the women in scarlet bodices with white sleeves, and scarlet kerchiefs folded on their heads, stand and stoop with their reaping-hooks amidst the golden corn, or carry big bundles of green stuff on their heads; and the men, in the ever-harmonious blue blouse, guide the long pole waggons drawn by oxen. Fishing stations are scattered along the shining stream at irregular intervals; here and there a ruined castle on the hills frowns down into the valley, with remembrance of less peaceful days; or a little town with remnant of old wall and tower, such as the quaint Gmünden on the tributary Saale, juts forward under the shelter of a cliff. Side valleys open up into the hills on either side, and tempt the pedestrian to explore them, and the artist, with sketch-book in hand, finds constant material for pictorial notes, and a most delightful wandering ground.

Würzburg, although finely placed about and above the Main, and with its many church towers and commanding citadel on the Marienberg, once the fortified residence of the truculent prince-bishops, imposing from the approach on the Frankfurt side, is rather a disappointing town. The narrow, quaint streets, of which old guide-books speak, are pretty much things of the past; the great Platz gapes like the squares at Darmstadt, with too much space for the scale of the surrounding buildings. Renovation is busy with the ancient monuments, and travellers who have known the town in past days will tremble to hear of restoration and demolition. At the side of the Neue Münster Church, the ancient origin of which can now only be traced in the Romanesque crypt, where St. KILIAN, the Irish missionary and apostle of Franconia, lies re-buried under a painted altar—the original stone sarcophagus being kept, however, a few yards off—an enterprising tradesman has purchased a piece of land whereon to erect himself a big house opposite his shop; some old buildings have come down, and an interesting piece of cloister arcade in red sandstone is laid bare. This is to be preserved, but moved nearer the church; meantime it has been photographed. The date is early in the thirteenth century. There is a double row of pretty pillars, and some curious small memorial reliefs of figures, mottoes, and medallions. Among these is a portrait of WALTHER VON DER VOGELWEIDE, the Minnesinger, who was buried in the cloisters, with his name and "Spruch," or verse, barely decipherable now.

The lovely Gothic Marien-Kapelle (1377-1479), on the market-place, is being patched with red sandstone, which, as it keeps its colour, will ever give a harlequin appearance to the rich exterior. One tower has been at a previous period erected in the same ruddy material, and looks odd enough. The excuse for this motley mending is that the original dark-coloured stone was too friable to bear the weather. This presumably is the reason why the entire interior, with its slender shafts, light vaulting, elegant lancets, and canopied statues on every pier, is painted all over with an oily pale buff, picked out with gilding, and, in the case of the sculpture, adorned with polychrome. This treatment, together with the tasteless church furniture, does much towards spoiling a design which, in its lofty airy proportions and delicate members, reminds one of the Sainte-Chapelle. The exterior is rich with crocket, canopy, and sculptured figures, amongst which episcopal saints figure largely. The reliefs on the tympanum of the portals are particularly quaint in conception, but have little of the noble energy which marks French sculpture of the same period, being rather chiefly notable for homely but ready invention. The *Last Judgment* over the western door shows CHRIST seated with hands held palm outwards; from His mouth proceed two swords. An angel holds a crown like a cushion over his head; two others float on either side, one bearing the cross, the other the spear and scourge; the MADONNA and St. JOHN BAPTIST below respectively kneel in supplication with folded hands, St. JOHN, if it be he, clothed in flowing drapery with hair smoothly parted; four tiny figures half risen from rocks or coffins, and two angels sounding the resurrection trumps, fill up the interspaces. Below, again, the body religious and episcopal receive favourable treatment, inasmuch as no less than two mitred figures, a monk and two nuns, are, out of a group of nine, allowed smiling full grin to enter the gate of Heaven, built like a Gothic porch, while some villainous-looking fellows in tall caps of a lay description are triumphantly pulled along with a chain by a devil the other side. Underneath, a confusion of little heads and plank-like objects reveals itself on close inspection as the dead struggling with their coffin-lids, the artist's object being apparently to leave no space unfilled.

The figures are by no means without expressive action, but all of a homely kind; the draperies are cast rather after the character of metal-work, which is a characteristic of early German sculpture. On the north side a relief of *The Annunciation* shows the same grotesque invention. Above sits the Deity, and from his mouth the Spirit descends in a stream, which enters at the back of the Virgin's head, while the angel GABRIEL is expressing the glad import of his message with a joyful grimace that is most comic. The sculpture in this chapel is throughout of a lower school than the architectural design or purely decorative work, and is certainly much inferior to work of an earlier date in the neighbouring cathedral city of Bamberg.

The Domkirche of Würzburg is a transmuted edifice of early foundation, built to commemorate the place of martyrdom

of St. KILIAN, and showing some remnant of Romanesque style on the exterior. The interior is imposing, in spite of horrible trumpery in the way of modern decoration, by reason of its magnificent series of memorial effigies. On every pier of the nave, between the bays and on most of the returns, are the life-size figures, in high, almost round relief, of the long array of bishops who have borne not only spiritual but temporal rule over Würzburg, from GOTTFRIED I. of Pisenburg (1190) down to the round-faced, rather sheepish-looking prelate who departed in 1840. Nearly all of these effigies are full length, and in chief instances the most remarkable memorials of the kind in Germany. The material varies from the rough red stone, used so much in this district, to marble and alabaster. The early monument of Bishop GOTTFRIED is impressive by its simplicity; he wears stole, maniples and gloves, and a simple three-cornered cap like one often now used by priests; holds his plain curved episcopal staff in right hand, clasps the Gospel book with the left, and looks out of his coffin-like enclosure with a grave, resolute aspect—a long-nosed face, with large eyes and a full, straight mouth, with close-cut moustache and beard. In contrast to this rough but dignified and emphatic figure is the remarkable and highly-wrought monument of RUDOLF II. VON SCHERENBERG (died in 1495), the most striking of several works by the famous RIEMENSCHNEIDER. This represents an old man of ninety-two, toothless, with skin worn to parchment over the handsome, straight, delicate nose and stern curved brows; a remarkable physiognomy, full of pride and energy; the ruling passion strong in the almost death-stricken lineaments. There is no mistaking the character; the bishop is not only a prince, but a man of war, reluctant to depart the battle-field of life, and still clutching both crozier and sword—the sword, be it noted, held in the right hand. The pomp of office enriches the jewelled mitre, embroidered vestments, and gloves. The crozier is a miracle of rich Gothic convolutions; angels with crumpled draperies and full wigs uphold armorial bearings and support a tablet containing the titles and virtues of the deceased, while heraldic lions on either side do duty with two more of the six escutcheons necessary to the complement of the bishop's family emblazonments. A rich Gothic canopy completes the *ensemble* of this remarkable monument, which is, of course, in no commoner material than marble. Several other of these effigies deserve like close description, some having extremely curious background detail, descriptive of events in the history of the prelate represented, or accessory figures of interest in type and costume; but, on the whole, this *chef-d'œuvre* by RIEMENSCHNEIDER is the most notable for portraiture of a striking kind and for artistic treatment. One or two of the monuments have been removed into the church from the walls of a side crypt chapel, the floor of which is literally paved with memorial slabs, whose sculptured reliefs are worn down by the feet of irreverent centuries.

Among other objects of interest in the Dom are the very beautiful beaten iron gates of the choir, work of a local artist within the century, and worthy of old German traditions. But from an antiquarian point, the treasure of the interior is the old bronze font by ECKHARD, of Worms, date 1279, shaped like a tub, with buttresses headed by early Gothic pinnacles, and arcaded on the side and frame in quaint high reliefs from the life of CHRIST. The figures are stumpy and broad-headed, with thin extremities, but have considerable energy and character. The details are grotesque, and the treatment is archaic in a rude conventionalism. The Virgin in the Nativity lies on a cushioned couch, and has the Infant in minute scale placed on a sort of shelf above her, with the heads of two oxen projecting over it, as much as to say, "This is a manger," while JOSEPH, crowned with quite a regal night-cap, sleeps leaning on his staff, and sitting on a box inscribed with the text. A similar box serves as pedestal for the angel who superintends the baptism of CHRIST by St. JOHN, wherein, with a naïve disregard of natural laws, the coils which represent the water in which CHRIST is immersed to the waist, are very much higher than the shore on which the Baptist stands. The whole work is interesting from its transitional character, and the bold treatment of high relief. The draperies are long and rigid in cast, neither so flowing as early Romanesque work, with its Classic traditions, nor so free and fantastic as later Gothic.

The sights of Würzburg are for the rest sufficiently noted in MURRAY'S Guide (BAEDEKER'S is very scant of record). The citadel, with old structures in the chapel and elsewhere; the stately bridge, with its statues of bishops on the pier parapets;

the palace built by two bishops of the SCHÖNBORN family, who by the way, have a chapel to themselves in the Dom, full of bad taste and rich material; the great hospital founded by JULIUS ECHTLER, in 1572, one of the best episcopal rulers of the list; and the pleasant gardens on the glacis, or line of the old fortifications, two-thirds round the town. Altogether, with its fine situation, wide river, university, pretty villa residences and pleasant streets, lovely neighbourhood and good market, Würzburg is not at all a bad place for residence, independently of its stirring history and remains of artistic and antiquarian interest.

#### BOROUGH SURVEYORS.\*

THE position of a borough surveyor is somewhat anomalous. His office is of recent creation; his masters are men who, as a rule, are incompetent to understand his duties; his salary is inadequate to his responsibilities, and his tenure of office may depend upon the whims of a few agitators. On the other hand, his knowledge must be almost unlimited, far exceeding that of the architect according to the Vitruvian standard. He may have to undertake, as an engineer, sewerage and sewage utilisation works, water and gas works, canals, docks, harbour improvements, river navigation, the protection of coasts against encroachments of the sea, the prevention of floods by rivers, the construction and maintenance of roads, bridges, and tramways; as an architect he may have to design and superintend the erection of lunatic asylums, municipal offices, hospitals, abattoirs, mortuaries, baths, wash-houses, cemetery chapels, stables, police stations, and other similar works; if there are recreation-grounds, public parks, or cemeteries, he is expected to be a landscape gardener; all kinds of surveying, quantities, estimates, valuation of property, measuring land, laying out streets, are considered to be mere trifles for him, and, like the examination of accounts, to be undertaken in spare moments. Difficult as those subjects may be, they are easy of attainment compared with the diplomacy which is requisite to enable the surveyor to go through council and committee meetings. Many a borough engineer would rather prefer to spend his day in laying out drains than in attending the council chamber. Contractors and navvies are often exasperating, but for taking the life out of a man they are not equal to the guardians of the public interests that are to be found on every local board. Yet, in spite of the difficulties and risks attending the office, every advertisement for a borough surveyor attracts an immensity of candidates—it is supposed that the number of them corresponds with the number of pounds sterling in the salary. It is possible that the peculiarities of the office have attractions for some minds, and that young men of combative tendencies anticipate pleasure in the "scenes" in which the surveyor has to participate, and a good deal of the delight of battle may be found in overcoming the pretensions of obstreperous rate-payers.

Mr. BOULNOIS is one of the borough engineers who have successfully held their position, and he inspired so much respect for his courage, efficiency, and impartiality that the good people of Exeter—many of whom may have at one time regarded him as an enemy—actually presented him with pieces of plate and other substantial memorials on his departure from among them. A man who has been so victorious is well fitted to give advice to aspirants. If Mr. BOULNOIS was successful, it was owing to the fact that he knew his business and practised it fearlessly. He, therefore, gives in his book suggestions which relate to conduct as well as those which refer to technical matters. Thus, for example, punctuality in attending committees is enjoined, among other reasons, because "the gentlemen who form municipal bodies give their time gratuitously, and everything should be done to save it as much as possible," a sentence which indicates that Mr. BOULNOIS has acquired "the art of putting things," and it is one which is indispensable to an officer who has to deal with opposing interests.

The construction and maintenance of streets form an important part of the surveyor's duties, and Mr. BOULNOIS devotes several chapters to materials, forming, rolling, pitching, kerbing, channeling, &c. In them we find the results of his own experience, as well as the recorded results of other engineers in England and elsewhere, and the advantages and

\* *The Municipal and Sanitary Engineer's Handbook.* By H. Percy Boulnois, C.E. E. & F. N. Spon.

defects of various systems are stated fairly and clearly. Everything is considered, from machine stone-breakers and steam rollers to hammers and brooms. Specimens of specifications for the construction and repairs of roads are given. It is needless to say that the information will be useful to many who are not town surveyors, and such suggestions as those on concrete and tar pavements will be often applicable in covering the surfaces of yards and enclosures.

The model by-laws of the Local Government Board are made the subject of a chapter. The ambiguities of phrases in the clauses are discussed. Thus, for example, "new building" is sometimes defined by the aid of the Public Health Act, in which there is an equal difficulty as respects ground floor. When it said that "the re-erecting of any building pulled down to, or below the ground floor, or of any frame building of which only the framework is left down to the ground floor, &c., shall be considered the erection of a new building," Mr. BOULNOIS asks whether the words mean the actual floor level, or the cubical space contained by the walls, floor, and ceiling of the ground floor or ground storey of the building? The uncertainty has given rise to some sharp practice, so as to make the local authority powerless when old buildings are transformed into new ones. The following is one of the dodges: "Sometimes a so-called repair of a building is commenced by adding a new roof, perhaps, at a higher level than the old one; when sufficient time has elapsed to allay suspicion a new front is erected, and then new back and side walls in due course, the alteration of the interior floors not attracting much attention." Mr. BOULNOIS doubts whether it is possible to prosecute when an old building is gradually converted into a new one, as the complaint has to be made according to the Public Health Act within six months from the time when the matter of the complaint arose. The complaint could not be made when the work was first commenced, as no offence would have been committed, and if made after the work was finished, it might be urged that the offence was commenced more than six months prior. Mr. BOULNOIS says that it is possible in towns for a man to convert stables and warehouses into dwelling-houses, although they may not be adapted for that purpose. He has simply to get some one to prove that they were originally constructed for human habitation, and the Public Health Act, through the unwisdom of the 159th section, becomes an instrument for creating what may be a source of danger.

Mr. BOULNOIS has to admit the inefficiency of the inspection that is now practised in towns. It is impossible for a surveyor, having a multitude of other duties engrossing his attention, and who in some places is without an assistant, to properly examine houses while in course of construction. The by-laws are so stringent that even a honest builder may be forced to evade them. In one respect they are modelled on the Metropolitan Building Act, and sacrifice much to prevent the spread of fire. Mr. BOULNOIS is of opinion that fires chiefly affect insurance companies. He would have every one pay an insurance premium, and let the companies look after their own interests. Life ought to be of as much interest as property, "yet no clause can be discovered in the model by-laws rendering it compulsory to make some provision in dwelling-houses or factories for the easy escape of the inmates in case of fire." Mr. BOULNOIS also is sceptical about the advantages of the large open space at the back and sides of a small house. He has found the space turned into a receptacle for garbage and filth, thus becoming a source of disease to the neighbourhood.

There are many other chapters in Mr. BOULNOIS' book which we should have liked to notice if space were available. It is full of information, is arranged in the way that is best adapted for reference, and is entitled to become a borough surveyor's *vade mecum*.

## PARIS NOTES.

THE Prefect of the Seine has nominated the following gentlemen to be members of the City Managing Committee of Fine Arts: M. Lavastre, in the painting section; M. Falquière, in the sculpture section; M. Ballu, in the architectural section; and M. Chaplain, in the engraving section.

Eugène Delacroix's painting of *The Entry of the Crusaders into Constantinople*, now in the Versailles Museum, is shortly to be brought to the Louvre, where it will hang in the new representative gallery referred to in *The Architect* of last week. This fine work was first exhibited at the 1841 Salon, and reappeared at the 1855 Universal Exhibition. In order to fill the vacant place at Versailles, the Minister of Fine Arts about twelve months ago commissioned M. Charles de Serres to make a copy of it. This is now finished, and will be hung immediately the original is removed.

The City of Paris has purchased from the contractors for the demolition of the Tuileries a large sculptured frieze and two fluted pilasters inlaid with marble, and dating from the sixteenth century. These fragments were formerly placed on the left side of the front facing the Place du Carrousel.

Two statues saved from the wreck of the old Hôtel de Ville—those of Jean Aubry, Echevin (Sheriff) of Paris in 1559, and of Pierre de Violle, Provost of the Paris Merchants in 1553—have been erected in the Square Monge.

On assembling after the vacation the Municipal Council will have to consider M. Lheureux's plans for the rearrangement and extension of the buildings of the Faculty of Law. According to this scheme, which as regards its main features appears to have been very favourably received, the new Faculty would occupy the whole area comprised between the Place du Panthéon, the Rue Cujas, the Rue Saint-Jacques, and the Rue Soufflot. The building that it is proposed to erect on this vast site would contain on the ground floor a large amphitheatre or lecture-hall for 350 pupils, and the upper storeys are to contain the professors' rooms, classrooms, libraries, offices, &c. The cost of putting this scheme into execution is estimated at 1,466,800 frs. for building, and 948,926 frs. for expropriating purposes. Half of the expense would be borne by the State and the remainder by the City of Paris.

The Municipal Administration is so well satisfied with the advantages and wear of the wood pavement laid down by an English company, as a trial, in the Champs-Élysées and the Boulevard Montmartre, that it is about to substitute it for macadam in a number of other leading thoroughfares, among them being the Rue Royale, Avenue de l'Opéra, Faubourg St.-Honoré, and parts of the Rue de Rivoli, and the great boulevards that start from the Madeleine.

The buildings that have been in course of construction along the Rue de Vaugirard during the past two years, in connection with the Luxembourg Palace, are now completed, as far as the exterior portions of the work are concerned. The ground-floor will be occupied by the State printing-office, and the first floor is to be arranged as a sumptuous gallery, whereby the President of the Senate will be enabled in future to walk straight from his apartments into the house, without having, as now, to cross the gardens. It is curious that the two main portions of the palace have never hitherto been in proper communication with each other. Under the Directory a connection was established for the first time by means of a covered passage of temporary construction; but this was soon after pulled down, and the site used for greenhouses, which in turn gave way to the barrack-like buildings occupied by the City Finance Department when the Prefecture of the Seine took up its quarters at the Luxembourg after the Franco-German war. These have now disappeared, and been replaced by the building above referred to, which has been designed in strict architectural accordance with the other parts of the palace.

The City authorities have decided to considerably extend the noble thoroughfare now known variously in different parts of its length as the Boulevard d'Enfer and the Boulevard Edgar Quinet. Several years back the Boulevard d'Enfer enjoyed a great but unenviable notoriety as one of the lowest quarters of Paris; it took its name from the gate and the Rue d'Enfer, named also the Porte and Rue St.-Michel. The gate no longer exists; the original Boulevard d'Enfer has changed its name for that of Edgar Quinet, and the street is known as the Rue Denfert-Rochereau. The new name of the boulevard sticks to it, however, only from the Place

The Postmaster-General has written to the First Commissioner of Works to request him to convey to the officers and surveyors of the Office of Works his thanks for their cordial co-operation in establishing the parcels post, and for their assistance in providing the additional accommodation and appliances necessary for the new service. The Crown post-offices throughout the country have been adapted for the purpose, and upwards of 200 post-offices have been considerably enlarged during the last few months.

Denfert to the Boulevard Montparnasse, just where forty years ago stood the famous *Bal de la Grande Chaumière*; and further on along the line of extension it still retains its old appellation. This line of extension is important both in its direction and length. Starting from the Boulevard Montparnasse, it ends at the angle of the Rue du Bac and the Boulevard St. Germain, traversing in its course the Rues Bréa, Vavin, Stanislas, Notre-Dame-des-Champs, Fleurus, du Regard, de Varennes, and Vaugirard, in all of which sad breaches will have to be made in order to join all the sections of the new thoroughfare. The first portion runs along the present Rue du Regard; another begins at the Square des Petits-Ménages; while the third cuts obliquely through the Rues de Varennes and Grenelle, and comes out into the square near the gardens of the Hôtel de Luynes. Many old and interesting buildings will have to come down during the execution of this thoroughfare, among others the ancient seminary of the Rue Notre-Dame-des-Champs.

### CARLISLE CATHEDRAL.

A MEETING of the Cumberland and Westmoreland Antiquarian Society was held last week. Among the papers which had been prepared for the meeting, but which were not read, were three by the Mayor of Carlisle, Mr. R. Ferguson, F.S.A., but which are printed in the *Carlisle Journal*, on "The Tombs in Carlisle Cathedral." Mr. Ferguson said: Does any record exist showing the positions of the graves or vaults (if vaults they are) in the cathedral of Carlisle? Many persons of importance rest here, but the sites of the graves are unknown; while, on the other hand, there are monuments and grave-covers which cannot be certainly assigned to anyone. Great confusion has been occasioned by the shifting of monuments from their original positions. Thus the monument to Bishop Law commences—

Columnæ hujus sepultus est ad pedem,

and one naturally looks on the ground below as the bishop's grave, but the monument is now at the west end of the north choir aisle, while the bishop lies, we believe, in the choir near the pulpit. If the position of his grave is still known, it ought to be in some way marked. The late Dean Cramer is, we believe, buried in the south aisle, but his monument has been reft from him, and is stuck behind the reredos with a row of others. It is hard to believe that valid reason (architectural, æsthetic, or otherwise) can have existed for this shuffling about of monuments which marked actual interments. We have reason to believe that Lord Ellenborough was much annoyed, on visiting the cathedral last summer, to discover that Bishop Law's monument had been moved away from the bishop's grave. It is now placed close to a huge stove, and, as marble bends and warps under changes of temperature, it must ultimately decay. The one next to it, to Mildred Stanley, is already slightly distorted from the heat of the stove. There is another monument which is perishing for want of care—the magnificent brass bell to Bishop Bell. With the best possible intentions it has been covered up with a rough matting of cocoa-fibre to prevent people from treading on it; through this the dust and sand and dry mud from dirty boots penetrates, and the effect is about equivalent to a weekly scouring with a hard brush and sand. Some quarter of a century ago we made a rubbing of this brass, and can aver that it has gone sadly to the bad since then. Surely some means of affording it protection can be devised. It would be a triumph of archæology to identify the knight and lady with three children commemorated by a fine brass, of which the matrix alone remains, under the west window, clearly not its original site. The matrix of another fine brass is in the choir, a figure in a mantle, possibly a female, hardly a priest. There are two more much-worn matrices of lost brasses. The curious little brass to Bishop Robinson, now on the wall of the north aisle, is not *in situ*; it was, in 1703, behind the hangings on the north corner of the high altar, was long forgotten, and was rediscovered at the end of last century. It is possible the bishop lies there: he was hurriedly buried, for he died at Rose Castle at three p.m., and was buried the same evening at the cathedral at eleven o'clock. Besides Bishops Law, Bell, and Robinson, bishops Smith, Fleming, Percy, and Waldegrave have monuments. Bishop Smith sleeps under his monument, a slab in the floor of the choir, and his wife lies beside him. The monument to Bishop Fleming has been moved away from his grave. Bishop Percy is buried elsewhere, and his monument is the glass in the lower part of the east window. Bishop Waldegrave is commemorated by a cenotaph\* and recumbent effigy thereon. Two recumbent effigies and two arched recesses are assigned to early bishops—Everdon, Welton, Kirkby, and Appleby, but the appropriations are doubtful, and the

authorities differ. Mr. Bloxam, for instance, considers the effigy generally assigned to Bishop Welton to be a hundred years after his time. Bishops Irton, Kirkby, Best, Meye, and Senhouse are all said to be buried in the cathedral, but no one knows where. Stranger still, because we come to more modern days, no one can tell where lie the Lord Dacres of the north. Stranger still is it that the fact of their burial in Carlisle Cathedral is mentioned in no local history, recorded by no tradition. Yet there is no doubt that Lord William Dacre of Gillesland and Greystoke, was buried in Carlisle Cathedral, on December 14, 1563, and his son, Lord Thomas, on July 25, 1566, the bishop officiating, and Lord Scrope being the chief mourner. Lord William's father and grandfather were buried at Lanercost, but, probably owing to the family burial-place at Lanercost being included in grant to Sir Thomas Dacre the Bastard, Lord William and Lord Thomas were brought to Carlisle. One would wish to see these burials recorded in the cathedral by a modest monument. In early youth one used to be taught that the bowels of Richard Cœur-de-Lion were buried before the altar in Carlisle Cathedral. Lysons says it is so said, but cites no authority. Rapin says Cœur-de-Lion's body was buried at Fontevraud, his heart at Rouen, and that his bowels were sent into Poitiers, by way of insult rather than compliment. They may have drifted to Carlisle, brought by some of the De Vaux family, whom he had, I fancy, in his service; but this is conjecture. An arched recess in the south aisle had, until recently, an inscription painted over it in memory of Sir John Skelton. This might well be put up again, as the words are known. The recess would once contain an effigy. Successive reflaggings of the floor account in part for the sites of so many burials being lost; there probably was a reflagging after the Commonwealth, when all broken grave covers would be discarded. This would account for Bishop Nicolson having so little to tell about inscriptions in the cathedral. There probably was another about 1768, when a deal of mischief was done in the cathedral. Prior to that time a puzzling inscription existed under the Bishop's throne, which was read by one antiquary—

Hic jacet Eva quonda uxor  
Willi fil Rogeri,

by another—

Hic jacet Ema quonda uxor  
Willielmi filii Rogerii.

There are still several stained-glass windows in the cathedral by way of monuments, but they cannot be called monuments, certainly not personal monuments, unless they are of a portrait character like that to Chancellor Fletcher, which will some day be valuable as a record of nineteenth-century ecclesiastical costume, but the Fletcher window will hardly be followed as a precedent. As for the other windows, putting aside the one to the Tait children, only the verger and a few aged inhabitants know who they commemorate; who can tell where is the Vansittart window? True, they have inscriptions, either on the glass, or on fillets of brass below, but they are written in characters that only an antiquary can read; and, as the brass fillets are fixed at the eye level of a man eight or ten feet high, he requires a glass to aid his eyes. The last addition to the monuments in the cathedral is well enough, and will be improved when the shine is off it, but the less said about some modern ones the better; nor can we say one word in favour of the brass tablets, which, we believe, the Dean and Chapter affect—poor and paltry, we hope to see no more of them. Rightly the Dean and Chapter keep a tight control over the monuments they admit, and of the persons to whom they are erected. The last that has been erected is a modest monument to Sir Henry Fletcher and his gallant brothers. No man was ever better fitted for such honour as has been done Sir Henry; no such six brothers. One new monument is under consideration: that to him who for twenty-five years ruled over the cathedral, but whose reputation and whose influence extended beyond the narrow precincts of an abbey close, beyond even the broader limits of a diocese; a man who, of ecclesiastics departed during this century, has left the greatest mark on local churches and charities.

In the course of a second paper on the same subject, his Worship said in the north aisle of Carlisle Cathedral was a much battered and ill-treated effigy of a bishop. It had once been part of a magnificent monument; it is of Purbeck marble, and traces of paint and gilding can still be made out upon it, while the *mitra preciosa* and the *rationale* on the breast have sockets which have once been filled with jewels, imitation probably, possibly real. If it could be restored to its original brilliancy he was afraid we should in this æsthetic age call it loud and vulgar. It had been subjected to great violence, and the damage was such that if done by malice aforethought, it must have been done by aid of a sledge-hammer; if by accident by the dropping on it of a heavy weight. Mr. Bloxam, F.S.A., in a description of the effigy, stated that it was said to be Bishop de Everdon, who died 1254 or 1255. The monument was assigned by the eminent antiquary Browne-Willis to Bishop Strickland, who died 1419, but this theory might be dismissed as untenable, as many local historians had pointed out that the effigy was of a much earlier period. It was among the thirteenth-century bishops that we must look for the proprietor of the effigy under consideration. The effigy stood in the choir prior to 1292; it would be deprived of its feet and otherwise battered

\* Cenotaphs were common in mediæval times. There is one to Sir Thomas Warton and his two wives at Kirkby Stephen. The whole three are buried at Healaugh in Yorkshire. Other instances are in Westminster Abbey.

by the falling of the roof. After the fire, damaged and battered, it was shifted into a niche hastily cut in the wall for it, and he rather thought the bishop was re-interred under it. In that niche it lay until the restorers pulled it out. It could not have been part of the mausoleum of the bishop, for that had been totally destroyed, nor could it have belonged to Bishop Chalix, for that was uninjured. Leaving out the other thirteenth-century bishops—Thomas Vipont, Ralph Irton, Bishop Hugh, and Walter Malderk—it only left us Silvester de Everdon, and Silvester de Everdon's effigy he took it to be. Everdon was originally a clerk in the Chancery, afterwards the King's chaplain and Vice-Chancellor, and in 1244 Lord Chancellor of England. Lord Campbell said of him, "he very soon retired from State affairs against the wishes of the King, being elected Bishop of Carlisle, and choosing to devote himself to the superintendence of this remote see." That was all Lord Campbell said of him, which made it probable that he died in the north and was buried in the cathedral.

In a third paper the Mayor said there was no great difficulty in assigning to the effigy in the south aisle its real owner. It was Bishop Barrow, and was always so designated until the late Mr. Mackenzie Walcott blundered into assigning it to Welton, and all recent writers of guides had followed Mackenzie Walcott. This bishop by his will bequeathed some plate to the cathedral and 20*l.* to a priest to sing masses for his repose in the Chapel of St. Catherine, within which the monument really stands, though it is now excluded by the screen having been shifted from the side of the monument on which it originally stood to the other side. The side of the monument to the aisle was until recent years mere rough masonry. Bishop Barrow died in 1429, a date much nearer to that 1469 assigned by Mr. Bloxam for his monument than the death of Welton, which occurred in 1362. Nothing need be said as to Bishop Bell's brass. It was *in situ*, and had been more than once engraved. The brass to Bishop Robinson, who died in 1616, was also engraved. This brass in 1703 was "behind the hangings on the north corner of the high altar." Being hidden behind the hangings the brass was forgotten, until the reredos and altar were shifted by Bishop Lyttleton. It was then taken down and for long laid about loose in the aumbry in St. Catherine's chapel. An old manuscript said—"Bishop Robinson's bones were found enclosed in a lead coffin above ground within a coarse tomb: his remains were buried and the top or cover of the tomb laid upon his grave." There was an arched recess in the south aisle. This Willis marked as the tomb of Sir Thomas Skelton, and represents an effigy as lying in it. He also said that about one hundred years before his time there was painted on the wall an inscription. Willis also said this John Skelton died in 1420. Just west of Sir Thomas Skelton's arch was a matrix in the aisle wall which would hold a brass plate sufficiently large to hold the inscription referred to. But where was Sir Thomas Skelton's effigy mentioned by Willis? He thought it never existed for he only mentioned a tomb in his text. It certainly was not there in 1765. Bishop Whelpdale (Bishop of Carlisle 1419 to 1422), by his will left 200*l.* to found a chantry in Carlisle Cathedral for the souls of Sir Thomas Skelton and John Glaston, who lie buried in the south aisle of the cathedral. Glaston's burial-place was unknown, but Willis conjectured it might be under an unknown monument on the opposite side of the aisle between the third or fourth pillars from the east. This was now gone.

### CHURCH BELLS.

A PAPER on "Church Bells" was lately read at Exeter by Mr. F. Iliffe, Mus.D., in which he said: Not the least revered and cherished amongst the possessions of an ancient city are its church bells. Though far more advanced in years than the oldest and most venerable of all its citizens, they ever maintain the vigorous sympathies of youth, and love to hold intercourse with man, vibrating sometimes to his joys, at others to his sorrows; rejoicing with him as he glories over the victories of his country, and mourning for him when he is himself laid to rest. It is proposed to say a few words on the position and sounds of bells, possibly also to suggest in passing the reason why some peals are more satisfactory and beautiful in tone than others. First, as to position: there is no doubt that the best position for a belfry is on an eminence, or if in a crowded thoroughfare, it should be raised to such an altitude that the sounds can get well away without receiving obstruction from the buildings by which it is surrounded. Strasburg and Antwerp may be quoted amongst others as excellent specimens of belfries, the bells at both these places being perhaps in the best positions it is possible for them to occupy; indeed, at Strasburg some of them may be easily seen, hanging as they do almost outside the ornamental work of the tower. The belfry at Bruges may be mentioned as an instance of one in a bad position—being almost in a hollow—so that the sounds scarcely seem to travel beyond its own level. Our larger belfries are, as a rule, excellently situated in England, and in this we contrast favourably with some of our continental neighbours. In quality of tone, and more absolute correctness of pitch, we are, however, certainly behind them. It has been often

said that very little has been written in books about bells, that it is a subject upon which we have at present only scanty information. This is true, and the reason for it is not difficult to find. The subject however is one of importance, possessing an interest common to all, and it is hoped will not from trifling considerations be allowed to remain in the background. As to the sound of bells, one is sorry to be obliged to say that we in England have so many peals which are not only very indifferent in quality of tone, but are very much out of tune amongst themselves; and that this should be allowed to remain so is the more to be regretted when so much is being done by mathematical musicians to improve and perfect our popular instruments in the qualities just mentioned. Six years ago I was told by an eminent professor of acoustics that I should very soon be required to play the preludes and fugues of Bach on an organ with twenty-four sounds to the octave, *i.e.*, quarter tones; and an instrument built in this manner was exhibited at Kensington a short time ago. This is not the place, however, for me to say more on this point, but why is there no improvement in the founding of our bells? It is impossible to hear the continental bells without being struck with their immense superiority over ours in England, both in beauty of tone and more absolute correctness of tune; in truth, it would not be difficult to mention several well-known English peals which are so discordant that the people of Ghent, Tournay, or Antwerp would have pulled them down the moment they heard them, and yet we live on and on quietly amid all this dissonant clangour. What is wanted, I feel sure, is that the masses of the people as well as the authorities should be keener in this matter, and that they should without scruple at once condemn what is bad or indifferent. Why are our eyes offended at the ugliness of some of our towns? Some will say this has been the fault of architects; or, where architects have not been engaged, it is the fault of the ordinary builders. Doubtless some fault may rest here, but I venture to think the real secret of the difficulty lies in the fact that the masses of the people have not sufficiently sensitive tastes and feelings as yet in these matters, and until they are more cultivated by an appreciation of greater correctness in general design, as well as greater beauty in detail, I was going to say by an insight into the finer arts, we shall not be able to boast successfully of the stateliness of our towns. But to return to bells—every one loves them, from the child who associates them with the merry days of his young life, to the old man in whose weary brain they conjure up bright memories of times gone by. Let us hope, therefore, that greater attention may be paid them, and that the "tide of music's silv'ry sea" may in our church bells be made more harmonious. Let me say, in conclusion, that in writing this unpretending little paper, my object has not been in any way to blame the past. I have been only prompted by a desire to call attention to the somewhat neglected state of a beautiful subject, one full of interest and importance.

### MR. HERKOMER'S NEW SCHOOL OF ART.

A PROJECT which had a simple origin some two years ago in the request of a young lady to become a pupil of Mr. Herkomer, A.R.A., is now about to be realised. Mr. Herkomer did not wish to undertake one pupil alone, but with his characteristic generosity towards students, he intimated that a class formed in his neighbourhood should have the full benefit of any advice he could give. Thereupon the young lady's guardian offered to build a studio for this purpose, but as time passed and matters were discussed the studio scheme was expanded to that of an art school, until to-day within a short time of its opening we have the promise of an art training unique in this country. The modern art movement has flooded the country with institutions, all more or less of the type of the Academy, Slade, and South Kensington Schools, but with these the new school has few points of resemblance. Mr. Herkomer has gained his experience from all parts of the Continent and America; he has studied the systems pursued in their schools, and has noted both their defects and good points. His present plan is not yet fully developed. He has many schemes in his mind, and as he will be the sole responsible head and sole teacher of the pupils, who will gather in the school at Bushey, where he has so long made his home, it only depends upon him to give his students the plan of study best suited to their requirements. So far as he can, he will control the whole tenor of their life whilst under his care. Every one will live at Bushey, and no one will be allowed to join the school for less than nine months. The students will have perfectly free intercourse with Mr. Herkomer at all times of the day; but they will be left at the same time a good deal to themselves. They will pose their own models, and work in their own method, but directly they feel in any difficulty they will be allowed to cross from the school to their master's studio and ask his advice or watch him at work. Mr. Herkomer wants no imitators and no dilettanti. He wants hard-working students who love their art. For this reason he has fixed the fees low, and made no restrictions as to the hours of work. His own advice and assistance will be given for love, and as no salaries have to be paid save those of the models

and porters, the working expenses cannot be very great. Thus for 18s. each student can paint from the model daily from ten a.m. to three p.m., and from seven to nine p.m., throughout the whole nine months, and can use the studios all day through if wished, whilst without any additional expense the studios will be thrown open during the entire three months' holiday to any who, having good designs of pictures, have no studio wherein to execute them. Life-size studies will be chiefly encouraged, and, as canvases when large are expensive, Mr. Herkomer has exercised his forethought in this direction likewise, and hopes to be able to make arrangements for the sale on the premises of all necessary painting materials at the lowest possible rate. The schools are large and well built for their purpose. Entering through some cloisters designed by Mr. Herkomer, one passes to a long corridor communicating with the various studios, and closed at the end by a large sheet of plate-glass which permits an extended view of the slopes and hills around. Each studio is of such a size that every one painting can have an equally good view of the model. The room at present set apart for the male students has a fine oak panelling round its lower walls, and a magnificent piece of antique wood-carving nearly covering one side; whilst the light admitted from the side, at a great height, produces a solemn and mellowed effect. The ladies' studio has both a top and side light, and at times the male and female students will change about, to get different effects of light. A smaller studio opposite, intended for experiments of light and for minute work, has not only a double-top light of sloping and flat ground-glass, but projects into a triangle entirely fenced in with ground-glass from floor to roof, to give the opportunity of painting the nude figure entirely surrounded by light. All the flooring is laid on a foundation of concrete two feet deep, and the warming and ventilation are both well arranged. Electric light will be used as soon as a perfectly steady flame is obtainable. Beyond the studios are porters' rooms, models' bedrooms, and smaller rooms for hats, cloaks, and the studies of the students, whilst a special feature of the school is a specimen gallery which will always be open to receive the works of contemporary artists which Mr. Herkomer hopes to borrow from time to time. A few casts will be placed about the rooms, though the students will only work from the life and the landscapes around. Both the men and the women will have equal advantages, for, although Sir Frederick Leighton refused a nude class at the Academy schools for ladies, on the ground that their want of imagination afterwards rendered the class useless, Mr. Herkomer has too keen an appreciation of Rosa Bonheur's genius to deny that the training might prove useful. Nothing that he does himself will be kept from the students; his paintings can be seen day by day, and all the processes connected with etching, mezzotint, copper and steel engraving, and the casting of his designs in bronze and silver, which are one and all carried out close to his studio, will be open to the study of the Bushey artists. Their number Mr. Herkomer has limited to sixty, as he wishes to know and help each one individually. He has had many applications for admission already; but as he is rather inclined to begin with a still smaller number, the selection of the first pupils will be very rigid, and only those of great promise are likely to gain admission. Those who are still wishing to be amongst the first must send in a drawing of a nude figure from the life; or, if landscape students, of a landscape from nature and a head from life, during this month or next, when the final selection will be made. Strangely enough, during his recent visit to the United States, so much interest was evinced in the projected school that had Mr. Herkomer so wished he could have commenced his first term with his school full of Americans alone.

### REGISTRATION OF DESIGNS.

THE new Patent Act consolidates and amends the law relating to the registration of designs, and affording copyright therein. The word "design" and "copyright" are defined as follows:—

In and for the purposes of this Act design means any design applicable to any article of manufacture, or to any substance artificial or natural, or partly artificial and partly natural, whether the design is applicable for the pattern or for the shape or configuration, or for the ornament thereof, or for any two or more of such purposes, and by whatever means it is applicable, whether by printing, painting, embroidering, weaving, sewing, modelling, casting, embossing, engraving, staining, or any other means whatever, manual, mechanical, or chemical, separate or combined, not being a design for a sculpture, or other thing within the protection of the Sculpture Copyright Act of the year 1814 (fifty-fourth George III., chapter fifty-six).

Copyright means the exclusive right to apply a design to any article of manufacture or to any such substance as aforesaid in the class or classes in which the design is registered.

The author of any new and original design shall be considered the proprietor thereof, unless he executed the work on behalf of another person for a good or valuable consideration, in which case such person shall be considered the proprietor, and every person

acquiring for a good or valuable consideration a new and original design, or the right to apply the same to any such article or substance as aforesaid, either exclusively of any other person or otherwise, and also every person on whom the property in such design or such right to the application thereof shall devolve, shall be considered the proprietor of the design in the respect in which the same may have been so acquired, and to that extent, but not otherwise.

The Act provides that the Comptroller of Patents may, on application by the owner, register "any new or original design not previously published in the United Kingdom." The application must "contain a statement of the nature of the design, and the class or classes of goods which the applicant desires that the design be registered." The same design may be registered in more than one class; and in case of doubt as to the class in which it should be registered, the Comptroller may decide. He may also refuse to register any design offered for registration, but from his decision an appeal may be made to the Board of Trade, which "shall, if required, hear the appellant and the Comptroller," and may then make an order, determining whether, and on what conditions, if any, registration is to be permitted.

When a design is registered, the registered proprietor shall have copyright in it for five years from the date of registration. But, before the "delivery on sale of any articles to which a registered design has been applied," the proprietor must furnish the Comptroller with "exact representations or examples of the design," or his name may be erased from the register; and before selling articles to which the design is applied, he must cause each article to be "marked with the prescribed mark, or with the prescribed word or words or figures, denoting that the design is registered," and if he fails to do this "the copyright in the design shall cease," unless the proprietor shows that he took all proper steps to ensure the requisite marking.

During the term of copyright the design is not to be open to inspection by anyone but the proprietor, or a person authorised by the Comptroller or the Court; but, when copyright has ceased, the design may be open to general inspection. If a registered design "is used in manufacture in any foreign country, and is not used in this country within six months of its registration in this country, the copyright in the design will cease." A register of designs is to be kept at the Patent Office, and is to contain names and addresses of proprietors of designs, and notifications of assignments of such designs. The fees payable for registration and all other matters under the Act, are to be prescribed from time to time by the Board of Trade. Exhibition at a certified industrial or international exhibition, prior to registration of a design, is not to hinder the proprietor from applying for registration, providing that such application is made within six months from the opening of the exhibition, and that the proprietor has given the Comptroller notice of his intention to exhibit.

Piracy of a registered design, or the use "for the purposes of sale" of "any fraudulent or obvious imitation thereof, in the classes of goods in which such design is registered," is declared to be illegal, unless the consent of the owner has been obtained, and for "every offence" a penalty of not more than 50s. may be recovered, or the proprietor may bring an action for damages.

### THE LATE MR. BUNNEY.

A LETTER has been addressed by Mr. Ruskin to Mrs. Bunney with regard to the fund collected for her benefit. In it he says: "I am honoured in receiving from the subscribers to the fund which has been collected in memory of your husband a charge to convey to you such expression as may be possible to me of the feeling in which it is presented to you for the fulfilment of his wishes, as you may judge fittest, in the education of his children. I have called it a memorial fund; but, indeed, the subscribers recognise that Mr. Bunney's name will remain ineffaceably connected with the history of all efforts recently made in Italy for preservation of true record of her national monuments; nor less with the general movement, in which he so ardently and faithfully shared, for the closer accuracy and nobler probity of pictorial—more especially of landscape—art; a movement which was initiated about the time when he first took up his residence in Venice, and of which he remained, to the day of his death, the most clearly recognised exponent and representative to the foreign schools, both of Italy and America. This fund has been collected, therefore, not, as is too often the case in such efforts, for the idle inscription of a name which would otherwise have been forgotten, but, trusting your husband's just fame to the lovers of Venice, it is presented to you as a token of the solemn affection in which all we his friends hold, and with which we shall always think of, a man whose careful art was the constant and unstinted enthusiasm of an entirely pure, loyal, and rightly religious soul. And I pray you, madam, now and always, since you know me one of your husband's chief mourners, so also to hold me one of your most devoted servants, J. RUSKIN." The sum handed to Mrs. Bunney by Mr. Ruskin was 673*l.* 13*s.* 6*d.*

## NOTES AND COMMENTS.

It is astonishing how well Mr. RUSKIN'S books keep their high prices. A set of the "Modern Painters" is not to be had much under 30*l.*, and small books like "The Elements of Drawing" and "The Two Paths" are at least thirty shillings each. "The Political Economy of Art," which was published for half a crown, is commonly sold for a guinea. The "Selections from Mr. RUSKIN'S Writings" are valued at five times the original price. From six to ten shillings are asked for a number of the *Quarterly Review* containing the review of Lord LINDSAY'S "Progression by Antagonism," or one with the review of Sir CHARLES EASTLAKE'S book on the "History of Painting." But it may be doubted whether the people who pay those prices condescend to read a page of one of Mr. RUSKIN'S books.

GLASS pipes are now substituted in many chemical works for the earthen or pot pipes hitherto employed for the conveyance of hydrochloric acid gas from the furnaces to the condensers, and, being impervious to acid, are found to last longer than those formerly used. The clay pipes exposed to hot acid gases are often destroyed in less than six months, whereas the glass pipes remain unaffected. They have another advantage, as they cool the gases more rapidly than the thicker clay pipes, and condensation is consequently more completely effected.

BUILDERS rarely take actions against architects, and the failure of a Scottish builder in the Aberdeen Sheriff's Court to uphold an action may possibly suggest to others the inconvenience of litigation. This builder contracted to execute the carpentry in a cottage for an Aberdeen architect; he received three instalments, but he declined to complete the work unless a fourth was paid. The architect of course declined, but offered to pay the entire balance as soon as the contract was finished. The builder had recourse to his lawyers, which necessitated an action on the part of the architect to compel him to complete his work, and for damages on account of the delay. A referee declared that the contract had not been completed, and the builder was obliged to do his work. Then came the question of expense. It so happened that the contract deed did not specify in what proportions the money was to be paid. The Sheriff had therefore to consider the custom in such cases, and he decided that as two-thirds of the amount had been paid, it was neither inequitable nor unreasonable to withhold the balance until the work had been carried out. The builder has been compelled to pay half a year's rent of the house as damages for his delays.

THE Local Government Board have considered it to be expedient at the present time to urge the destruction of unsanitary dwellings. By the Act of 1868 the medical officer of health is required to inform the sanitary authority of the existence of every house which is in a condition dangerous to health. The report is to be referred to a surveyor or engineer, who is, in turn, to report upon the cause of the evil, and to state whether the evil can be remedied by structural alterations, or whether the premises must be demolished. A building need not be unfit for human habitation to be considered dangerous. It may be an "obstructive building"—that is to say, if by reason of its proximity to other buildings it stops ventilation, or conduces to render other buildings unfit for habitation, in such case it is to be reported on as if it were a building of the worst class. Those powers may be exercised not only in towns with a population of 10,000 and upwards, but in all urban sanitary districts. Wherever there is an energetic medical officer to take the initiative much can be done to remove dangerous buildings. His action would now have the sanction of the Local Government Board.

THE name of BEWICK will always command respect in England, although his style of wood-cutting has long become obsolete. The art has passed through many revolutions since his time, and artists now endeavour to gain a breadth in illustrations that was impossible with the regular lines and prim treatment that are to be seen in BEWICK'S figures of birds and in his tail-pieces. A man would fail to find employment who revived that style of work; nevertheless BEWICK'S cuts are in request in this country, and especially in the United States. There is now a fear among the collectors that the value of their impressions may be greatly diminished. It is possible that before long there will be an

abundance of impressions in the markets. By the death of Miss BEWICK, the blocks which that lady guarded so religiously have become saleable products, which the executors must convert into money. Miss BEWICK received many offers for them, but she declined to sell or to lend the blocks. The number of impressions that have been taken from them cannot have injured their surface, and, with careful printing, impressions might be obtained equal to those which now are so expensive. The Americans will endeavour to secure BEWICK'S blocks—and large prices will have to be paid for them—but a publisher would be incurring great risk who imagined that they would serve as illustrations in books for the general public. There must be another revolution in art to make BEWICK admired by the million.

THE most primitive bridge in England is to be found over the river Barle, near Exmoor, in Somerset. It is of the rudest construction, and if stepping-stones are taken to represent the first stage in structures for making transit easy, the Barle bridge may be accepted as the next stage. It is 180 feet long, 5 feet in width, and the slabs are 6 inches thick. When the water is at ordinary height, the bridge is about 3 feet above it. Local traditions, which ignore evolution, have ascribed the wonderful work to the Evil One, and it is one of the so-called Devil's Bridges in Great Britain. But there is nothing supernatural about the stones, and it is simply the work of some primitive villagers.

SOME archæological discoveries of a curious and interesting nature have lately been made by a M. MOREL, in the neighbourhood of Nyons (Drôme). After long excavating in the fields where, from the previous discovery of the remains of a Gallic warrior interred with his arms and war chariot—which figured in the 1878 Paris Universal Exhibition—he had reason to believe he might find further relics of the Gallic period, M. MOREL, at a depth of 6 feet below the surface, came across a Roman chamber, paved with mosaics. This room appears to have been approached by a small porch, pieces being found of the bases and capitals of some small Doric columns. Among the rubbish were many objects of domestic use; Roman tiles, all fractured, with the exception of one measuring 10 inches by 14 inches; innumerable fragments of black and red pottery, and of *dolea* or wine-jars; a finger ring, some pieces of bronze, carpenters' nails, and several of the large box-wood pins used by the Romans for the hair. The inhabitant of the room possessed, moreover, several mortars of the Auvergne volcanic stone, and must have used sharpening or grindstones of very fine texture, similar to those employed nowadays for the razor, fragments of both of these having been found.

It is generally supposed to be good policy to interpret liberally the sum that is fixed in the conditions of a competition for the erection of a building. Designs which correspond with the money that is proposed to be expended are often said to have little chance of success against designs which, being rich in sculpture and ornament, appeal to the imagination of those who are not aware how much work of the kind must cost. Who, for instance, could expect to erect in the nineteenth century a town hall for 8,000*l.*, the sum which the Council of Hawick proposed to lay out? It was natural to assume that the Hawick people, if they saw a good design, were likely to be more liberal. But Mr. HONEYMAN, to whom the designs were entrusted, resolutely took his stand upon finance. He evidently believed that the first question for him to decide was, How many of the competitive plans can be carried out for 8,000*l.*? We are not surprised to find from the report that, under the circumstances, there was only one plan eligible. Such a test can rarely be sustained. In the first Glasgow competition for the Municipal Buildings it may be doubted if there was even one which corresponded with the amount of money that was assigned by the Corporation for the building. Yet prizes were awarded. In another notable instance, the competition for the Edinburgh Cathedral, the prize was carried off by a design the cost of which the author himself stated was beyond the sum fixed by the trustees. There will be, of course, a good deal of grumbling at the course taken by Mr. HONEYMAN, and it is a difficult task to fix the cost of a design in the short time that a referee can afford; but it will be admitted there is justice, although of a Rhadamantine kind, in setting aside those designs which are supposed to be more costly than the clients proposed.

## ILLUSTRATIONS.

AN ARAB OFFICER.—A HÂLT.

THE two illustrations of French soldiers are reproductions from two paintings, for which we are indebted to M. E. DETAILLE, who stands first among living painters of military life. The success which attends subjects of the kind in France suggests the question why similar subjects are not attempted by English painters. We have Eastern soldiers who are as picturesque as the French Arabs, but representations of them are not supposed to be attractive to picture buyers; and an English painter would hesitate for a long time before he selected a subject from the manoeuvres at Aldershot.

ENTRANCE FRONT, WESTWOODHAY HOUSE.

THIS illustration is taken from a water-colour drawing, showing Mr. EDIS's work, which was exhibited this year at the Royal Academy.

HIGHFIELD, MOTTINGHAM PARK, KENT.

OUR illustration represents a house now in course of erection for Mr. JOSEPH S. MOYE, the architect to the estate, which extends from Camden Park, Chislehurst, to within a few minutes' walk of the Eltham station. The house is situated near the station, and commands some very picturesque views of the surrounding country. The materials being used are red bricks, relieved by BROWN's ornamental and moulded brickwork, Broseley ornamental and plain tiles, and J. K. COOPER's terra-cotta ridges and finials. The builder is Mr. JOHN GROVER, of Wilton Works, Islington, N.

BUCHANAN HOSPITAL, ST. LEONARDS.

THIS hospital has just been erected at St. Leonards-on-Sea on a plot of ground given by Mr. C. G. EVERSFIELD, at the junction of Springfield Road with the London Road. The ground plan given speaks for itself. On the first floor is placed a convalescent-room, several small private wards, and the bedrooms for the staff. Mr. W. H. MURRAY is the architect, under whom the works have been carried out in a most satisfactory manner by Messrs. ELDRIDGE & CRUTTENDEN, of St. Leonards, the total cost, including boundary walls, fences, &c., being about 2,800*l*.

SEMI-DETACHED HOUSES, EASTWARD HO ESTATE, FELIXSTOWE.

THESE houses have just been erected on an estate laid out for Messrs. BUGG & JOLLY, from plans prepared by Mr. W. EADE, F.R.I.B.A., Post Office Chambers, Ipswich.

The houses stand in an attractive position on the cliffs, and have a fine sea view, commanding the entire sweep of Felixstowe Bay. They are substantially and carefully built of best red Suffolk bricks. The roofs are covered with Broseley plain tiles, and the fittings throughout are of good character. Mr. THOS. WARD, of Felixstowe, was the contractor for the works.

## THE SOCIETY OF ARTS.

THE following prizes are offered by the Council for the year 1883: *John Stock Prize*.—A Society's gold medal, or 20*l*., for the best design from a poem, or from history, or from the Scriptures, prepared with a view to mural decoration. *Benjamin Shaw Prize*.—1. A Society's gold medal, or 20*l*., for the best plan for "obviating or diminishing risk to life in the operations of coal-mining." 2. A Society's gold medal, or 20*l*., for the best plan for "obviating or diminishing risk to life in the manufacture, storage, and transport of explosives." The Council leave it to the competitors to bring the plans under their notice in any way they may think proper, whether by model, written description, or otherwise. *Howard Prize*.—A prize of 100*l*. for the best essay on the "utilisation of electricity for motive power." Preference will be given to that essay which, besides setting forth the theory of the subject, contains records with detailed results of actual working or experiment. The Society reserves the right of publishing the prize essay. *Fothergill Prize*.—A Society's gold medal, or 20*l*., is now offered for the best invention having for its object the prevention or extinction of fires in theatres or other places of public amusement. *Mulready Prize*.—A Society's gold medal "to that student in a school of art in the United Kingdom who exhibits the best drawing from the nude figure, executed in black and red chalk, in the manner so successfully practised by Mulready."

Designs, plans, models, essays, descriptions, inventions, &c.,

intended to compete for any of the above prizes, must be sent in on or before October 31, 1883, to the Secretary of the Society of Arts, John Street, Adelphi, London. Further particulars relating to the prizes may be obtained on application to the Secretary.

## THE EDINBURGH MUSEUM OF SCIENCE AND ART.

THE plans for the completion of the Museum of Science and Art have now, according to the *Scotsman*, been all but finally adjusted, on the footing of making provision in the new wing for the accommodation of the Scottish Society of Antiquaries. In external appearance the west elevation of the completed building will repeat the familiar features of the east end. There will be a corner pavilion, projecting considerably beyond the general line of the main front, and pierced in all its three storeys, on the north and west sides, with square or round-headed windows, the latter separated by detached shafts. To the south of this will extend a range of windowless wall, relieved with panelling, and indicating that the rearward portion of the interior is arranged as a lofty hall, lighted from the roof, corresponding to that now occupied by the natural history collections. On the ground floor of the corner pavilion, a space, equal to that at present appropriated as the lecture-room, will be set apart for the library of the museum. Under Professor Archer's judicious direction there has been gradually accumulating a goodly store of books, bearing on various subjects illustrated in the museum, and embracing, in particular, many valuable works of reference in connection with the fine arts. In present circumstances, it is difficult to find sufficient storage room for these volumes, not to speak of affording facilities for the public use of them. The new library, however, will amply provide, not only for the present collection, but for the acquisitions of many years to come; while, *en suite* with it, there will be constructed a commodious reading-room, in which books not elsewhere readily available may be consulted, under arrangements similar to those in operation at the South Kensington Museum. The two upper floors of the pavilion—reproducing, in size and shape, those in the east wing now occupied by Indian and geological collections—are to be placed at the disposal of the Antiquaries, and will afford for the housing of their archaeological treasures about four times as much space as they can command at the Royal Institution. A portion of the first floor will be partitioned off as the library and council-room of the Society. It has, we understand, been stipulated that both floors shall be entirely shut off from the galleries of the Industrial Museum, and access to both will be obtained from the street by a staircase enclosed in a square tower, which will serve agreeably to diversify the west elevation. The hall running southward from the pavilion will be devoted, so far as regards the ground floor, to the exhibition of machinery, the two open galleries carried round the walls being assigned to specimens illustrative of ethnology and cognate sciences. Between the hall and the existing ground-floor rooms on the south side of the museum there will be found space for a work-room, as also for a refreshment-room, sufficiently large to meet the public requirements. The present spacious refreshment-room will thus become available for general museum purposes; while, on the transference of all machinery to the new wing, the ground floor of the great central hall, now partially occupied with that class of objects, will be allocated exclusively to the constructive arts.

## THE CHATEAU DE CHAMBORD.

THE following description of the Château de Chambord is from an article by Mr. Henry James in the *Atlantic Monthly*:

On the way to Chambord you enter the flat and sandy Sologne. The wide horizon opens out like a great *potager*, without interruptions, without an eminence, with here and there a long, low stretch of wood. There is an absence of hedges, fences, signs of property; everything is absorbed in the general flatness—the patches of vineyard, the scattered cottages, the villages, the children, planted and staring, and almost always pretty, the women in the fields, the white caps, the faded blouses, the big sabots. At the end of an hour's drive (they will assure you at Blois that even with two horses you will spend double that time) I passed through a sort of gap in a wall, which does duty as the gateway of the domain of an exiled pretender. I drove along a straight avenue, through a disfigured park—the park of Chambord has twenty-one miles of circumference—a very sandy, scrubby, melancholy plantation, in which the timber must have been cut many times over, and is to-day a mere tangle of brushwood. Here, as in so many spots in France, the traveller perceives that he is in a land of revolutions. Nevertheless, its great extent and the long perspective of its avenues gives this desolate bocage a certain majesty; just as its shabbiness places it in agreement with one of the strongest impressions of the château. You follow one of these long perspectives a proportionate time, and at last you see the chimneys and pinnacles of Chambord rise apparently out of the

ground. The filling of the wide moats that formerly surrounded it has, in vulgar parlance, let it down, and given it an appearance of topheaviness that is at the same time a magnificent grotesqueness. The towers, the turrets, the cupolas, the gables, the lanterns, the chimneys, look more like the spires of a city than the salient points of a single building. You emerge from the avenue and find yourself at the foot of an enormous fantastic mass. Chambord has a strange mixture of society and solitude. I enjoyed my visit to this extraordinary structure as much as if I had been a Legitimist; and indeed there is something interesting in any monument of a great system, any bold presentation of a tradition. You leave your vehicles at one of the inns, which are very decent and tidy, and in which everyone is very civil, as if in this latter respect the influence of the old *régime* pervaded the neighbourhood, and you walk across the grass and the gravel to a small door—a door infinitely subordinate, and conferring no title of any kind on those who enter it. Here you ring a bell, which a highly respectable person answers (a person perceptibly affiliated, again, to the old *régime*), after which she ushers you across a vestibule into an inner court. Perhaps the strongest impression I got at Chambord came to me as I stood in this court. The woman who admitted me did not come with me; I was to find my guide somewhere else.

The speciality of Chambord is its prodigious round towers. There are, I believe, no less than eight of them, placed at each angle of the inner and outer square of buildings; for the castle is in the form of a larger structure which incloses a smaller one. One of these towers stood before me in the court; it seemed to fling its shadow over the place; while above, as I looked up, the pinnacles and gables, and even the enormous chimneys, soared into the bright blue air. The place was empty and silent; shadows of gargoyles, of extraordinary projections, were thrown across the clear gray surfaces. One felt that the whole thing was monstrous. A cicerone appeared—a languid young man, in a rather shabby livery—and led me about with a mixture of hurry and delay, of condescension and humility. I do not profess to understand the plan of Chambord, and I may add that I do not even desire to do so; for it is much more entertaining to think of it, as you can so easily, as an irresponsible insoluble labyrinth. Within, it is a wilderness of empty chambers, a royal and romantic barrack. The exiled prince to whom it gives its title has not the means to keep up four hundred rooms; he contents himself with preserving the huge outside. The repairs of the prodigious roof alone must absorb a large part of his revenue. The great feature of the interior is the celebrated double staircase, rising straight through the building, with two courses of steps, so that people may ascend and descend without meeting. This staircase is a truly majestic piece of humour; it gives you the note, as it were, of Chambord. It opens on each landing to a vast guard-room, in four arms, radiations of the winding shaft. One of these arms served as a theatre on the occasion on which Molière's "Bourgeois Gentilhomme" was played to Louis XIV. My guide made me climb to the great open-work lantern which, springing from the roof at the termination of the great staircase (surmounted here by a smaller one), forms the pinnacle of the bristling crown of Chambord. This lantern is tipped with a huge *fleur de lys* in stone—the only one, I believe, that the Revolution did not succeed in pulling down. Here, from narrow windows, you look over the wide, flat country and the tangled, melancholy park, with the rotation of its straight avenues. Then you walk about the roof, in a complication of galleries, terraces, balconies, through the multitude of chimneys and gables. This roof, which is in itself a sort of castle in the air, has an extravagant, fabulous quality, and with its profuse ornamentation—the salamander of Francis I. is a constant motive—its lonely pavements, its sunny niches, the balcony that looks down over the closed and grass-grown main entrance, a strange, half sad, half brilliant charm. The stonework is covered with fine mould. There are places that reminded me of some of those quiet, mildewed corners of courts and terraces, into which the traveller who wanders through the Vatican looks down from neglected windows. They show you two or three furnished rooms, with Bourbon portraits, hideous tapestries, from the ladies of France, a collection of the toys of the *enfant du miracle*, all military and of the finest make. "Tout cela fonctionne," the guide said of these miniature weapons; and I wondered, if he should take it into his head to fire off his little cannon, how much harm the Comte de Chambord would do.

From below, the castle would look crushed by the redundancy of its upper protuberances, if it were not for the enormous girth of its round towers, which appear to give it a robust lateral development. These towers, however, fine as they are in their way, struck me as a little stupid; they are the exaggeration of an exaggeration. In a building erected after the days of defence, and proclaiming its peaceful character from its hundred embroideries and cupolas, they seem to indicate a want of invention. I shall risk the accusation of bad taste if I say that, impressive as it is, the Château de Chambord seemed to me to have altogether a little of that quality of stupidity. The trouble is that it represents nothing very particular; it has not happened, in spite of sundry vicissitudes, to have a very interesting history. Compared with

that of Blois and Amboise its past is rather vacant, and one feels to a certain extent the contrast between its pompous appearance and its spacious but somewhat colourless annals. It had indeed the good fortune to be erected by Francis I., whose name by itself expresses a good deal of history. There has been much discussion as to the architect employed by Francis I., and the honour of having designed this splendid residence has been claimed for several of the Italian artists who early in the sixteenth century came to seek patronage in France. It seems well established to-day, however, that Chambord was the work neither of Primaticcio, of Vignola, nor of Il Rosso, all of whom have left some trace of their sojourn in France; but of an obscure yet very complete genius, Pierre Nepveu, known as Pierre Trinquet, who is designated in the papers which preserve in some degree the history of the origin of the edifice, as the *maître de l'œuvre de maçonnerie*. Behind this modest title, apparently, we must recognise one of the most original talents of the French Renaissance; and it is a proof of the vigour of the artistic life of that period that, brilliant production being everywhere abundant, an artist of so high a value should not have been treated by his contemporaries as a celebrity. We manage things very differently to-day.

The immediate successors of Francis I. continued to visit Chambord, but it was neglected by Henry IV., and was never afterwards a favourite residence of any French king. Louis XIV. appeared there on several occasions, and the apparition was characteristically brilliant; but Chambord could not long detain a monarch who had gone to the expense of creating a Versailles ten miles from Paris. With Versailles, Fontainebleau, Saint-Germain, and Saint-Cloud within easy reach of their capital, the later French sovereigns had little reason to take the air in the dreariest province of their kingdom. Chambord, therefore, suffered from royal indifference, though in the last century a use was found for its deserted halls. In 1725 it was occupied by the luckless Stanislaus Leszczyński, who spent the greater part of his life in being elected King of Poland and being ousted from his throne, and who, at this time a refugee in France, had found a compensation for some of his misfortunes in marrying his daughter to Louis XV. He lived eight years at Chambord, and filled up the moats of the castle. In 1748 it found an illustrious tenant in the person of Maurice de Saxe, the victor of Fontenoy, who, however, two years after he had taken possession of it, terminated a life which would have been longer had he been less determined to make it agreeable. The Revolution, of course, was not kind to Chambord. It despoiled it in so far as possible of every vestige of its royal origin, and swept like a whirlwind through apartments to which upwards of two centuries had contributed a treasure of decoration and furniture. In that wild blast these precious things were destroyed or for ever scattered. In 1791 an odd proposal was made to the French Government by a company of English Quakers, who had conceived the bold idea of establishing in the palace a manufacture of some commodity not to-day recorded—possibly of soap or of candles. Napoleon allotted Chambord as a "dotation" to one of his marshals, Berthier, for whose benefit it was converted, in Napoleonic fashion, into the so-called principality of Wagram. By the Princess of Wagram, the marshal's widow, it was after the Restoration sold to the trustees of a national subscription, which had been established for the purpose of presenting it to the infant Duke of Bordeaux, then prospective King of France. The presentation was duly made, but the Comte de Chambord, who had changed his title in recognition of the gift, was despoiled of his property by the government of Louis Philippe. He appealed for redress to the tribunals of his country, and the consequence of his appeal was an interminable litigation, by which, however, finally, after the lapse of twenty-five years, he was established in his rights. In 1871 he paid his first visit to the domain which had been offered him half a century before, a term of which he had spent forty years in exile. It was from Chambord that he dated his famous letter of July 5 of that year—the letter directed to his so-called subjects, in which he waves aloft the white flag of the Bourbons. On the whole, Chambord makes a great impression; and the hour I was there, while the yellow afternoon light slanted upon the September woods, there was a dignity in its desolation. It spoke, with a muffled but audible voice, of the vanished monarchy, which had been so strong, so splendid, but to-day has become a sort of fantastic vision, like the cupolas and chimneys that rose before me. I thought while I lingered there of all the fine things it takes to make up such a monarchy, and how one of them is a superfluity of mouldering empty palaces. Chambord is touching—that is the best word for it; and if the hopes of another restoration are in the follies of the Republic, a little reflection on that eloquence of ruin ought to put the Republic on its guard. A sentimental tourist may venture to remark that in the presence of several châteaux which appeal in this mystical manner to the retrospective imagination, it cannot afford to be foolish.

---

**The Commissioners on Technical Instruction** are now busily engaged in preparing their report, which promises to be a work of considerable magnitude. The completion of it will probably occupy more time than was originally contemplated.

## THE SOMERSET TYPE OF CHURCH.

A PAPER on the "Somerset Type of Church as compared with those of other Counties" was read by Mr. B. E. Ferrey at the annual meeting of the Somersetshire Archæological Society. In the course of it the writer said: Although, as the redoubtable Mrs. Malaprop has said, "comparisons are odorous," I have this evening ventured to have the courage of my opinions in defiance of that lady. In France, Spain, or Italy we are frequently whirled for two or three hundred miles through very flat country with little variety in the trees or crops, and much the same in the architecture, whereas in England there are great changes, even in a short journey of fifty miles. We must, first of all, examine below the surface of the ground, and then find that it is the geological formation which is the mainspring of the changes. Perhaps there is scarcely a single county in England that has greater variety of landscape than Somerset. Look at its most marked natural features—the great ranges of hills. There are the sterile, mountainous, and stony heights of Mendip, the lofty wild range of the Blagdon Hills, the soft-looking wooded Quantocks. Then there is another variety. The peculiar green molehills, island-like, thrown up amid the broad and not inconsiderable alluvial plains like those about Bridgwater, Glastonbury, and Langport; or another phase, the very undulating country, with incessant "ups and downs," in the vicinity of Bath, round Wincanton, and in the neighbourhood of Wiveliscombe.

Though there is some amount of soil in this county suitable for the manufacture of bricks and tiles, I am not aware of many mediæval examples remaining, for the very sufficient reason that admirable building stone of different kinds was always to be quarried bountifully in nearly every part. But at the present day the Bridgwater tiles, bricks, drain-pipes, and pottery have attained good reputation, as also those at Pool, near Wellington, manufactured, I believe, not longer ago than some ten or fifteen years, and those worked at Weston-super-Mare. If the ecclesiastical or other architecture of the different English counties is examined, it will, as a rule, be found, and very intelligibly too, that where the best building stones are available there is the best architectural type. Glancing at the far north, in Northumberland and Durham, we have the beautiful stone of which Durham Cathedral and Hexham church are built, and the splendid sandstone of Morpeth. Yorkshire possesses a grand array of building-stones (a rival to Somerset in that respect), different, however, in composition, as they are mainly sandstones and magnesian limestones, not oolites. There is the Benedictine Whitby Abbey, built of Whitby crag moonstone, much used in the county, and the glorious assemblage of abbeys principally of the Cistercian order, as well as many fine parish churches. Lincolnshire has its warm-coloured Ancaster stone, an oolite, besides an abundant supply in the neighbouring county of Nottinghamshire, with its remarkable group of limestones and sandstones at Mansfield. Derbyshire has its magnesian limestone at Bolsover, and the millstone grits. There is Northamptonshire, with the beautiful freestones of Barnack and Ketton, the possession of which must have encouraged the growth of the fine series of parish churches, generally crowned with spires. In Bedfordshire are also many fine churches built of the Totternhoe limestone—a beautiful fine-grained stone, and a material much used in the midland counties, but which, unfortunately, has not stood the test of weather, and is best employed internally. There is the Douling stone, used at Wells Cathedral and Glastonbury Abbey, a wonderfully durable material; Ham Hill, ruddy-looking in its youth, calm-looking and gray, covered with lovely-tinted lichens, in its old age; the red sandstone of Bishop's Lydeard and that neighbourhood; the sober-coloured blue lias, too often, alas! treacherously undurable if not properly selected; the excellent blue lias paving-stones and steps of Keinton, Street, and Pennant, the latter being quarried near Bristol. Again, there is the white lias, such as is found in the railway cutting between Wells and Shepton Mallet, resembling Caen stone in its white colour and texture. This is the stone employed in the sculpture of the arch mouldings to the west front of Wells Cathedral, instead of Douling. Last, not least, that rich purplish-red conglomerate, or pudding-stone, called Draycott, which will take a half-polish like marble, and the semi-freestone of Wedmore. Here certainly is a goodly list for one county.

The manner in which Mediæval churches were adapted to the soil (appearing to grow out of it) and to their surroundings is admirable. In chalk districts, such as a large portion of Hants, Wilts, or Sussex, it is the exception to see a richly ornamented building, with elaborate panelled parapets and pinnacled tower. In many parts we observe a wide expanse of open country, a kind of undulating table-land with few trees and hedges, the timber being confined to the hollows or combs where the streams run, or oftentimes surrounding the churchyards. From among the foliage peeps out the quaint unpretending fane in which our forefathers worshipped, the tower in these counties frequently with a plain, unpierced parapet, and a pyramidal tile-covered capping or gray oak-shingled spire. How widely different to this county, which, with all its lovely scenery, has no chalk in its borders, so that the picture of such a church as I have endeavoured to shadow forth to your minds would look curiously out of place.

The Dorsetshire churches approach the Somerset type in the bodies of the buildings, but in respect of the towers are certainly not so fine, though of the same great period—the Perpendicular. The low-pitched, lead-covered roof, with tie-beams filled in with rich tracery above, and the panelled parapets, are characteristic of both counties. Progressing still further west, the county of Devon is reached, where, as a general rule, the churches are smaller and less interesting. The grand tower also to a great extent disappears. But there are several points of similarity to this county. The waggon-headed ceiling, with its carved bosses; the richly-panelled or carved bench-ends, and the rood-screens, often painted. In freestones used in building Devon is not so rich as this county, either in extent or variety. Beer stone, of which Exeter Cathedral and many other fine buildings are constructed, is the most important. Granite is also used, and, naturally, has had the influence of making plain churches, while in the neighbourhood of Plymouth the celebrated marbles are quarried, which, however, have not had much effect on the architecture of the middle ages. In the north-west part of Somersetshire a peculiar type of small carved capital is seen, exceedingly like that of Devon, generally of late fifteenth or even sixteenth-century work. Sculptured figures of angels to each cardinal point of the capitals frequently occur, each bearing emblems of the Passion, or perhaps some musical instrument.

The Cornish churches have several points of resemblance to the Somerset, and here I must beg pardon if I repeat what has, no doubt, been said much better by others about its remarkable churches. Like the buildings of this county, earlier churches were cruciform, built of sandstone; the later ones, erected during the same period, when so many Somersetshire ones were commenced, are built of granite. In plan, the normal fifteenth-century Cornish church takes a considerable departure from this county, and is certainly monotonous. There span-roofed aisles of nearly equal width, prolonged from the west to the east (the latter walls frequently flush the whole width), constitute a plan not equal to the more usual Somersetshire type. Indeed the lead-covered aisle roof of low inclination, with parapet, affords more variety than the compass-shaped roofs with eaves of many of these Cornish churches. The nave and chancel being generally under an unbroken continuous roof, the effective feature of a chancel arch is wanting, though its place is to some extent supplied by an oak rood-screen. The roofs of the Cornish churches internally are not unlike a type of the Somersetshire, the collar-beam trusses, with curved braces under, and the waggon-headed ribbed and panelled ceiling. In some parts of Cornwall, the Mediæval architects seemed to have endeavoured to emulate their brethren here, regardless of the fact that they had to deal with a very different substance to the facile working stones of Somerset. At Launceston church and in the parish church of Truro, parts of which I believe are now being incorporated in the new cathedral, many granite blocks placed externally are carved in an extraordinary way with foliage, scarcely an atom of plain surface being left. The ornamentation cannot be called diapering, for although the same pattern is oft repeated, there are considerable minor variations in the design. I was much struck with this feature in Cornish architecture. In its external roof covering, Cornwall has a decided advantage over many other counties. It possesses a good durable slate of pleasing gray, or sometimes grayish-green hue, and of small sizes, so that the eye is not offended by the large cold blue Welsh slate. The Delabole slates attained their wide reputation years before the Welsh and Westmoreland slate became so much employed, and are much used at the present day. In consequence of some superstitions and its sunless aspect, the northern part of the churchyards, as we know, are usually devoid of graves. I must, however, mention an exception, in the case of Portishead church, where, I was informed, when examining the building a few years since, that the large number of graves on the north side were those of poor shipwrecked creatures whose bodies had been washed ashore.

Let me now endeavour to draw attention more particularly to the architecture of the county wherein we are assembled, still keeping in mind the title of my paper—a comparison. There can be nothing more beautiful and effective than the cruciform plan of many of the earlier churches before the great wave of the Perpendicular style swept over the country. We there see the pleasing contrast of light and shade caused by the projecting arms of the transept with the appropriate finish (at the intersection or the crossing) of the central tower, the almost invariable accompaniment in England of this form of church. However beautiful the later developments of the architecture of the fifteenth and sixteenth century may be, their forms cannot rival this cruciform plan. Sometimes we find the remains of the earlier plan enclosed and incorporated in a larger church of a later period. I have already mentioned the western gable turret so usual in the churches of North Wales and in several English counties, but which is very rare here. As far as I am aware it is generally met with only in the form of a sancte-bell cot over the east gable of the nave, as at Long Ashton church and several others visited by this society in 1881, where it appears to be a localism. The grand Somerset towers, with their characteristics, have been almost exhaustively treated of by Mr. E. A. Freeman and others.

Of the towers of distant counties, perhaps the Norfolk examples most nearly approach them with their pinnacles, though generally inferior in height and size, and of plainer detail. As Mr. Freeman has said, "The west and lateral towers in Somerset and Northamptonshire are rarely octagonal from the ground, almost always having a square portion. But," says he, "the square part in the former county is felt to be a mere base to the octagon, while in Northamptonshire the octagon is a mere finish to the square." This is happily put. They are certainly a feature in some parts of Somersetshire, anterior to the period of the great Perpendicular towers. In other counties they are quite the exception. Somerton, Barton St. David, and Weston-Bampfylde, near Sparkford, are good specimens of this type. As Mr. Freeman has admirably expressed it, speaking of the Northamptonshire spire and the Somerset tower, "The comparison, indeed, lies between the equal forms of beauty, the tower being the perfection of dignity and the spire the perfection of elegance." In this county I do not know a single instance of the gabled or saddle-back tower. The form is rare in England, though usual enough in the north of France, and the specimens are generally small and plain. I hear that they are sometimes found in the south of Northamptonshire and on the coast of Sussex. I know one or two examples in North Wales. The round form of tower also had no following in Mediæval Somerset. There are isolated examples in Essex and Berkshire, and of course there are many in Norfolk, as also in the neighbourhood of Lewes, which was connected with Castle Acre, Norfolk. The form will thus be accounted for, and is certainly suitable to a locality where freestone is scarce. In many of the towers the stair-turrets are a conspicuous decorative feature externally, giving variety to the general effect. In counties where there is little freestone, but where oak was abundant, as at Whitchurch church, Hampshire, the stair-turret is of that material, standing inside the tower just clear of the walls, and picturesquely treated, the enclosing framework being perforated and ornamentally cusped. While on the subject of turrets I may instance the lofty octagonal rood-stair turrets existing in this county, which are not so prevalent elsewhere, as well as the square-edged slightly projecting rood-turret, gabled at the top, as at Portishead church, the greater portion of the steps being in the thickness of the wall.

There are evidences in many a church of the former existence of rood-lofts and screens, numbers of them happily still standing. The splendid range of clerestories, two windows to each bay, so common in Norfolk, is very exceptional in this part of the world. There is a brilliant exception to this at Congresbury church. The perforated stone panelling to the bell-chamber windows of towers instead of oak louvres is a very charming and well-known feature of the Somerset churches, almost peculiar to them, though it is to be sometimes met with in Dorsetshire. Another characteristic of the fifteenth century here is the panelled arch and pier, scarcely ever occurring to the nave arcade, but very often to the tower or the chancel arch, sometimes to the arches separating the chancel from its chantry chapels. One of the best and boldest specimens in my experience is that to the tower arch at Evercrech church. The kind of vaulting, approaching to fan-tracery, in the ground storeys of towers and in porches is a characteristic. The pierced parapets are another peculiarity. The waggon-headed ceiling is common also to Devon and Cornwall. The trussed rafter roof, with curved braces and moulded purlins, is more prevalent in this county than any other; the tie-beam principals, with pierced ornamental panels, are found here and in Dorsetshire. The nearly flat ceiling, with massive moulded ribs, divided and subdivided into panels, with elaborate carving and enriched cusps, deeply recessed, is found to perfection in the nave aisles of Bruton church and Kilmersdon church, near Radstock, and is quite characteristic of Somersetshire. In the nave aisles of Yatton and South Petherton churches are responds, or attached columns, next the outer walls, carrying the roof trusses, a rare feature where there is no vaulting. In the window tracery I cannot say that either in the earlier or later style does Somerset hold any position very superior to other counties. Roofs of stone, forming the external roof and ceiling also, are uncommon in England, though more usual in Ireland and in Spain. There are examples at the porch, Leverington church, Norfolk, and at Barnock church, and a few others. Abbotsbury chapel is an instance in the neighbouring county of Dorset. The only instance I am aware of in Somerset is to an interesting chantry chapel or aisle to the north side of Limington church, near Ilchester, of the fifteenth century. Even in churches of the Decorated period there is no Somerset example that has the profuse ball-flower ornamentations to be found in parts of Herefordshire, at Leominster, and in Gloucestershire, which gives a very rich effect to the building. This characteristic ornament of the Decorated style appears there in the door and window-jambs, in the cornices, eaves courses, &c., studding them all. I have already contrasted the Somerset and Northamptonshire church, but for one moment would draw attention to the remarkable window in the interesting church of Oundle, in the latter county. It is of the Early Decorated period, very long and narrow—in fact, singularly un-English in its proportions (though in all other particulars English), more like German or French work. Its originator may have been abroad and brought back just a fleeting impression of foreign detail. Somersetshire is unusually rich, compared with

other counties, in Mediæval stone and wood pulpits, as might be expected from the preponderance of the churches built during the Perpendicular period. Some have the remains of the ancient colouring upon them, as at Cheddar. Stoups or benaturas are not infrequent, being either in the south porch or attached to the west doorway, if that was more used and nearer the town or village. In floor-brasses, Somerset and other western counties have to yield the palm to the east of England. It is one of the great advantages of the later churches that the wood-fittings are so complete. In a thirteenth-century building this is not the case. Screens, bench-ends, and such like adjuncts, which so warm up and brighten the fifteenth or sixteenth-century structure, are not present. There is, of course, considerable archaeological and historical interest in works of several dates in a church, but an architectural completeness in an entire building finished in one style, as in many Somerset churches. I have obviously but touched upon the fringe of the very small part of the large subject selected for this essay, but trust it will be sufficient to show the value of comparisons. I cannot better conclude than by quoting the beautiful words of St. Chrysostom, "The Church, the Home of the Angels, the Audience Chamber of God, and the Image of Heaven."

### THE HAWICK TOWN HALL COMPETITION.

THE following is the report submitted by Mr. Honeyman F.R.I.B.A., to the Council on the competitive plans:—

*To the Provost, Magistrates, and Town Council of Hawick.*

Gentlemen,—Having in compliance with your request carefully examined the competitive designs for the proposed new municipal buildings for the burgh, I beg to submit the following report:—

Designs have been received from twenty competitors, some of whom have sent alternative elevations and others alternative plans and elevations. Three have sent designs under the same motto—"Teviot"—and these have been distinguished as "Teviot" No. 1, No. 2, and No. 3.

In preparing these designs competitors have had to face two considerable difficulties, the one arising from the peculiarities of the site, and the other from the smallness of the sum to which by the conditions they were restricted, and the first of these has been much more successfully met than the last. The majority of the plans are good, and some show great skill and ingenuity in their arrangement, and marked ability in their architectural treatment; but on the other hand it is evident that the majority of the designs would greatly exceed the limit of cost. I am not prepared to say that any one of them could be carried out, with structural and architectural details suitable for such a building, for the sum named, 8,000*l.*, even if a liberal interpretation be put on the phrase "incidentals" in the fourth condition. Several competitors, however, nearly approach a margin of excess which might be regarded as permissible; and among these I may mention the authors of the designs having the mottoes "Teviot" (No. 3), "Branksome," "Teviot" (No. 1), "Teviot" (No. 2), "Delta," and "St. Cuthbert." Only one, however, has in my opinion succeeded in keeping within that margin, namely, the author of the design bearing the motto "A. B. C.," and as he has produced a very excellent design, fulfilling all the specified requirements with a completeness and convenience of arrangement unsurpassed by any of the others, and distinctly superior to most of them, I have no hesitation in awarding him the first place in the order of merit.

An admirable design has been submitted with the motto "Experto Crede," and the designs having the mottoes "Iona," "Municipal," "Teviot" (No. 3), and "Branksome" have also some excellent features; and it is with extreme regret that after most careful consideration, and under a deep, I may say painful, sense of my responsibility in the matter, I find myself compelled to recommend that these should be excluded from the competition. The designs having the mottoes "Nil Desperandum," "Utility," and "Fitness" violate another condition by occupying more than the prescribed extent of ground, and the author of "Eildon" has mistaken the slope, and arranged his buildings as if the High Street were at the highest point.

In these circumstances, the design with the motto "A. B. C." alone substantially fulfilling the conditions of the competition, I am unable to award the second and third premiums; and I cannot recommend the public exhibition of the designs.—I have the honour to be, gentlemen, your obedient servant,

JOHN HONEYMAN.

140 Bath Street, Glasgow: August 23, 1883.

**The Total Expenditure on Building Operations** in Winnipeg up to date this year—or during little more than half the building season—amounts to 359,870*l.* During the whole of 1881 the expenditure was less than 400,000*l.*, and during 1882 it was under 800,000*l.*

## CEMENT WORKS.

IN the inspections under the Alkali Works Regulation Act a good many difficulties have arisen as to the meaning of cement works, and it seems impossible to decide without some arbitrary line being drawn. The Act mentions aluminous deposits. Now, it is true that aluminous deposits of the Thames and other rivers were chiefly in the minds of the framers of the Act, and such deposits are no doubt offensive when burned. But a question has arisen, What is an aluminous deposit? Is common clay from a considerable depth, and of formation altogether out of historic time, to be included under this aluminous department? The officers say that the only conclusion to come to was that, if it gave out any burning and offensive smell, it ought to be included under the Act. Again, there is the case of lias limestone, which includes a considerable amount of alumina, and cements which contained from two or three to ten or twelve per cent. The practice has been to send for specimens of the stones or other material used, and to analyse them. Generally there has been more than one kind of limestone employed in the manufacture, and if any of these have given out on combustion any offensive vapours, sulphurous gases, or others, the chief inspector supposed them to be included under the Act. Dr. Angus Smith says he does not know a better way, and hopes it is considered a legal and proper method. There has been no rule framed with regard to the cement works, and it is the part of the inspector to obtain a rule by some method after experience. The provisional order in this case which Dr. Angus Smith would propose is this, that there should be no more cement works made with the low conical or open kiln; that after one or two years all at present in existence shall cease to exist. It is considered that this will get rid of a very large amount of offensive gases; also that the chimneys should not be less than 120 feet high. In some cases it may be advisable to increase this height, as, for example, when there is high ground in the neighbourhood. It may be also advisable to have power to insist on methods of diminishing the amount of visible matter in the vapour by increasing the space for depositing the solids; and if this were found insufficient, of insisting also on a certain amount of smoke-washing, a process gradually becoming more practicable. Dr. Angus Smith also suggests that no salt water shall be used in the mixing of lime and aluminous bodies, but whether this would be too great a hardship in some cases has not been ascertained. That there are other cases where such a rule ought to be stringent whenever the vapours from the works are so near habitations as to become very offensive, is said to be very certain. The study of some of these works is very difficult, because the visits take a long time.

The following regulations for cement works are recommended, but have not yet been adopted by the Local Government Board: Cement works of the old form—namely, short cones which pour out their smoke near to the ground—not to be allowed in any situation where reasonable objection can be taken. Every chimney used for the purposes of cement kilns to be at least 120 feet high. Circumstances may decide that chimneys must in some cases be higher—as when, for example, the ground rises near the factories and the smoke is apt to strike this ground readily. When the works are very large, and consequently the amount of smoke very great, a still higher chimney may be demanded for its removal. When the nuisance is found to be very great, it may be allowed to the appointed authority to insist on such a series of chambers for deposit of the solid matter of the smoke as will sufficiently diminish it. If the above methods still leave sufficient cause of complaint, it will be competent to the appointed authority to demand that the gases be washed to such an extent as may be considered requisite. Cement works not to be built until plans are approved of by the Local Government Board.

The materials used in making cement in the West of England are limestone or chalk, with clay or other aluminous deposits. They are ground together and burnt in kilns. In cases where the aluminous ingredient is mixed with organic matter, as in river mud, much unpleasant smell arises. Also, when either the limestone or the clay is bituminous, nuisance is created. The best palliative is found to be to pass the offensive smoke through chambers where it comes in contact with the wet material about in its turn to be burnt. To carry out this system the most useful form of apparatus is doubtless the Hofmann kiln.

In one of the large works in the North of England two systems of preparing the chalk and clay for cement making are in operation. One, the usual method, is by mixing the chalk and clay in a suitable mixer, in presence of an abundance of water. The watery mixture, or "slurry," is then run into large settling tanks, where the solid part subsides, whilst the water which collects at the top is run back again to the mixer and used over again with fresh quantities of chalk and clay. After remaining in the settlers for many weeks, and separating as much water as possible, the tenacious mud remaining is dried by means of the waste heat from the coke ovens used for preparing the fuel for the kilns. It then goes to the kiln and is burned. The other process differs more in detail than in principle. The mixing of the chalk and clay is performed in presence of water, but the water is reduced to a minimum. Enough water is added to confer on the "slurry"

fluid properties sufficient to enable its being pumped and transported in shutes and so forth. After being properly mixed, the "slurry" is run on to a horizontal drying floor, placed beside a kiln, the hot waste gases from which pass over the mixture, and afterwards pass up a chimney at the further end of the drying chamber. Each drying chamber is of a size sufficient to furnish a charge for the kiln in connection with it, and the waste heat from the kiln is enough to prepare the contents of the drying chamber for the burning process. Apart from financial considerations the latter method has something to recommend it. (1) The use of the waste heat from the kilns does away with the necessity of finding a cheap source of heat, and consequently there is not the same inducement to burn coke, an almost necessary adjunct to the older method. (2) The gases from the kiln passing through the drying chamber have time to deposit, and do deposit a portion of the solid particles they carry in suspension, and (3) by subsequently passing up a chimney the gases can be diffused and their disagreeable effects greatly modified. The opinions of manufacturers upon the two methods are both strong and conflicting. At Messrs. Johnston's works, in Gateshead, the latter process (which is patented by a member of the firm), is superseding the older one, though the old style is still in operation to some extent.

## THE NORFOLK AND NORWICH HOSPITAL.

THE new hospital which was opened on August 20 by the Duke and Duchess of Connaught is planned on the pavilion system. The style is an adaptation of the Queen Anne style to modern needs, the materials used being red brick and white stone dressings. The administrative block, which is in the centre, is an imposing pile of buildings, with a covered carriage-way at the entrance. The arms of the Prince of Wales (the Princess's being quartered with them) are borne on the stonework of this portion of the building. A cupola and tower, in which is a clock striking the hours, give a look of completeness to this block. The only connection the administrative section has with the pavilion on either side is by a corridor one storey high, with windows on both sides to secure a free circulation of air from front to back.

The administrative block consists of a basement and three storeys above. The basement contains a kitchen, a room 51 feet square, well lighted and ventilated, surrounded by the house-keeper's room, servant's hall, scullery, stores, &c.; a wide corridor runs east and west, and lifts are provided for sending the food to the patients, and for hoisting coals. On the ground-floor an entrance corridor 12 feet wide leads into a waiting hall about 40 feet square. On the right of the entrance are porter's room, the library, surgery, dresser's room, and dispensary. On the left are the secretary's room, the board-room, the matron's, and store-rooms. On the first floor are situated resident officers' sitting-rooms and bedrooms.

In the rear of the administrative block is the operating block, a one-storey building, consisting of an operating theatre, about 40 feet by 20 feet, well lighted, surrounded by six small wards for one and two patients; also with scullery, nurses' bedroom, bath, and lavatory; the whole approached from the main corridor, but sufficiently recessed from it to insure privacy and quiet.

The pavilions lie on the right and left of the administrative block, and communicate therewith by a lengthy, well-ventilated corridor, 10 feet wide. They are some 260 feet long and 29 feet wide, two storeys high (the centre being raised to form an attic storey), and with octagonal turrets at each of the four corners, in which are bath rooms, water closets, &c. Each wing is divided into large wards for twenty-four beds each, with nurses' rooms, ward sculleries; and there are also a number of smaller single wards. The ventilation is by large windows on each side and at the end of the wards; while communication with the turrets is only had by passing through a well-ventilated lobby. The upper storeys of the pavilions are approached by a spacious central staircase, abundantly lighted and ventilated. Each floor thus forms by itself, for all practical purposes, a separate hospital. For the special treatment of children's cases, two wards, one of thirteen beds and the other of four beds, have been provided in the north-east pavilion. In the rear of the new buildings, and on the city side of the area, a new chapel in the Gothic style is provided.

The out-patients' department is now most amply provided for. The block reserved from the old hospital has on the ground floor separate rooms for three physicians, and the two assistant surgeons. On the same floor, but at the further part of the block, is the museum, containing a large collection of rare pathological specimens and cabinets of the calculi removed from patients in the hospital, numbering over 1,100. At the extreme end of the block most distant from the out-patients' department are four wards for infectious cases. In the upper floor of the block are the nurses' dormitories, bath-rooms, &c. The wash-houses and laundry are fitted up with a powerful steam-engine, boilers, washing machinery of the most perfect character, and hot-air chambers for drying linen. A disinfecting chamber which may be heated to any required temperature is also provided. The heating of the whole building is done by open fires in the wards and principal rooms,

supplemented by hot-water coils and pipes, and all the corridors are heated by hot-water coils. A hot and cold water service is laid over the hospital, two sets of boilers being fixed in a central position, so arranged that each or either can be used together or separately for the whole hospital. The building is also fitted with speaking tubes and electric bells. Special arrangements are made for ventilating the pavilions and operating block. The wards and over-kitchen are built on the fireproof principle, with iron girders and concrete; hydrants are, however, fixed in suitable positions inside and outside the establishment. All the cooking is arranged to be done by gas, as it is believed that that system is more economical, cleanly, and effectual than cooking by coal fires.

The architects whose plans were adopted were Messrs. Boardman and Wyatt. Mr. Wyatt, however, died soon after the work had been begun, and the carrying out of the whole has, therefore, been under the direction of Mr. Boardman. The contractors were Messrs. J. W. Lacey & Co.

### THE LATE MR. WILLIAM GODWIN.

MR. WILLIAM GODWIN, of Lugwardine, the proprietor of the well-known encaustic tile works, died on Tuesday evening in last week. The *Hereford Times* says that Mr. Godwin was born on January 3, 1813, in Bearwell, Leicestershire, soon afterwards removing into Gloucestershire with his parents. His early life was passed in the brickfields on the banks of the Severn, and his career then and subsequently is an example of success attending honest, straightforward perseverance. Such was his conscientious zeal and enterprise in every progressive grade, that immediately on the close of his apprenticeship his services were secured as manager of an adjacent brickworks. Here he remained for a short period, when some of the chief of the engineering party for the Severn Navigation Company who were on the river noticed the superior manner in which the goods were made under his management. A little conversation ensued, and resulted in his being offered the charge of a new undertaking of the same kind at Ledbury, which position he accepted and held for several years. Family cares, however, increasing, led him to seek something on his own account, and he went to Lugwardine, still pursuing the same work. Here he eventually so expanded and developed the resources at his command that he was able to say at the finish of the laying of the tile pavement in Gloucester Cathedral, "I made and carried—i.e., assisted to load, navigate, and unload many of the bricks that were used to build some of the early warehouses in Gloucester Docks, and now I have completed the tiling in the choir of this noble cathedral." And he also said, "In the meantime I have seen a little of Gloucester's rise and progress." The encaustic tile work was carried on at Lugwardine in combination with the brickmaking until about twenty years ago, when all the finer processes of the encaustic tile manufacture were removed to his new extensive works at Withington. "Godwin's Encaustic Tiles" have now for many years been famous throughout the civilised world, and Mr. William Godwin has been distinguished, and deservedly so, as the producer of ecclesiastical art treasures of the highest excellence and beauty. Llewellyn Jewitt, F.S.A., in "Ceramic Art in Great Britain," says, referring to Mr. Godwin's tiles: "His tiles are exact reproductions, not designs modernised, and this it is that gives to floors laid by him that peculiar charm which they undoubtedly possess. In addition to actual copies of old tiles, Mr. Godwin has produced a large variety of new designs, in which the patterns are characterised by pure mediæval feeling, and by excellent workmanship. The tiles are of extremely hard and durable quality, and the colours clear, distinct, and good." Such complimentary notices of his productions were numerous. Not only in Gloucester Cathedral, but in the cathedrals of Worcester, Salisbury, Hereford, Rochester, Edinburgh, St. Asaph's, St. David's (Exeter), Manchester, Carlisle, Chichester, Christchurch, and Armdale (New South Wales), and a vast number of other churches and important public buildings, were Mr. Godwin's tiles largely used to beautify the pavements, &c. As a thoughtful, far-seeing man, with good practical judgment in business concerns, Mr. Godwin was often called upon to arbitrate in disputed matters. Mr. Godwin was for some time the guardian for the parish of Lugwardine, this being, we believe, the only public office he ever held.

The life of Mr. Godwin affords a very pleasing example of steady, persevering labour and enterprise crowned with success. It is divulging no secret to say that the encaustic tile works at Withington have been a very prosperous concern, and that Mr. Godwin had amassed a considerable fortune as the result of the world-wide trade secured by the excellence of his products. What made him so much esteemed, however, was that in the midst of his growing prosperity the kindly, generous qualities which had distinguished him in his younger days remained unimpaired. He preserved to the last a warm and benevolent disposition, unmarred by anything in the nature of ostentation; and he leaves behind him the memory of a truly Christian character, which won for him the esteem of all who knew him. A short time prior to his death

he took into partnership his eldest son, Mr. William Godwin, who has, indeed, exercised entire control of the business for some years past, during his father's declining days, and who, it is well known, inherits all his father's estimable qualities. Mr. Wm. Godwin is therefore now, we presume, at the head of the flourishing establishment.

### REVIEWS.

MODERN PERSPECTIVE. A Treatise upon the Principles and Practice of Plane and Cylindrical Perspective. By Professor W. R. WARE. (Boston, U.S.: J. R. Osgood & Co. London: Trübner & Co.)

It has been remarked by De Quincey, as a curious mental phenomenon, that a man who had never been taught drawing, if asked for a sketch of a solid object, would be certain to ignore the fact that some of his lines must converge, although he might be able to give a suggestive notion of one of the faces of the object. What is more remarkable is the occurrence of some skill in drawing without the power of accurately representing the relation of the parts of an object, or of different objects, to one another in respect to distance. The Chinese, for example, seem to have a peculiar mental twist (unless they act in obedience to conventional canons which cannot be disregarded), through which the relative proportions of objects are different to what they appear to be in the eyes of an European artist. When we see the interest that was attached to perspective representations by the Pompeian decorators, who considered it to be a feat to show a picture hanging inclined from a wall or a door ajar, it is evident they knew that very great power in painting natural forms is not sufficient to enable an artist to suggest the effect of distance. The stories that are recorded of the fear of some of the early Italian painters that their perspective dodges might become generally known, is also evidence that even a genius finds a difficulty in dealing with a vanishing point. Does not every exhibition of paintings also demonstrate that for many artists perspective still remains a mystery?

It is not difficult to explain how it happens that so few artists have mastered perspective. Whether it is taught by a mathematician or empirically a scientific form has to be given to its propositions, and at all times art and science have been supposed to be in opposition. But in this case science cannot be evaded. There is no royal road to perspective, and if students wish to gain possession of it they must patiently travel step by step along the route.

The book on perspective by the Professor of Architecture in Columbia College is evidently the work of a man who is aware of the difficulties that are somehow inseparable from the teaching of perspective, whether in classes or to pupils singly. Students who will go through courses of pure mathematics without raising a question as to the procedure expect to gain a knowledge of perspective without any strain on their comprehension. Professor Ware goes some way towards assisting students of that class by his ample explanations; but he also adopts a more scientific form, and his series of problems, definitions, and axioms are almost Euclidean in their systematic arrangement. There is no better way to impress the truths of the science on the mind. The illustrations, which are in a separate atlas, are also adapted to the requirements of various classes of students, and range from simple diagrams to elaborate views of buildings. The work is, in fact, far more complete than any of the treatises on the subject which have been published in this country, and our English professors will find it no easy task to produce one that will be equally useful to painters and architects.

ACCENTED FIVE-FIGURE LOGARITHMS, OF NUMBERS FROM 1 TO 99,999, WITHOUT DIFFERENCES. By LEWIS D'A. JACKSON. (W. H. Allen & Co.)

This is another of the ingenious books of tables which have been compiled by Mr. Jackson for the purpose of facilitating calculations. The system adopted is that of marking in five-figure logarithms the final figures with dashes or dots, according as they are strong or weak, or, in other words, according as the final figure is to be treated as if it were larger or smaller. Thus, for example, to take a very simple case, the log. of 175 would be, if a six-figure table were used, 2.243038; but an approximate result may be obtained in a shorter time by a five-figure table, the log. becoming 2.24304. The last digit is hardly correct, and in a series of calculations the adoption of it might lead to inconvenience. A sort of give-and-take rule is employed, which is not, however, always satisfactory. Mr. Jackson's book indicates the character of the final digit, and in the case we have selected a dash shows that the mean value of the 304 is somewhat less, and allowance must accordingly be made in employing the logarithm. The advantage of the method is that five figures can be made, without any additional trouble, to answer as well as six or seven figures. The tables, which include sines, tangents, &c., have been clearly printed, and, from their convenience, they are likely to supersede the ordinary tables, unless in cases where time is of no importance. In the Neperian logarithms there are eight figures besides the

characteristic; in the common system the number was a little diminished, and it was reserved for Vlacq and De Lalonde to make five figures answer. As the latter said, "Les architectes ont un besoin continuel des petites tables, bien plus rarement des grandes." Mr. Jackson has contrived to go a step further, by giving unvarying certainty to the five-figure system.

## ENGINEERING WORKS.

**The Mersey Dock Estate.**—The annual report of Mr. G. F. Lyster, engineer to the Mersey Docks and Harbour Board, shows that during the year ending July 1 a total of 513,493*l.* 19*s.* has been expended in his department upon dock works and maintenance on the Liverpool and Birkenhead sides of the river. The total expenditure upon dock extension at the north end of the city, under the Act of Parliament obtained for that purpose, now reaches 2,396,751*l.*, while at the south end there has been expended in similar works 598,099*l.* This, however, represents but a small portion of the work yet to be done, as a scheme for the deepening of existing docks and the construction of others has only recently commenced. At the meeting of the Dock Board a recommendation of a novel kind was presented, being to approve of a plan for pumping water into certain graving docks to a height considerably above the river level. By this means, it was stated, an adequate depth of water would be secured to float the largest steamers entering the port. The cost is estimated to be 26,000*l.*, and the project for pumping water into the docks is recommended in preference to the alternative method of deepening the docks themselves, inasmuch as the latter would involve a cost of 50,000*l.*, and would moreover prevent the use of the docks during the progress of the works. In the course of the discussion upon the matter, it was mentioned that Messrs. Glynn & Co., of London, whose tender for erecting the pumping machinery it was proposed to accept, were the constructors of the pumping works at Ferrara, Northern Italy, for the purpose of draining the marshes, and that the power of the pumps was so great as to raise a body of water capable of filling a basin of a square mile in extent to the depth of 3 feet in twenty-four hours. In the case of the Liverpool graving docks, it was estimated that the proposed machinery would raise the water 3 feet in an hour and a half. The matter was postponed for a fortnight.

**The Mersey Tunnel.**—Since the report presented to the annual meeting of shareholders the progress made towards the completion of the tunnel has been very satisfactory. Colonel Beaumont's boring machine has passed the very hard stratum of rock which for some weeks retarded its progress, and is at work upon a variety of the sandstone more easily dealt with. In the last fortnight 67 yards have been excavated, leaving 683 yards still to be passed through before the extremities of the two headings are united. At the present rate this would be accomplished in 20 or 21 weeks. In all other respects the undertaking is progressing equally well. Having driven an adit on the level of the floor of the tunnel in advance of the excavation of the whole section, and then making a chamber at the end of the adit, the contractor is enabled to work on from that point, just getting four faces to work upon—two on the Liverpool and two on the Birkenhead side. All these four faces are under the full tidal flow of the Mersey, far beyond the landing-stage on either side, but the drainage headings, one of which is being driven by the boring machine, are in advance of the main tunnel.

## CHURCH BUILDING AND RESTORATION.

**Halifax.**—The annual accounts of the churchwardens of Halifax parish church include those for restoration since 1877. The total cost, all of which is defrayed, was 19,605*l.* 14*s.* 5*d.*; the chief account being that of the builder, Mr. John Thompson, of Peterborough, for 13,200*l.* The organ alterations cost 1,783*l.*, and the amount paid to the executors of the late Sir G. G. Scott, the architect, was 830*l.*

**Great Grimsby.**—The new Roman Catholic church of St. Mary-by-the-Sea, at Holme Hill, was lately opened. It has been erected at the cost of Mr. T. A. Young, K.S.G. The plan comprises a nave and aisles, a chancel of ample proportions, and convenient sacristies, with good access to the presbytery, erected some years ago on the south side. At the end of the north aisle is a small apsidal chantry chapel and altar, dedicated to the Sacred Heart, in front of which a vault has been prepared for the founder. The organ is placed in a tribune on the south side of the chancel over the choir sacristy, with a projecting balcony and lattice to screen the singers—a familiar feature in Italian churches. The following are the dimensions of the church as at present completed: Chancel 40 feet long by 27 feet wide, and 50 feet high to the top of the panelled ceiling of the roof, and lighted by side windows the sills of which are 20 feet above the floor, the altar platform being raised nine steps, while the large east window of five lights is raised 25 feet above the nave level, with grand effect. This arrangement was devised to fit the altar and reredos, which are in accord with

the surroundings, and call for special notice. The altar, a fine slab of Hopton Wood marble, is 10 feet long, supported on a subbase of delicately veined alabaster and Derbyshire fossil marble pillars. The tabernacle is of alabaster, with engraved, enamelled, and gilded metal doors, which have been executed by Messrs. Richardson, Ellson & Co., from the designs of Mr. J. F. Bentley. There is a marble pedestal behind for the crucifix, and to the rear a throne of alabaster and Irish marble for the monstrance during the rite of benediction. Above is a lofty canopy, 21 feet high, with an open spirelet and statuettes of angels carved in Gloucester stone, and richly gilded. It is approached by staircases immediately behind, and detached from the eastern wall as required by the rubric, the wall itself being panelled with a carefully-designed arcade of stonework, carrying in the centre a retable or reredos of woodwork, rising to the height of 25 feet, and above it the great east window forms an important finish to the whole composition, and is to be treated as a "Jesse" window. The reredos will be gilded and filled with a series of paintings by Mr. Westlake. The stone and marble-work have been executed by Mr. Boulton, of Cheltenham; the wood reredos by Messrs. J. Tomlinson & Sons, of Leeds, from the designs of Mr. Chas. Hadfield, the paintings being by Mr. Westlake. The nave of four bays is at present 64 feet long and 34 feet wide, including the pillars, and 50 feet high, the aisles being the same length and 8 feet wide. The design, as laid out by the architects, embraces a further extension of three bays, including a massive tower and slate spire 200 feet high, with entrance porch, and baptistry, and south porch, forming an effective west front, facing Heneage Street and the Board schools. It has been the aim of the architects to express the idea of size and solidity, as in the great North-German Mediæval churches, and the material of which the fabric is constructed is a local brick of warm red tone, with a sparing use of Yorkshire stone. The nave and aisles are under one roof, and the junction with the chancel is marked externally by a lofty *flèche* or spirelet, covered with lead and Westmoreland slates, rising 50 feet above the ridge, in which hangs a bell of about one ton weight. The architects of the building are Messrs. Hadfield & Son, of Sheffield; the contractors for the church being Messrs. Riggall & Hewins; and for the sacristy, &c., Mr. J. G. Smith, both of Great Grimsby.

**Wesleyan Chapel Building.**—The minutes of the Primitive Methodist Conference show that there are 4,200 Connexional chapels, valued at 2,807,719*l.*, with an annual income of 254,252*l.* They provide accommodation for 893,679 persons. In 1882 there were 91 new chapels built, at a cost of over 84,000*l.*, and providing sittings for 22,000 hearers. Besides the chapels there are 1,542 other places where regular religious services are held.

**Lochgillhead.**—The Free Church, which was built to replace the old wooden structure, has been opened. It was erected from the designs of Messrs. Campbell Douglas & Sellars, architects, Glasgow, the contractors being Messrs. D. & J. McKellar, of Lochgillhead. The church is small in size, being 53 feet long by 30 feet wide inside. The front gable has a Gothic window of three lights, and at the other end there is a rose window filled with stained glass, painted by Messrs. Adam & Small, of Glasgow. The side walls are 14 feet high from the floor, and the roof is partly open, giving a clear height of 26 feet to the ceiling. On the south side is a porch surmounted by a small slated spire. At the back of the church is a large room to serve as vestry and session-house. The accommodation provided is now for about 260.

## NEW BUILDINGS.

**Convalescent Home, Felixstowe.**—A new wing for male patients is to be added to the existing home. The buildings will consist of a basement, in which will be a smoking-room for men, spacious kitchens, storerooms, and other servants' offices. On the ground-floor the matron's sitting-room will occupy a central position between the old building and the new, with connecting corridor at the back. The men's sitting-room and dining-room will run right through from front to back. A sitting-room, connected by a lift with the kitchen, will supply the dining-rooms, and it is so placed as to be equally accessible from either wing. On the first and second floors will be four dormitories (two on a floor), with lavatories, bath-rooms, and other conveniences to each. The matron's bedroom will be on the first floor, with servants' bedrooms above it. All the rooms will be of good height, well lighted and ventilated. The walls will be carefully constructed so as to exclude the damp. There will be verandahs to ground and first floors, running the whole length of the new south front, and 6 feet in width. The building will be faced with red brick up to the first floor, and studwork above this, weather-tiled on the outside. The east front will be broken up by two large chimney-stacks, corbelled out to stop the tiling of gables above, whilst two overhanging dormers, constructed of half timber-work and brick-nogged, will give an effective sky-line to the south elevation. The roofs will be plain tiled. The drainage will have careful consideration, and will be remodelled. The lavatory, bath-fittings, &c., will be of the most approved sanitary description. The old building will be

altered and improved in some important particulars, which will render it much more spacious and convenient. The sea-baths will be placed in the old basement, where there will also be a children's playroom, dispensary, &c. The estimated cost of the new works is 2,350/. Mr. E. F. Bishopp, of Ipswich, is the architect.

**New Offices, Birmingham.**—A large block of buildings for offices will shortly be completed in Corporation Street. It will be the Lincoln's Inn of Birmingham. The site has a frontage of 145 feet, and is 125 feet deep. The building is four storeys high, and is in the French Renaissance style. The offices have been arranged in suites around a court, each having a separate entrance and strong-room. On the ground floor are ten shops. There is also a large room, measuring 48 feet by 42 feet, which may be used for auctions, and in connection with it is a store-room, 37 feet by 17 feet. The cost of the building, which is being built for Mr. Alfred Humpage by Messrs. Horsley Bros., under the direction of Mr. W. H. Ward, architect, will be about 21,000/.

**Free Library, Dunfermline.**—This building, which owes its origin to the liberality of Mr. Andrew Carnegie, of New York, was opened on Wednesday last. It adjoins the St. Margaret Halls, and has frontages both to St. Margaret and Abbot Streets. On the Abbot Street side are situated, on the ground-floor, reading-rooms for ladies and gentlemen; while on the floor above, the library is located. This front measures 82 feet in length, and is two storeys high, with ranges of square-headed windows having single mullions, and in the upper range attached columns with carved capitals. A moulded string-course runs along the centre of the greater part of this front, and the wall is surmounted with a plain-moulded cornice. The principal entrance is near to the centre of the elevation, which at this point is treated so as to secure the appearance of a square tower, carried a storey higher than the rest of the building. Above the doorway is a scroll with carved foliage, on which the name of the institution—"The Carnegie Free Library"—is cut, beneath a representation of the rising sun. The St. Margaret Street front is somewhat similar in design, and extends to 70 feet in length. On the ground-floor here is a dwelling-house for the keeper, and, above, a large recreation-room. The front is divided by string-courses, which form hoods to the windows, while in the centre is an octagonal tower rising to the height of 68 feet, covered with a slated spire, which terminates in an elaborate iron finial, carrying the cardinal points. The library-room measures 57 feet by 25, the recreation room 26 feet by 25, the gentlemen's reading-room 34 by 25, and the ladies' reading-room 22 by 18. The library-room has an open timber roof of ornate character, the centre of the ceiling being 23 feet 6 inches from the floor. A spacious stone staircase gives access from the hall to the library and other rooms. The architect of the building is Mr. J. C. Walker, of Edinburgh.

**Coffee Palace, Birmingham.**—The new shops and offices in Corporation Street, which have been erected for the Birmingham Coffee House Company, were opened on Wednesday last by Mr. John Bright, M.P. The buildings were designed by Mr. William Doubleday, architect, of Birmingham, and are of a French Gothic type. Towards Corporation Street the frontage is 60 feet, and the height to the eaves is about 60 feet, the turret rising to 120 feet. The material of the front is Corsham Down stone, with Portland stone for weight-bearing lintels and corbels, and was executed by Messrs. J. Miller, Carr & Co. The columns and piers of the ground-floor are of polished red and gray granite, by Messrs. Jas. Wright & Sons, of Aberdeen. Mr. John Smith was the carver. The internal work was designed by Mr. J. P. Osborne. The general contractor was Mr. James Moffat.

**Offices for the Lancashire and Yorkshire Railway.**—The Lancashire and Yorkshire Railway Company are about to erect a large block of buildings at the Victoria Station, Manchester. At the same time important improvements in their existing offices will be effected, so that the old and new buildings will form a complete block of offices that will fully meet the requirements of the whole of the departments. In the present building this cannot be done, and the inconvenient necessity of renting offices away from the official centre has for some time existed. The new buildings will be in the Classic style, and will harmonise with the existing building. Designs have been prepared by Mr. William Dawes, of Manchester, who has been appointed by the directors architect to carry out the work.

**Victoria Restaurant, Manchester.**—One of the principal features in connection with the hotel portion of the Victoria Buildings, Manchester (a magnificent block which has already cost over 120,000/), is the grand billiard saloon in the basement. This splendid "cellar" has been cut out of the solid rock, and is one of the finest underground rooms in existence. The design is of massive proportions, and is rich in ornament and coloured decoration. It was originally intended for a billiard saloon only, as is seen from an illustration in *The Architect* some years ago, but the new proprietor has decided to devote it to restaurant purposes. To meet this new requirement considerable alterations have had to be made, involving an outlay of between 1,000/ and 2,000/. The works are being carried out by Mr. William Dawes, the architect of the whole building, from whose design the new hotel forming part of the block is being erected, at a cost of over 50,000/.

## SCHOOL BUILDINGS.

**St. Paul's Schools, Blackburn.**—These schools were re-opened on Saturday last after undergoing extensive additions. The extension provides on the ground floor a girl's school-room and class-room. On the upper floor the old school has been extended. There are two class-rooms divided by revolving-shutters, and also a young men's room with raised platform, the roof of which is open-timbered. The additional accommodation is for 411 scholars, exclusive of the young men's room, and the cost has been about 1,500/. The work has been carried out from the designs and under the superintendence of Mr. William S. Varley, F.R.I.B.A., architect, Blackburn.

## GENERAL.

**The Centenary** of the birth of the German painter Peter Cornelius is to be commemorated by a festival organised by the Berlin artists.

**Signor Fontana** has completed full-size figures in marble of the Queen and the Prince of Wales, and a typical figure of New South Wales. They are intended to be placed in the Government offices at Sydney.

**The Trial Cartoons**, showing the proposed decoration of two bays in the dome of St. Paul's, will shortly be placed in their positions. They are by Mr. Poynter, R.A., and Mr. Stannus.

**Sir Rupert Kettle** will preside in the Art Department at the forthcoming congress of the Social Science Association at Huddersfield.

**Mr. C. N. Tripp**, architect, died at Gloucester on Saturday, in his thirty-eighth year.

**Mr. Ernest Day, of Worcester**, has been appointed architect for the church which is to be erected at Rainbow Hill, Worcester.

**M. Charles Garnier**, the architect of the Paris Opera House, has been elected a member of the Société des Gens de Lettres.

**A Post Office** is to be erected on the Quayside, Newcastle-on-Tyne, from designs by Mr. Parsons. The contract has been taken by Mr. Walter Scott. The telegraphing department will be on a large scale.

**A Chapel for the Maidstone Union** is to be erected from the designs of Mr. H. A. Cheere, of Bagshot.

**The late Dean Boyd** has bequeathed 1,000/ towards the restoration of Exeter Cathedral and the restoration or enlargement of the library.

**The Foundation-stone of the Glasgow Municipal Buildings** is to be laid by the Lord Provost early in October.

**Mr. William Eve** has revalued the town of Reading. The ratable value has been increased by 40,662/, the old valuation list having stood at 176,756/, as against 217,418/ on the new list. The chief increase is upon the larger properties in the town, such as the gasworks, factories, railways, large shops, &c., some of these having been doubled in value.

**The Hohe Linie Inn** at Erfurt has been adorned by tablets which record that the following persons have resided in the house: 1341, Duke Christian of Brunswick, Archbishop of Bremen; 1541, Landgrave Philipp of Hesse; 1543, Duke Maurice of Saxe; 1543, Dr. Martin Luther; 1631, Gustavus Adolphus, King of Sweden; 1817, Frederick William, King of Prussia.

**A Station** is in course of erection on the South-Eastern line at Lower Nutfield, near Redhill, where Mr. H. Edwards, M.P., is laying out an extensive building estate.

**The Firm of Mintons**, of Stoke-on-Trent, is about to be formed into a limited liability company. The members of the firm—Messrs. C. M. Campbell, T. W. Minton, and Herbert Minton—will continue their connection with the concern, and will be joined under the new arrangement by several gentlemen who have been for long periods in the service of the firm.

**Mr. J. Campbell Walker**, of Edinburgh, has obtained the first prize in the competition for the Hawick town hall. There were twenty competitors.

**The Carving in Alto-relievo**, which is supposed to have been the work of Albert Durer, is now exhibiting in one of the northern galleries of the British Museum. The subject is *The Birth of St. John the Baptist*. The material used is Pappenheim hone stone. This carving was bequeathed to the nation by the late R. Payne Knight.

**The Ventilators** for the Dudley Free Library are being supplied by Messrs. C. Kite & Co., of Chalton Street, London, N.W.

**The Technical Schools** in connection with the Nottingham University College will, it is expected, be ready for opening in October. The college authorities intend to give a complete course of instruction in mechanical and electrical engineering, and in the sciences most closely connected therewith; while artisans will be instructed in mechanics and in the history and details of the machinery employed in the staple industries of the town.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, SEPTEMBER 1, 1883.

### TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*\*\* Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—“Contract Supplement to THE ARCHITECT.”*

### EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

### TO AMERICAN SUBSCRIBERS.

*All subscriptions are payable one year in advance, and may commence at any date.*

*The cost of one year's subscription, mailed free, is 20s. sterling per annum, and Post Office Orders for that amount can be obtained at any Post Office in the United States.*

*Post Office Orders should be made payable at Lombard Street Post Office, London, but SHOULD BE ADDRESSED to GILBERT WOOD, 175 Strand, W.C., London, England.*

*In order to meet the difficulty which constantly arises from subscribers in the United States omitting to advise the Publishing Office at the time they remit a Post Office Order for the amount of their Subscriptions, and also as a reply to frequent inquiries as to the best means of obtaining THE ARCHITECT in America, the Publisher desires to offer the following suggestions:—*

*To prevent the possibility of delay, and to enable the Post Office Order to be the more readily traced in the event of its miscarriage in transit, it is advisable in all cases to notify per following mail, the number, date, and location of the order.*

### COMPETITIONS OPEN.

BRISBANE.—Nov. 30.—Plans are invited for the Erection of a Town Hall. Messrs. Gordon & Gotch, 15 St. Bride Street, E.C.

SEWER GAS.

AS AN ABSOLUTE PREVENTIVE  
of the entry of Sewer Gas into Dwelling  
Houses by way of the most dangerous inlets,  
viz., the waste and overflow pipes from cisterns,  
baths, lavatories, and sinks, DOULTON & CO.  
strongly recommend the use of

MANSERGH'S  
IMPROVED GULLY.

By the insertion of this Gully in the line  
of drain OUTSIDE the house, the common and  
UTTERLY USELESS bell-traps may be dispensed with,  
and direct communication with the sewers is  
effectually broken.

"This is undoubtedly a most important and  
effective trap for preventing the entrance of sewer  
gases into dwelling-houses."—LANCET.

PRICE 10s. 6d. EACH, COMPLETE.

MANUFACTURED BY

DOULTON & Co.

tural and Civil Engineering purposes, also litigated cases  
of light and air or other easements.—F. H. McLAUCHLAN,  
19 Dalryell Road, Stockwell, S.W.

WANTED, on the outskirts of London, a  
FACTORY capable of taking 70 to 100 men. Good light  
and ventilation essential. Steam power, if possible.—WOOD-  
HOUSE & RAWSON, 11 Queen Victoria Street, E.C.

READING CASES FOR THE ARCHITECT.  
Price Two Shillings.  
Office: 175 Strand, London, W.C.

# LINDSAY'S

## IMPROVED PATENT REVERSIBLE TREADS & LANDINGS

### FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

In Hospitals, or places where it is desirable to be free from dust, the blocks can be placed close together, not leaving any cracks, so that the treads or landings can be swept or washed quite clean; also, if it be necessary to get light under a Staircase or Landing, rough glass blocks can be fitted in the Iron frames, side by side with the wood, and a subdued light thus obtained.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be re-filled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works,

13, 14, & 15 SOUTH WHARF, PADDINGTON, LONDON, W.

# The Architect.

## BOLDNESS OF CONSTRUCTION.

AMONGST the reasons—many of which are not easily discoverable—why the English profession of architects is held in less honour nowadays than on general grounds it ought to be, perhaps one of the weightiest is the manifestation of a certain want of pluck, which by the modern world is always regarded as a sure sign of conscious incompetence. Compared

with our engineers, for instance—and this comparison can seldom, if ever, be avoided—our architects appear to be so completely behind the age in everything that concerns construction that even the most intelligent outsiders seem to think they need go no further for a test. What is engineering but building? And what is architecture but building? Why, then, should the engineer be so courageous and the architect so timid? Every day we hear of something accomplished, or proposed to be accomplished, by engineers, which proves their vocation to be one that is full of bold enterprise and fertile resource. The engineer is a man of science in the highest and noblest sense of the term. His railways, his bridges, his tunnels, his sea-walls, his lighthouses, and a thousand works besides, are Herculean—not gigantic only, but fearless. As the old Egyptian artists in their quaint battle-pieces represented the conqueror of nations, in his character of more than man, in the likeness of an irresistible colossus, so might we in these days, if we had no better mode of expression, not inaptly represent the conquerors of nature. But who would venture to submit to public criticism in any such magnified form the modest proportions of one of our eminent architects? We perceive intuitively that it is not to be done. More especially in an age of strict common sense like the present, when all pretensions are weighed in the same relentless balance of utility, and the very pleasures of imagination and the dreams of hope are reduced almost to algebraical equations, one must see it to be impossible to draw a line across such a very practical field as that of building, and, while on this side encouraging and demanding scientific courage as a *sine quâ non*, on the other to recognise the necessity for nothing else but calm and timorous repose.

We are bold enough to assert that in the very nature of building there is something that repudiates this distinction. If the engineer-constructor, that is to say, must in these days be essentially a bold constructor, then is it impossible for the age to accept the architect-constructor as essentially a timid constructor. That he professes to be an artist first and a builder afterwards is an answer that many will be disposed to offer as a way of escape from the difficulty, but we are quite sure it would be useless to ask English opinion to accept this even as a plausible excuse. There is nothing in art, and least of all in architectural art, which is incompatible with science, or in any way calculated to divert it from its direct aim. On the contrary, it is the boast of architecture that its art is but the handmaid of its science, the dresser, adorer, beautifier, nothing less but nothing more. The abstract architect, therefore, of a generation like ours, is simply the scientific designer *plus* the graceful modeller of building. The engineer, if he has a head on his shoulders, needs nothing more; the architect has a heart in his breast, but he ought to have the same head on his shoulders.

As a mere incident of engineer-construction, for which nobody will think it worth while to claim any particular credit, but which perhaps may nevertheless be of interest to architects as an illustration of our present argument, we will take leave to mention something that has just been done in the City. An underground railway is being formed on the line of Cannon Street and Eastcheap. It is a tunnel of ordinary form some 25 feet wide by 16 feet high, vaulted over in brickwork in the usual way. Now it will be remembered that the statue of King WILLIAM IV., a granite figure of heroic size on a ponderous granite pedestal, occupies a position between the end of Cannon Street and the beginning of Eastcheap—being more artistically placed than usual—which may

be described as very nearly, if not exactly, on the central axis of the two thoroughfares taken as one. The line of tunnel, therefore, would in its simplest form run almost or quite directly under the statue. But the actual weight of the statue with its pedestal and foundation must be a great many tons, and this with the disadvantage of a narrow basis. What, therefore, was to be done? In reply to this question, which probably no English architect would think of answering except in one way, the course decided upon was directly the reverse, namely, to carry the tunnel immediately under the statue; and so the work has been done. No extraordinary precautions were taken; no appearance of settlement has resulted; and the simple fact is that where a few weeks ago the heavy granite pile stood upon the solid ground, it now stands over the centre of a vaulted tunnel and nobody knows the difference.

We do not wish to be understood to claim any particular admiration for this little feat of bold construction; and if we venture to say we do not know any architect who would have taken the risk of it, we have no desire to disparage the profession; we certainly are disposed to think that, if an architect had been the constructor of the tunnel, he might very fairly have pleaded prudence as a reason for diverting the curve, and this is enough for our purpose.

If the truth may be for once a little plainly told, the constructive enterprise of architects seems to be chiefly exercised in economising the substantiality of their walls and timber-work, and, perhaps most of all, their foundations. Daring deeds in this way are no doubt done only too often. It is a common thing to hear a certain class of architects boast of the cheapness of their mode of building. In competitions, when the promoters dictate a maximum of accommodation and a minimum of cost, and when certain competitors claim credit for having adhered honestly by such instructions, while others have not, what is really meant? It is idle to pretend to believe that the difference between one estimate and another is a question of skill in construction, or of skill in artistic design; it is much more a question of what is called economy, the phrase signifying cheap building in the most direct sense, and in an indirect way the most unsubstantial building that a decent designer dares to propose. The time has been in history, and more than once or twice, when the first consideration in building a house or a church was to make it a permanent structure, one that, in common parlance, would last for ever; but in our day the first consideration seems to be, in nine cases out of ten, how to save the last shilling that can be saved if the structure is to stand at all. Exceptions to this melancholy rule there doubtless are, but it is not too much to say that they are such as to entitle the architects concerned to special honour, and to entitle their employers indeed in like manner to the glory that belongs to the virtue of resisting strong temptation.

It is not our purpose, however, to dwell upon the form of professional frailty here indicated; our dissatisfaction points to much higher ground. What we desire to submit for the consideration of the profession of English architects in these days of engineering courage is the proposition that in architectural work also there is room, although not perhaps to the same extent as in engineering, for a similar boldness of construction which shall be characteristic of the age. When we say that the typical engineer is a man of science, we confess to the insinuation that the typical architect is not, and we affirm that he ought to be. Perhaps it is in Gothic work alone that anything really formidable has ever been attempted for the last fifty years, and further back than that it is useless to go. But what is the boldest of our modern Gothic work to the corresponding work of the Mediæval builders? It is no answer to say that modern imitators have never had the same opportunities that were afforded in the Middle Ages by the stupendous enterprises of the Churchmen of those times. No doubt the great magnitude of the Mediæval cathedrals and abbey churches, the unlimited wealth at the command of the clergy, and the prodigious enthusiasm of the artistic religious sentiment, all contributed to the provocation of construction of the most adventurous description; but it must be remembered that the purely scientific or mathematical resources then available were far indeed behind modern standards, and our wonder, consequently, only increases when we contemplate the timidity with which the modern Gothic follows the ancient, glad for the most part to produce a fairly recognisable histrionic presentment of the outer face, while the inner articulation is helplessly ignored. But if, as seems probable, it is in quasi-

Classic style that the great works of the next half century are to be designed, then it is not even in superficial imitation of antiquity that science will find its sphere of action. In a word, what the architect has now to do, if he would emulate the science of the engineer, is to study what the engineer studies, and work as the engineer works upon that basis. Why, for instance, should not our architects again claim for their own the design of bridges? Now that competition has apparently taken a fresh lease of popularity, we should be very glad indeed to see a bridge made the subject of an open contest of this kind, for the mere purpose of allowing architects an opportunity for accepting science and still attempting art. But it is not in such a work as a bridge alone that we see an opening for the architectural science we advocate; in the design of churches, municipal edifices, great domes and towers, railway stations, even warehouses and factories, those who will seek for opportunities to exhibit scientific construction will so frequently find them that nothing beyond the ordinary limits of the architect's practice need ever be demanded by those who are willing, and of course able, to combine advancing science with advancing art.

### THE BRUSSELS ARCHITECTURAL EXHIBITION.

ON the 2nd inst. the Belgian Minister of the Interior declared open an important and interesting exhibition of architectural works, organised by the Société Centrale d'Architecture de la Belgique on the occasion of the tenth anniversary of its foundation. Material assistance was given not only by the municipality of Brussels, but also by the Government. The Minister of the Interior, recognising the services which the society is rendering to the cause of art, placed at their disposal the whole of the upper storey of the Palais des Beaux-Arts, the ground-floor of which is at present occupied by an international photographic exhibition, held by the Association Belge de Photographie.

The Palais des Beaux-Arts, in the Rue de la Régence, inaugurated in 1880, was designed by M. BALAT, Architecte du Roi, and will probably cost, when all the decorations are completed, a sum of 4,000,000 frs., or 160,000*l.* M. BALAT selected the Italian Renaissance style as best lending itself to the conditions of lighting and the various purposes for which the building is intended; that is to say, the triennial fine art exhibition like that of the Royal Academy, public solemnities such as the distribution of prizes, musical festivals, and occasional art exhibitions like the present. He has, therefore, arranged a large central hall flanked by saloons, over which latter is a spacious gallery. The roof is carried by handsome columns of Belgian *rouge royale* marble, which produce a highly imposing effect, recalling some of the compositions of PAUL VERONESE. The façade has four Corinthian columns of red Scotch granite, with bronze capitals and bases. On the summit of the *acrotere*, the cypher of the king, as protector of the beaux-arts, is to be supported by two figures representing *Peace* and her daughter *Prosperity*. One of the four bronze statues surmounting the columns, that of *Music*, is already placed; but the other three, of *Painting*, *Sculpture*, and *Architecture*, are not yet finished. Two bas-reliefs in white marble, representing musical and decorative art, are already in position; and over the doors are busts of RUBENS, JEAN BOLOGNE (the Belgian sculptor), and VAN RUYSBROECK (architect of the Brussels Hôtel de Ville). Two groups of three figures each, representing *Instruction in Art* and *The Reward of Art*, are yet to be placed on two pedestals, one on either side of the peristyle.

The Société Centrale d'Architecture de la Belgique was founded in 1872 by about sixty young architects and architectural draughtsmen. The objects were to improve the status of the members by mutual instruction, by lectures, and by archæological and artistic excursions, and also to establish an office for employment, sought and offered, and a sick fund. Beginning with the various towns of Belgium, so rich in architectural edifices, the excursions were gradually extended to neighbouring countries, and Lille, Cologne, Trèves, and Maestricht were visited in turn. More recently, London (in 1881) and Paris have been included, with the fine old châteaux of Pierrefonds and Coucy, and the splendid cathedrals of Rheims, Beauvais, and Amiens. In these excursions, one member in turn is charged with reporting the particulars, which now form a valuable collection.

The *Journal de l'Architecture* ceased to appear in 1855, and Belgian architects had then no periodical in which the progress of their art was recorded. In 1873, the Central Society founded their organ *L'Emulation*, which was at first conducted *con amore*, in the strictest sense, the various departments of reports, articles, autographic reproduction of drawings, and even the administrative and commercial portions, being undertaken by various members gratis. This publication, the whole series of which is exhibited, has, from small beginnings, attained a position of which the society may well be proud, and its future is now assured by the issue having been undertaken by a well-known art publisher, M. CLAESSEN, of Liège, Paris, and Berlin.

The society has not remained content with merely carrying out the programme traced by its founders, but has taken up the subjects of the rights and duties of architects, their emoluments, and architectural instruction commensurate with the exigencies of the period. It has also been thoroughly impressed with the value of competitions and exhibitions, having organised *concours d'étude* each year from 1877 to 1881, first among its members only and afterwards among Belgian architects generally. This year, with the support of the Government and the municipality of Brussels, the society has been enabled to offer prizes to the amount of 1,800 frs. (72*l.*) for the plans, sections, façades, and details of a high school of architecture. Nineteen designs were sent in to compete, and it was decided to exhibit them in connection with ancient and modern architectural drawings.

There is great difference of opinion abroad as to treatment in architectural designs. Some architects consider that the true architectural drawing should be simply an accurate design, without artistic effect, in support of which they point to the designs carried out in the Middle Ages and in still more remote periods, the drawing of which was so crude and yet the conception so grand. The society, however, takes a different view of the matter. Simple diagrams might, it considers, have sufficed for those grand old architects who devoted their whole life to one important structure, the details of which they could modify as it progressed, according to the effect produced, but too often, alas! dying before their dream was realised. Nowadays, however, the conditions are altered. Time is short, requirements are multifarious and often changeable. A problem is proposed, and must be solved definitely and at once, while the hard, unpoetical estimate must be fixed before a stone is laid. Now comes in the value of architectural design with all the effect that art can give. By means of perspective views, highly coloured and shaded, throwing into relief all the projections and giving due value to the recesses, a good idea may be formed of the effect to be produced by the work when finished. But at the same time the draughtsman must be sincere and conscientious in his work; he must give no meretricious display or fanciful effects of light and shade. In such a case he will only have himself to blame if his work falls short of the anticipation created by the designer. The society is of opinion that a judicious mean between the bare diagram and artistic effect is best arrived at by public competition and exhibition, and that architectural drawings should be exhibited by themselves and not in conjunction with brilliant paintings.

The present exhibition consists of two sections: first, the retrospective collection, of designs executed before 1830, either by Belgians or by foreign architects resident in Belgium, including edifices of the Middle Ages and the Renaissance period; and, secondly, the modern section, divided into thirteen classes, so as to afford better opportunity for comparison, and including the special competition above referred to. The appeal of the society has been well responded to, a great many public bodies and private individuals having lent valuable works for the first section, and Belgian architects having sent in nearly a thousand compositions for the second, without including the nineteen sets of drawings submitted for competition.

The value of the catalogue, admirably got up, by the way, is greatly enhanced by several pages being devoted to *fac-simile* reproductions of the signatures and handwriting of several of the artists represented in the retrospective collection. Thus we find some writing of the second half of the sixteenth century by HANS VREDEMAN DE VRIESE, and his signature in the year 1568. RUBENS has left so many examples of his art as a painter that one is apt to lose sight of the fact that he was also an architect. But the committee of the exhibition recall the fact by giving the first place to a set of sixteen designs, by that great master, of triumphal arches erected at Antwerp for

the fêtes to celebrate the joyful entry of FERDINAND of Austria in 1635. These are followed by two views of the "Hostel Rubens" at Antwerp, where the great painter lived during a portion of his varied career, and the ornamental arcade of which is reproduced in several of his compositions. In the year 1831, while the French army that came to assist the Belgians was besieging Antwerp, it was understood that great care would be taken not to bombard the cathedral. Fearing, however, that some stray shot or shell might destroy the work of so many years, the architect SERRURE, of Antwerp, took careful measurements of the tower, and made a fine drawing both of the elevation and the section, which are exhibited, as well as a design for the southern façade of the transept, by ABEL GRIMMER, inscribed, in 1592, as son to the Master of the Guild of St. Luke. This design does not greatly differ from the actual execution by the sculptors, ANDRÉ and JEAN COLYNS, of Nole.

The town of Oudenarde is represented only by a fine water-colour drawing, from which an engraving was made, of the Gothic Hôtel de Ville, with its remarkably florid ornamentation. The communal authorities of Bruges have sent a bird's-eye view of their city in 1562, printed from copperplates which still exist. It is very minute and exact in its details, and highly valuable from an archæological point of view, as it shows several public buildings which have long since been destroyed. They also contribute a drawing of the market, showing the *couronnement* which was designed in 1780 to replace the spire destroyed by lightning in 1741. The Bruges Academy of Beaux-Arts has lent a plan and perspective view of their central hospital, designed by TILMAN FRANÇOIS SUYS, while Belgium was under the French dominion, the only Belgian who gained the French Prix de Rome.

Brussels is, as might be expected, well represented. The archives of the municipality have yielded up three treasures, two of them being plans of the city, in which its old limits in the twelfth century can be distinctly traced. One, dedicated to the Elector MAXIMILIAN EMANUEL of Bavaria, is taken a short time after the bombardment by the French; and the other is extracted from a work entitled, "*Civitates Orbis Terrarum*," the publication of which was begun in 1572. The third is a view of the city from near the Porte d'Anderlecht about 1730. M. SCHOY has contributed three photographs of old drawings, showing the church of Notre Dame, Grand Sablon, as it appeared with its surroundings in 1615 and 1651, and also the interior on the occasion of the reception, by the Provosts of the Confraternity of St. CHARLES, of the Arch-Duchess MARY ELIZABETH, sister of the Emperor CHARLES VI., Governor-General of the Low Countries. M. MOLESCHOT has sent two views of the collegiate church of St. Michael and Ste. Gudule, while the city authorities have lent a drawing, by BAUERSCHIEDT, of the interior, on the occasion of the inauguration of CHARLES VI. as Duke of Brabant. There is also a good drawing of the celebrated pulpit, representing the *Fall of Man*.

Many are the illustrations connected with the historical Grand Place of Brussels, three engravings showing the beautiful Gothic Hôtel de Ville at different periods of its history. There is a plan prepared in 1564 for the reconstruction of a fountain adjoining the Brod-huis, or Maison du Roi, an engraving representing this edifice in 1646, and another as it appeared after the fire in 1695. The restoration of the celebrated building after the original plans is now nearly completed, including the following chronogram giving its date:—

A peste, fame et bello, libera nos, Maria Pacis  
HIC VoTVM paCIs pVbLICæ ELIZabet ConseCraVIt.

The houses in the Grand' Place—or, as it was then called, the Grand Marché—were nearly all destroyed in the bombardment by the French in 1695, as shown by an engraving lent by M. CH. NENTE, the secretary of the society. Five coloured drawings by DE RONS, dated 1729, 1738, and 1749, from the Brussels archives, show the houses of the various trade corporations as they existed in the eighteenth century. The houses have been so patched and altered in course of time, that it is intended to restore them in accordance with these very drawings, and during the present year 85,000 frs. (3,400*l.*) have been spent upon two houses alone.

Two picturesque water-colours by PUL represent the Porte d'Anvers and the Porte de Hal as they existed in 1786. The former has long since been demolished, but the latter has been restored, and forms a picturesque object near the Midi ter-

minus, besides serving as a museum of antiquities. Another view, after a drawing by the architect SUYS, shows the former Porte Guillaume, or Laeken Gate. Of the upper part of the city there are several engravings. One of them, dating from 1731, shows the Old Court of Brussels with its "bailles" or ornamental stone railing; while a pen-and-ink sketch represents the old palace taken from the park in the first half of the eighteenth century. A contrast is afforded by a perspective view of the Place Royale as it now exists, on nearly the same site. Some drawings of the church of St. Jacques-sur-Caudenberg, by the architect GUYMARD, served for carrying out its restoration in 1773. There is an engraving of the old Convent of the Augustins, erected by DE RONS (1738), of which only the church now remains, being used temporarily for the central post-office.

The communal authorities of Ghent have contributed some original drawings of the Hôtel de Ville by DE WAGHEMAKER and KELDERMANS, the great architects of the sixteenth century. This building is mainly Gothic, but one façade was constructed in the Renaissance style, this incongruity quite spoiling the effect. It is now proposed to carry out the original design, and these drawings will serve for the restoration. There is a copy of the original design for the Ghent belfry, dating from 1183, and a bird's-eye view of the city during the sixteenth century, made by DE NOTER. M. P. SAINTENOY, architect, Brussels, has lent the drawing of a tower supposed to have been designed by the two architects above named, DE WAGHEMAKER and KELDERMANS, for the church of St. Gommaire of Lierre. An interesting relic has been borrowed from the Musée Communal of Louvain, in a drawing on vellum by JOSSE, brother of QUENTIN METSYS, of the three towers intended for the principal façade of the church of St. Peter, Louvain. These towers were begun in 1507, under the direction of this architect, but were never completed.

The archiepiscopal city of Mechlin would naturally furnish abundant material of an archæological character, if it were only for the fine cathedral dedicated to St. ROMBAUT, the tower of which stops short, unfortunately, just above the clock. There is a design for the tower by ANDOCUS VERSLUYS, dated 1727; a drawing, with design for completing the spire, by J. B. DE NOTER in 1823, and another by J. HUNIN in 1828; while a view of the interior, by P. F. DE NOTER in 1809, is contributed by M. DE BRUYNE, of Mechlin. M. P. SAINTENOY, architect, Brussels, sends an engraving giving a *fac-simile* of the design for completing the tower, with the following note on the subject:—

According to Schayes, the magnificent tower of St. Rombaut was begun in 1452, and carried to its present height of 97 mètres 37 centimètres (nearly 319 feet 6 inches) at the beginning of the sixteenth century. The platform which crowns it ought to carry, according to the original design, an openwork stone spire, which would give the tower a height of 600 Mechlin feet. It is this spire which is represented in the engraving. The stones prepared for the work of completion were used in 1583 for the construction of the new fortress of Willemstad in North Brabant. The question of completing the tower was agitated a few years ago, but has been dropped on account of some doubt as to the stability of the lower portion.

There is a curious but effective drawing with a style on oiled paper, by J. B. DE NOTER, of the interior of the ancient church of the Jesuits at Mechlin. Among several pen-and-ink sketches and water-colours of various parts of the city by the same architect, a view of the bridge from the fish-market is very picturesque, and the House of the Fishmongers well worth attention. A view of the Hôtel de Savoye, where MARGARET of Austria died in 1530, is interesting, because the building has been restored by M. BLOMME, Architecte Provincial. A small drawing numbered 170, consisting of several minute water-colours of the old gates of Mechlin, executed by J. B. DE NOTER, is not only very picturesque, but also highly interesting archæologically, as giving a good idea of the military architecture of Flanders in the fifteenth century. In the same way an engraving of the old château of Odonck, by NEEFFS, shows the type of a Brabant country-house in the sixteenth century.

We have only noticed the most prominent of the many interesting contributions to this excellent exhibition, and the present article has attained such a length that we must leave all mention of the competition and modern section until next week. We would, however, observe that the many professional men who select this part of the year for a trip to the Continent

would do well to devote a day to this exhibition in the Palais des Beaux-Arts, Brussels, which is to remain open during September. Nor is it out of place to remind our readers that the Great Eastern Company have built a magnificent quay at Harwich, while the new arrangements at Antwerp admit of trains running direct from the landing-place; and the new steamer *Norwich*, illuminated by the electric light, is but an addition to the already fine fleet of steamers belonging to this enterprising company.

## CIRCULAR NOTES FROM FRANCONIA.—II.

[BY A CORRESPONDENT.]

THE Nürnberg folk like to remind a stranger that the first railroad laid down in Germany was on the few miles which separate their city from Fürth, the neighbouring manufacturing town, almost suburb, sometimes called the German Birmingham. The approach from this side awakes the traveller who is dreaming of mediæval times and straining his eyes for the towered walls and castle of Nürnberg, with abrupt recall to realities. Not only does flourishing Fürth cluster its tall chimneys and hide the sky with clouds of smoke, but immediately outside Nürnberg itself like abominations now furnish the most disillusionising of preludes to the picturesque home of DÜRER and SACHS, and of all the artist craftsmen who wrought into wood and stone and iron the cunning inventions of their brains. Here, however, the shock of modern incongruity ceases, and the carriage that conveys you to your hotel (and if you are wise that hotel will be the "Strauss") rumbles across a bridge over the dry moat, letting you have glimpse of a vista of grey walls draped with creepers, and through a massive town-gate into quiet streets that are still shadowed by the deep projecting roofs and high gables of the sixteenth century. It is no little satisfaction, after ten or fifteen years' absence, during which all kinds of discomposing reports as to the utter disfigurement of old Nürnberg have sounded in one's ears, to find that, after all, the town is so little changed, or, at any rate, that so much that is characteristic yet remains. Of course, the few wide streets that admit of a tramway have not been opened up without demolition of what was more picturesque if less convenient; and the decidedly improved sanitation of the place, although still none of the sweetest, has been secured by the loss of buildings which literally savoured of the past. A set of old prints of the town, brought out last century, show how many an old house has been pulled down to make room for public offices or the opening of small squares or garden enclosures, especially on the southern half of the Lorenz-Seite. The reason why these demolitions do not tell more to the destruction of the quaint and antique aspect of the town is that the new dwelling-houses and public edifices are for the most part built in the same style as those which have been destroyed; so that no startling anomalies exist such as make the streets of many an old town in England and on the Continent *chose pour rire*. We have, indeed, heard the innocent tourist in Nürnberg fall into sentimental ecstasies over some of these successful imitations of the domestic architecture of the sixteenth century, under the conviction that he was doing homage to the past.

One great change, and a change that cannot be deplored, is the laying out of the ground immediately beyond the city walls, for at least two-thirds of the circuit, in *allées* and garden, thus providing for a town which is too small and closely packed for interior gardens of any size—a pleasant and wholesome resort, and also serving to mask the environment of modern residences and manufactories. The walk round the walls is unique in its way, being not, as in many towns, on the ramparts, but beyond the moat or *Graben*. Thus you have the picturesque view of the walls themselves, their warm, soft, grey face tangled over with wilding bushes and creepers that have rooted in the crevices, or shadowed by the larger trees that have grown up in the dry, grass-grown moat. At frequent intervals the line of wall is broken by a round buttress tower or a more lofty watch-tower, with conical or steep roof in bright red tile, sometimes with corner turrets bracketed out. Every few yards gives a fresh picture as the walls and towers fall into perspective view, and group with glimpses of the distant Burg standing high at the northern angle of the town, or with the rich red-toned, deep-eaved, and many-dormered roofs of the houses within, with the purple spires of St. Sebald, or the ruddy towers of the

Lorenzkirche behind. On a summer's evening the whole scene glows with colour, and fascinates by a charm of varied and quaint forms, stamped with the marks of an historic past. The artist will find the older buildings of the Burg, the "five-cornered tower" (now consecrated as a "chamber of horrors" to a collection of instruments of torture), and the outer walls tell well from the northern circuit, while the most pictorial general views, such as we have just hinted at, are to be found on the west. Within the town ample material offers itself to the draughtsman and lover of the picturesque, although, it must be confessed, there is a look of having been "tidied up" about the place. Yet the brown and unsavoury waters of the Pegnitz are still overhung by quaint timber houses, with tumble-down double balconies and deep roofs: the island of the rag market, and the succession of bridges, the Karlsbrücke, the Henkersteg, and the Maxbrücke break up the vista on one hand, while the nondescript buildings and trees on the Insel Schütt divide the river to the east of the Museumsbrücke. The market booths still crowd the square beneath the rich façade of the Frauenkirche, which, redecored and furnished by zealous Catholics as a protest for the true church amidst Lutheran Nürnberg, has within lost much of its attraction from an antiquarian point, though doubtless Professor ESSENWEIN, Director of the Germanic Museum, has done his work with some taste, and far better than his predecessor HEIDELOFF, King LUDWIG's potent restorer. The Moritz-Kapelle is being repaired, and is eclipsed by scaffolding; all the pictures are removed to the Museum. So is, on loan, the famous portrait of *Holzscher* by DÜRER, formerly in a private house. Probably not many years will elapse before the mania for concentrating all art objects in one *omnium gatherum* of a museum, thus separating them from the surroundings and purposes for which they were devised, will strip the churches of the pictures and sculpture still left in place; the process has already begun. We should not be surprised to hear, for instance, that the Stations by ADAM KRAFFT were to be removed from Johannis Gasse, the road to the cemetery, where doubtless they suffer from weather and from the intrusion of dwelling-houses. As yet such sacrilegious kind of conservation is not talked of, and the dramatic and energetic reliefs of the Passion, which the pious citizen, MARTIN KETZEL, had set up towards 1489, keep the due places which he twice made pilgrimage to Jerusalem to measure on the holy way itself. Modern irreverence has built in several of the stations into the walls of the houses, which now have multiplied within the last decade into a suburb on either side the road, and much destroy the old peaceful character of the way to the Friedhof, where the great men of Nürnberg lie under their tombstones of stone garnished with wrought metal. The force and passion of KRAFFT's work strike one deeply at Nürnberg, where he did so much, but the conviction only increases upon one that his art, fine though it be and instinct with rough fervour, was always the art of the peasant and the craftsman; vigorous, narrative, but essentially homely, broad, and simple, full of personal experience of the working life about him in portraiture of his fellow men and their ways; having fire, indeed, but no ideal flame. In looking at the scenes from the Passion, we were curiously struck by reminiscence of a young, self-made artist at home, GEORGE TINWORTH, whose work in its disingenuous dramatic power seems like a reflex of the old Nürnberg school, curiously broken by modern modes of feeling.

There is one tomb in the Johannis Kirchhof which seems to pass unnoticed, and yet has a style and beauty quite apart. It belongs seemingly to the beginning or middle of the sixteenth century, but the names of the deceased (ULRICH is the first) and date are hard to decipher. It is a stone tomb, standing about three feet high; on the flat surface is extended a bronze crucifix, very finely chiselled, and bearing the character rather of Italian or Flemish work than of the local German school; the corners of the moulded cornice are bevelled away, and form a canopy for a little bronze kneeling figure of an angel with flowing drapery and pointed wings; the sides of the tomb are simply arcaded in low relief, on either side a small memorial tablet. Of the kneeling angels one is gone entirely—perhaps stolen or bought—one is headless, the two next the roadway are still entire. The position of this beautiful tomb, almost touching the iron enclosure of the cemetery, where the grass grows rank, and between the two gates, has perhaps caused it to escape notice; otherwise the beauty of the bronze sculpture and the tasteful simplicity of the design could hardly have

failed of comment. The figures may be of VISCHER's school, which was influenced by Italian art, but they look rather like the work of an Italian who has come in contact with northern thought, and gathered therefrom energy without losing the sweetness and grace of his native models. The heads are delicate in feature and full of expression, the limbs long, the body of the CHRIST rather exaggerated in attenuation, but entirely without the tendency to grotesque exaggeration of the German sculptors; the draperies of the kneeling angels are cast in free folds. Here, at any rate, is an example of precious art which should at least be recorded before it suffer further injury.

The use of metal decoration on the stone tombs in this churchyard, for over a century at least, is very striking and peculiar to the place. Inlay in metal is of course a practice pretty generally spread, but the Nürnberg mode is the placing of shields, medallions, and so forth, in high and even detached relief, in often elaborate designs of figures, scroll work and fantastic forms. Why next to none of the grand bronze monumental effigies in relief by VISCHER and his pupils, which are to be found in neighbouring towns, especially at Bamberg, appear to have been commissioned in his native city, is matter for curiosity. Next to his famous shrine, of which we have a fac-simile at South Kensington, these memorials were his finest products, and gave scope for individual treatment and cunning handiwork.

The guide-books are so full in their descriptions of Nürnberg that the reader might be justifiably impatient of comment now on what is pretty well known. The newest local guides were brought out last year, when the Bavarian Industrial Exhibition was held here, and the usual flourish of trumpets was blown over improvements of the town on the utilitarian side, which, as regards the pictorial aspect of the place, are all destructive. It is even said that the gateways and walls are threatened with further demolition. Already three gateways, the Wörderthor, the Lauferthor, except the round tower, the walls between them, and the Max Thor are gone. The great building—formerly an arsenal—now used as a customs house and store in the Königstrasse, with its memorable roof with six tiers of dormers, is to be done away with or restored; and probably many picturesque dwelling-houses and quaint corners will be swept off in the next few years, although the spirit of reverential conservation seems to protect the more important relics and to guide the renovations within the town. As yet the shopkeepers have not swelled into pride of plate-glass frontage, and we do not remember seeing in the streets a single instance of decoration by placards and flaming advertisements, graphic or otherwise. Some of the most important relics, the famous *Triumph of Maximilian* and other wall-paintings in an oil medium of DÜRER and his contemporaries, in the older portion of the Rāthhaus, are in a very bad state, and do not admit of easy restoration: indeed, they have already suffered from rough patching up at no remote period. Again, the stone of which many churches and public fountains are built—a sandstone—is very friable, and the amount of renovation already accomplished is enormous and rather puzzling, inasmuch as wear and weather stains soon give an antique appearance to the new work. If, on the whole, therefore, Nürnberg revisited is not wholly a disappointment, one's feeling of satisfaction is tempered by fears for the future, and by an uncomfortable consciousness that the alterations in the "old familiar face" are none the less real because so gradually and gently made.

As we drive out of the Thiergärtner Thor, bound for the hills of Franconian Switzerland, and look back over the pleasant fields, where the larks are at full song in the blue air, to the broken outline of the castle and the towers of St. Sebald, it is with a feeling that Mediæval Nürnberg will inevitably fall to pieces before the prosperity of a new future; that this waking dream, as it seems to us, of that wonderful *Blüthezeit* of four centuries ago, with its quickening into art and song, its curious invention and proud commerce, and its dark shadow of oppression and cruelty ever mocking the boast of freedom, will soon fade back into the invisible *Nirgendheim* of things that pass and leave no trace.

## PARIS NOTES.

THE Great National Exhibition, which will be opened on the 15th inst. at the Palais de l'Industrie, is attracting each day more attention from the public, who are now beginning to realise how important the undertaking is likely to prove in its effect upon art. As already announced in *The Architect*, this triennial exhibition is intended to collect and display a selection from the works produced during the three previous years, and as the number of exhibits is limited to 700 paintings, 300 sculptures, and 150 engravings, it will form a sort of critical appendix to the preceding Salons. For this occasion only all works executed during the past five years have been made eligible for admission, and an unexampled opportunity will thus be afforded for judging of the progress realised during that period by French art as a whole. The entrance is fixed at 2 frs. from nine to twelve, and 1 fr. from noon to five, admittance on Sundays and Thursdays being free.

The President of the Jury of Selection, M. Meissonnier, sends twelve works, ten of which have never hitherto been shown, and will certainly prove one of the greatest attractions of the exhibition. Portrait-painting will be represented by MM. Hébert, Cabanel, and Bonnat, the latter of whom shows eight works, three of them quite new. M. Henner contributes two new paintings, an *Andromede* and a *Grande Religieuse*—the head of the latter was exhibited last year. M. Cazin has a small work, showing the *Death Room of Gambetta*, which was exhibited lately at the Dudley Gallery; M. Henri Levy, the *Coronation of Charlemagne* and others; M. Guillaumet, *Jackals beside a Dead Body*; and M. Brozik, *John Huss*. Other exhibitors are MM. Jules Dupré—who has carefully kept his work aloof from the public for some considerable time—Bastien-Lepage, Bouguereau, Jules Lefebvre, Bréton, Harpignies, Lhermitte, and Berne-Bellecour. The chief sculptors are MM. Falguière, Mercié, and Lançon. M. Barrias shows a statue of Mozart when young, which is universally pronounced a masterpiece. The exhibition was visited last week by M. Jules Ferry, Premier and Minister of Fine Arts, who will preside at the opening ceremony on the 15th inst., when he will be supported by MM. Kaempfen, Director of Fine Arts; Poulain, Director of Public Buildings Department; Lafenestre, General Commissioner of Exhibitions; and Ollendorff, chief secretary of the exhibition.

The Luxembourg Museum was closed on the 31st ult. until the 11th inst. This measure was necessary in order to allow of the removal of those paintings and statues acquired by the State at the last five Salons, which have been admitted to the national exhibition above referred to.

Busts of M. Autran, of the Académie Française; of M. Perroud, sculptor, of the Académie des Beaux-Arts; and of M. Littré, of the Académie Française, have just been placed in the entrance-hall of the Institute. The Minister of Public Instruction has, moreover, ordered from M. Carlier a bust of the late M. Alexandre Hesse, member of the Académie des Beaux-Arts; and from M. Hiolin one of the late M. de Lasteyrie, member of the Académie des Inscriptions et Belles-Lettres.

The French School at Athens has already suspended for the season its archæological excavations at Delos. The fevers prevailing in the island and the neighbourhood of the cholera lazaret have, in fact, forced the director to stop work much earlier than usual. During the season, however, some important discoveries have been made, and these results will shortly be published in pamphlet form. A competition for three vacancies in the school will be opened next month; candidates must be under thirty years of age, hold the diploma either of Doctor of Literature or of Agrégé of Literature, Grammar, Philosophy, or History.

The nursery of French civil engineers and architects, the Ecole Centrale des Arts et Manufactures de l'Etat, whose present quarters are the old Hôtel de Thorigny in the Marais quarter, is to be transferred to new buildings in the Marché Saint-Martin. The change was fixed upon in principle some time back, but the execution has hitherto been delayed by the difficulty of finding a suitable site for the reception of the market. This has now been overcome by amalgamating the latter with the great Marché du Temple close by, a section of that large building being set aside for the accommodation of the dealers and stall-keepers affected. The Minister of Commerce is now, therefore, able to invite tenders for the buildings, which will be erected wholly at the expense of the State. In its new premises the school will almost touch the Conservatoire de

The Statue of Mr. Gladstone, which has been subscribed for by the members of the City Liberal Club, will be placed in its position in the hall of the club in the second week of October. The commission for the statue was entrusted to Mr. E. Onslow Ford.

Arts et Métiers, where are to be found very complete collections of instruments, models, and apparatus—in fact, a technological museum of very varied character. A still further advantage of this proximity lies in the opportunities that will thus be afforded to pupils of the school to attend the lectures on trade and commercial economy, that have lately been started at the Conservatoire.

In the exhibition of the Graphic Arts about to be opened at Vienna, the French section will be very prominent, the following great engravers and draughtsmen, among others, being represented: La Guillermet, eight engravings; Jacquet, four proofs; Gaillard, four designs for borders; Levy, several portraits; Flameng, eaux-fortes; Lalonne, twenty-four eaux-fortes; Waltner, sixteen engravings; G. Bellanger, fifteen engravings of Proudhon's works; Henriquel-Dupont, Despontins, and Jacott, various engravings. A further interesting feature of the section will be the collection sent by the Ministry of Public Instruction and Fine Arts, containing all the plates ordered of and executed by the Engraving Department (La Chalcographie) at the Louvre from 1833 to the present day.

### THE FUTURE OF ORNAMENT.\*

IT is the copyists, in fact, that are responsible for all that is wrong in our arts of design. They are the people who have pandered to the vulgar desire for all sorts of ornament at once, and as much of it as possible for the money. They have debauched all known styles by running them together without rhyme or reason, and they have lacked the imagination to create out of them a new style. They have applied their invention to contriving processes by which work which ought to be costly might be cheaply travestied, and to "adapting" to machinery the old patterns, all the beauty of which was due to their being wrought by hand.

All this is to be changed, and indeed is being changed under our eyes. The man who last year was satisfied with bad copies of fine things, only was not satisfied with any reasonable number of them, must now have originals. It has begun to be understood that machine work is poor and uninteresting; and, most important, our social life is taking form and demanding to find expression in those arts that have so long helped to obfuscate and disorganise it. A new spirit is creeping into the arts of design (beginning, as is right, with architecture) which must end in completely revolutionising them. Opinions differ about it, from that of the Georgia man who writes to the *American Architect* to say that the American mind requires "sky-scrapers," cheap elaboration, and Fourth-of-July sentiments expressed in stone and metal; who thinks that the art of the future will include wonderful combinations of dome and steeple, zinc roosters and spread eagles, and stars and stripes everywhere in red, white, and blue paint—from this gentleman's notions to the judgments of good architects who have endeavoured with some modification of the Romanesque or the early French Renaissance, to meet the requirements of our time and circumstances. The choice of these styles is suggestive, as they agree in using active rather than passive support.

If we can assume that the architectural style of the near future will embody our ideas of wholesomeness, active strength, vitality, and our common sense, unmythic views, the demand will soon be made on the decorator that he also give form and expression in his work to the same conceptions. We shall want more action than has been put into European ornament for a long period; a high vitality will demand pure and splendid colouring; a sound intelligence will see to it that the entire arrangement is understandable, governed by exact relations and definite canons of proportion. Neither Romanesque nor Gothic nor Renaissance ornament answers all of these demands. The first two systems contain too much of religious symbolism; the last, with all its beauty, is too flat, tame, and meaningless for our uses. In all the fine work of the Italian Renaissance there is visible a self-satisfied smirk, a look of greasy contentment which does not suit a sharp-set generation; and the livelier French styles were but the beginning of that wonderful artistic spree which the French people have been keeping up ever since the fifteenth century, but which they have not succeeded in getting other nations to participate in. We shall have to return to ornaments such as are common to all styles, based upon necessary structure and the capacities of materials, and are given beauty and character by the adaptation of proper natural forms. There are precedents enough to guide designers and others in making such a change. In many ways the present art movement is similar to that which brought Byzantine architecture to life, and re-modelled all Classic ornamentation at the beginning of our era. Then, as at present, among a great commingling of races, a new and freer life had begun, which had its say in a fresh and logical architecture, in the splendid colouring of mosaics, and in exuberant and

fanciful ornament. Variations of the old designs were made necessary by the new shapes of arch and dome and pendentive, but not less by the quickened feeling for a truth and power and grace that all could understand, and which, as much as any religious need, had produced the new forms of building themselves. The novel designs of the Byzantines show a closer and keener observation of nature than that of the ancient Greeks or Romans. The acanthus foliage of the capitals, from the soft and graceful ornament of the Greeks, became crisp and sharp, like the stronger variety of the plant. The rolling scrolls, borrowed from the Romans, were given life, growth, and variety. The vine especially (its significance in Christian symbolism made it specially important) became more like the natural vine than it has ever been before or since in decorative work. In a sketch of a portion of a ceiling at Ravenna, the grape-vine, with its large leaves and bunches of fruit, is not, it is true, so thoroughly naturalistic as modern French drawings from nature of sprays of the same plant, with leaves and their shadows, which admirably suggest an ornament but do not furnish one. But it states, nevertheless, a clearer and more virile conception of the nature of a vine. The top of the big boulder that overhangs the cave before described is clambered over by a Virginia creeper. It has this barren spot all to itself, and is at perfect liberty to run straight ahead over it, or to indulge in caprices and zigzags to any extent. It does both. It stops and gathers itself up occasionally to fling some budding sprays in the air; but, for the most part, it proceeds by the shortest road in search of nourishment. This double propensity of all vines struck the Byzantine workman as a useful thing to note about them. The grapes and the large leaves of the grape-vine he was interested in, both for their symbolic meaning and their decorative appearance; but the long bare coils of brown stem, and the sudden bursting out into leaves and tendrils which are characteristic of vines in general, these were still more to his purpose, and he was more earnestly bent upon reproducing them in his work than upon giving exact representations of foliage or of fruit. His barren lengths of stem he needed to frame in the lanky figures of his saints; the luxuriance of grape cluster and leaf and tendril served to fill the blanks between them. The resulting ornament is more like nature than the soft and regularly-foliaged vine-forms that preceded it. And it was the attention which the designers of early Christian times gave to the development of their own superior principles of elasticity and strength in construction that opened their minds to the perception of the same qualities in nature and enabled them to make such excellent use of natural forms in their decorations.

The new needs and ideas of life which have produced so many constructive problems which architects and engineers have found means to solve must soon begin to exercise an important influence on ornamental design. The artist in this way will have to put into his work some of the feeling for constructive truth, for economy of materials and of work, and for practical usefulness that is beginning to distinguish our architecture. He will be expected to enliven and beautify whatever he touches, without taking from its apparent strength and effectiveness—to add an elegance, a magnificence, a wealth of real meaning that without him the work would lack. In doing this he will doubtless have constant opportunities to base his endeavours upon the traditional forms whose uses and general significance are well known; but he will have to engraft upon them a new expression of force or grace, and to fit them for positions and purposes, not, in all respects, like the old. He may get on such points plenty of useful hints from the nature that surrounds him. Every twig and ground plant will furnish him with crestings and rosettes, every vine and creeper with new scrolls. He will find that at times it may be better to follow the leaf of the crow-foot or of the columbine than that of the acanthus, which he has never seen. The beautifully divided leaves of the dicentra and its pretty drooping racemes of two-horned white flowers might readily suggest the leafage and the flower ornament between the volutes of a capital. Curled ferns might answer for the volutes themselves, and the channelings of the shaft might be copied from those of the skunk-cabbage as it pushes up through the black mud in early spring.

In the meantime, and in the absence of a sound and living art, the student may find in nature exemplifications without end of the laws which should always govern the creation and application of ornament. In nature, most things owe whatever beauty of form they possess to perfect adaptation to their use and circumstances. An animal or plant which is only partly adapted to its conditions of existence is ugly in exact proportion to its lack of viability. In nature, any excess of force beyond what is needed for structural or functional purposes is immediately applied to the production of ornamental excrescences or fine colours. Ornament is turned again to use; the bright colours of flowers serve to attract insects; the markings of animals are for disguise or recognition, or to create fear or inspire affection.

The strictest utilitarian cannot find fault with the way in which the crane's bill and the meadow violet expend their surplus revenue in adding to their attractiveness. In their case, as in that of the dark chevrons of the chick-weed leaf and the white crescents of the clover, the distribution of the colour is guided both by the radiating or branching structure of leaf or petal, and by the distances from the source of supply. The leaves of the dog-tooth

\* From a paper by Mr. Roger Riordan in the *Century*.

violet, which have a framework of parallel veins bound together by cross veins, are spotted with dark colour in the centres of the rectangular spaces between them. These ornamental markings represent a remnant of force left over from the construction of the leaf, and not sufficient to flush it all with colour. They occupy the exact place where a good decorator would put them, close to the important points and lines, but seldom upon them. This relation of colour to vitality in its intensity and power, and to structure in its distribution, is very obvious in birds. The head, the gorge, breast, back, wings, and tail—the most important parts of the superficies—get the most of it. In the neighbourhood of these parts, at least in vigorous species, there is sure to be some accumulation of force, which shows itself in ornamental appendages like crests and gorgets and wing covers, or in striking colours, or both. The heads and necks of several varieties of pheasants show this very plainly, but it is easily observable even in our smaller and more plain coloured birds, in the tessellated wings of the hairy woodpecker, and in the painted eyebrows and quill feathers of the wood warbler. The colour is seldom applied upon the working parts. It is vague and diffuse on the larger, unimportant spaces. In feathers, it is at some distance from the shaft and between it and the edge that the darkest colour shows itself. In butterfly wings, the bands and spots show the same dependence on the general form and on the veining.

There is a strict analogy between all this and the way in which the work of decoration should always be carried on. In amount and intensity it should bear a relation to the importance of the work. Its distribution should be as if the builders or manufacturers, after the completion of the necessary portions of their work, would not rest at that, but proceeded to cover the contiguous spaces with decorations. Some such feeling has always regulated the distribution of ornament in every good period of art; and the corresponding notion that it is true economy, for either nation or individual, to hold surplus wealth in the form of splendid decorations, seems to have been general in all former periods of great social activity and power.

### THE MANCHESTER ART GALLERY.

THE Corporation Art Gallery in Mosley Street, Manchester, was opened on Friday in last week by Lord Carlingford. The building was formerly the Royal Institution. Under a private Act passed last year, the corporation took power to establish a permanent gallery of art for the city, and to devote to that purpose a sum of 2,000*l.* a year for twenty years out of the rates. The proprietors of the Royal Institution transferred their property to the corporation, reserving to themselves certain privileges and a number of seats upon the Art Gallery Committee of the corporation. This committee, formed partly of members of the council, and partly of governors of the old institution, will be the governing body of the art gallery, acting, of course, under the direction of the city council. The work hitherto carried on by the Royal Institution, including the holding of periodical loan exhibitions of pictures, and the delivery of scientific, literary, and other lectures, will be continued. Since the building came into the hands of the corporation it has undergone a series of structural alterations, and is now well adapted to the purpose it will in future serve. The nucleus of a permanent gallery of pictures is already in the hands of the corporation, who have also recently obtained by gift or purchase several valuable works of art.

Lord Carlingford, referring to the collection of paintings in the gallery, said: It is a happy thing for our present and recent art that those who are capable of buying pictures in this region have turned their attention that way. Some of you may remember the way in which Byron describes the taste of his somewhat profane hero, when he says that he turns from "grisly saints and martyrs hairy" to more pleasing subjects. Well, the princes of commerce and the chiefs of industry in this district have been sensible enough to turn away from indifferent pictures by old masters, and still more indifferent copies of good and great pictures by old masters, and they have devoted their taste and a share of their wealth to the purchase of the best pictures produced by the art of our own day, and illustrating the life of our own day. That is a most happy event, and I repeat that it makes Manchester, and the region that Manchester represents, of the greatest and most vital value to our present British art. A thought that occurs to me is that one would be glad if there were a greater demand than there is for pictures dealing with higher and more permanent subjects, works of art, especially of an historical character, illustrating the history of our own country in all its parts. That, however, is a class of art which must depend mainly upon the patronage and demand of public bodies rather than upon private individuals who desire capital pictures to hang in their drawing-rooms. For such a demand as that we must look rather to public bodies than to private persons, but it would be a great thing if public bodies were to imitate, as I trust they will in the days to come, the example which has been set by the corporation of Manchester, which has been fortunate enough to induce Mr. Madox Brown to adorn the walls of the town hall with his historical pictures dealing with the history of

Manchester. But, setting that aside, we all here may rejoice that Manchester has the attractive power of drawing within its walls so charming and interesting a collection of pictures as we see around us, and I trust that great numbers of your citizens will enjoy them for some months to come.

In the evening there was a *soirée* in the town hall, when Lord Carlingford again congratulated the citizens of Manchester on the possession of the gallery. He was glad that the art gallery was to contain something more than a collection of pictures—that the corporation had already obtained a valuable collection of specimens of textile art. The collection obtained from Dr. Bock was so good that it might have been intercepted by the department if duplicates had not been already in the museum. His lordship promised that the department would place in the gallery a most valuable collection of examples of silk manufacture, which had been received from the Chamber of Commerce of Lyons.

Mr. Slagg, M.P., said there was no doubt that the future industrial battle of the world would be fought out in a large measure upon artistic grounds. He thought it had far too readily been assumed, in regard to the industrial power of the people of this country, that their function in life was rather to turn out large quantities of commodities at cheap prices, than to invest them with the beauties and the glories of artistic design. That function and that department of industry had been relegated far too much to our better cultivated foreign neighbours. He dissented entirely from that, and he had the very fullest evidence, which recent opportunities had enabled him to obtain, that there were no industrial classes in the world better fitted than those of the United Kingdom to learn and to do all that related, not only to excellence of workmanship, but to excellence of art and design. We had not excelled in this direction because the people had not been taught. Although he very greatly sympathised with much that had fallen from Lord Carlingford in regard to the excellent system of art education which was now being carried on in this country, he could not quite agree with him in the satisfaction he expressed in regard to it; for he did not consider that it was by any means all that we should hope for or all that we should aim at. Nor could he quite think that we were equal to our Continental neighbours in this respect. He was deeply impressed with the view that in this country we hardly understand art education as it was understood in France and in Belgium. It would surprise many of those present to know the enormous proportion of artisans in those countries who learnt drawing, and not only drawing, but the higher branches of art, and not only in relation to special trades to which it applied, but also for the very love of the thing, and as a matter of general culture and education. He asked them, did such a state of things yet exist amongst our artisan class? and he thought they would be bound to answer that it hardly did. But he looked forward to the time when those opportunities and facilities should be afforded in such a degree that we should be not only equal to, but very soon excel, as we had all the means of being able to do, any nations with which we were brought into commercial rivalry.

Sir P. Cunliffe Owen said that when he went to the Paris Exhibition and asked the authorities in a very gentle way to give some more space for English fine arts they answered, "Why, you have no such thing as a British school. We don't know it in France." But when they saw that magnificent collection of pictures, and saw written over the door "British School," they were forced to acknowledge that there was such a thing as British art and such a thing as what was called an English style. The French were shown that in 1878, and when another international exhibition came round we should be able to show them still further that we could trust to ourselves; and that although we might have designs upon them, which we certainly had, in endeavouring to take from them their markets and to keep them for ourselves, we could also design for our own manufacturers if our manufacturers would only believe in themselves and in the designing power that there was in their own country. He knew it was a fact that the French people had their eyes upon our schools of art, and that they were watching the young men who were taking the prizes at the various schools of art. He would give the audience an instance of this. At Nottingham, a young student, who had taken many prizes in the school of art, received, before he got his last prize, an appointment from a firm for making designs in Paris, at 400*l.* a year. Now, if the French were not afraid of taking our students who were trained in our schools, did we not think our manufacturers might with that public spirit which Manchester was so distinguished for, encourage the school of art and the students who were taking that instruction which had been so freely offered to them.

Messrs. Whitfield & Co., of Oxford Street, Birmingham, have purchased the goodwill and patent rights of the Sicker Safe Company, and intend to carry on the manufacture of Sicker safes, in addition to those for which they are so well known.

A Company has been formed, with 100,000*l.* capital, entitled the Birmingham Artisans' Dwellings Company, for the purpose of providing healthy dwellings for the artisan and working classes in Birmingham and its suburbs. Mr. J. Cartland is the chairman.

## NOTES AND COMMENTS.

THE papers have announced that Mr. SMALMAN SMITH has been appointed to a judgeship at the Gold Coast. *The Architect* will in consequence lose the aid of a valued contributor. Mr. SMITH acquired a knowledge of architectural routine in his father's office, and his articles on law in relation to building had in consequence a practical character, which distinguishes them from the writings of other lawyers. It was that knowledge which enabled him to point out the shortcomings of a good many judicial decisions in building cases, and it is but fair to say that the decisions of Courts of Appeal and of the House of Lords have been sometimes anticipated in Mr. SMITH's articles. The Gold Coast does not appear to be the most fitting place for the exercise of so full a knowledge of technical law. Mr. SMITH has rendered good service to the Institution of Surveyors by his papers and assistance in the examination of associates.

THE programme of the congress of the Social Science Association, which is to be held in Huddersfield from October 3 to 10, has been arranged as far as regards "special questions." The subjects to be discussed in the Art Department are as follows: 1. Ought our museums and art galleries to be open on Sundays, and if so, under what conditions? 2. How can a school of art, as applied to textile and other manufactures, be best supported and utilised with a view to meeting foreign competition? 3. What constitutes a "school of music," and how far can the formation of an English school be encouraged? One of the questions in the section of Municipal Law is: Whether it is desirable that the Employers' Liability Act, 1880, should be amended and extended, with a view of securing and simplifying the remedy of the servant and preventing the servant from contracting himself out of the Act, and the master from insuring himself from liability under the Act.

IN Turkey three distinct classes of Smyrna carpets are recognised, according to the towns where they are manufactured. The thick-piled carpets, known in England as Turkey carpets, are made in Ushak. The trade, which is of considerable antiquity, has been largely developed since the Franco-German War. Twenty years ago there were 300 or 400 looms in Ushak; now there are at least 2,000, which employ the entire female population of the place. Nearly every house has its loom, and whole families are employed in the manufacture. The men prepare the materials, cleansing and dyeing the wool; the women comb it, spin the yarn, and work at the frames. There is no weaving in Turkey carpets. The strands are arranged vertically on an upright frame, and are tied together with woollen yarns of different colours to form the pattern, then combed down tight, and clipped to an even surface. The women get about 3*d.* or 4*d.* a day, the children still less, the men about a franc. The dyes used are madder, cochineal, indigo, yellow berries, and copperas, but, for economy's sake, aniline dyes are sometimes introduced. The colours are fixed with nitric, sulphuric, or muriatic acids. The Koula carpets are of both long and short pile, but thinner in texture and brighter in colour than those of Ushak. The demand for them is very limited, and the manufacture is almost confined to rugs. Ghiordes, like Koula, manufactures few carpets, but rugs of very bright hues, except those which imitate the subdued tones of Persian carpets. Ushak carpets of the best quality are worth about 13*s.* the square yard in Smyrna; those of Koula, 10*s.* or 12*s.*; and of Ghiordes, about 14*s.* The average yearly export of carpets is about 2,500 bales, reaching 125,000*l.* in value. England takes two-thirds of this export.

THE subscriptions to the Art Union of Glasgow during the past year have been disappointing to the committee of management. The decrease has been mainly among the provincial and colonial subscribers. All societies of the kind depend mainly for success upon the attractiveness of the engraving which is offered. This year the Glasgow committee issued an etching after M. ISRAEL'S *Frugal Meal*. But, however pathetic in treatment and expensive to produce, this work is not Scottish in character, and the Glasgow Art Union has been always most successful when the subjects were most national. The committee would seem to have some difficulty in finding subjects to engrave. When the number of pictures of Scottish

subjects exhibited every year is considered, the difficulty is almost incredible. It is to be hoped the Glasgow committee in their search for popularity will not be led away by the bad example of the London Art Union in engraving namby-pamby and sensational paintings.

MR. E. C. ROBINS lately delivered a lecture on "Modern Hospital Construction." It has been printed as a pamphlet, with the addition of plans and other illustrations. It is sold for the benefit of the Parkes Museum, but the price is only a shilling—a sum which is out of proportion to the quantity of excellent information which Mr. ROBINS has supplied in the pages.

THE reports by Mr. ARMSTRONG on Continental systems of art-teaching have had the effect of inducing the Science and Art Department to recognise the importance of night classes for art in Board schools. An experiment is to be tried for two years, with payments for results on the scale allowed for second-grade art classes. A circular has also been issued by the Science and Art Department, stating that, in order to encourage modelling of a very elementary character and to save the expense of casting and transmitting works to the Department, an examiner will be sent to hold annual examinations, in classes having an average attendance of ten students. In addition to the payment of 40*s.* for sixty attendances a year, a payment of 20*s.* to 25*s.*, according to the merit of the exercise, will be made on account of any student who has been satisfactorily taught, and who has attended at least forty lessons during the year. Some of the provincial School Boards have decided that drawing is to be taught in evening classes at a penny a week.

MR. AIKMAN, R.S.A., offered good advice to the visitors to the Kirkcaldy Fine Art Exhibition, which was opened on Monday last, when he advised visitors to study a picture at a time, and to discover if possible what was the artist's motive in painting it. The ambition of sightseers is to "do" an exhibition straight off, beginning with No. 1 in the catalogue and going regularly through the numbers to the end. But no advantage can be derived from this process, and, in consequence, visits to galleries are, in many cases, little more than a waste of time. Mr. AIKMAN also warned people against paying too much attention to the critics who write in newspapers. It would, perhaps, have been better if he suggested that the criticism should be tested in the gallery. Some writers may express erroneous opinions on pictures, but, speaking generally, painters have reason to be grateful to journalists. Many an English painter owes his position to notices of his work in daily and weekly papers, and it is possible that Scottish artists are also occasionally indebted to the press.

THE Manchester Art Gallery, which now belongs to the Corporation, has been enriched by some valuable presents. The first is Mr. HOLMAN HUNT'S *The Shadow of the Cross*, or as it is now called, *The Shadow of Death*, which is the gift of Messrs. AGNEW. It was painted in Jerusalem, and an immense sum was paid for it on its arrival in England. The picture was exhibited, and has been engraved in a costly form, but for some reason it was never so popular as some other works by Mr. HOLMAN HUNT. Another gift is Mr. VAL PRINSEP'S *The Golden Gate*—an Eastern woman standing against a gate, which is covered with Moorish ornament. Casts, drawings, engravings, and block prints have also been given, and a sum of 1,200*l.* has been already subscribed towards more purchases. The Corporation have resolved to be generous in their arrangements for the Gallery, so that all classes may be able to visit it at convenient hours.

THE session of the Birmingham and Midland Institute will commence on October 3, when an inaugural address will be delivered by Sir WILLIAM THOMSON. During the session there will be some lectures on art. The subjects are as follows: "Exotic Art," by Mr. J. H. CHAMBERLAIN; "The Public and Private Use of Sculpture," by Mr. E. W. GOSSE; and two on the "Gothic Revival," by Mr. WILLIAM MORRIS. In the archaeological section, of which Mr. TIMMINS is president and Mr. COSSINS secretary, there will be monthly meetings and exhibitions of collections.

## ILLUSTRATIONS.

BOUDOIR DECORATION.

THE original coloured drawing from which our illustration is taken was exhibited in the Royal Academy last season. It shows the woodwork throughout painted a rich sombre green, enriched in parts with flowers in red; the frieze, a pale green-blue, with sprays of flowers and leaves in dead gold and straw-colour, the cornice and picture-rail being picked out in harmonising tints; the wall filling-in, a ground of pale vellum-colour, with scroll pattern in warm dull yellows heightened with gold; the dado in deep-toned red, with the scroll-work in a lighter tone of the same colour. The design is by Mr. COLE A. ADAMS, F.R.I.B.A.

HOLY INNOCENTS' SCHOOLS, FALLOWFIELD, NEAR MANCHESTER.

THESE schools have been erected from designs sent in competition. Built of Yorkshire parpoints, with red sandstone dressings to harmonise with the church near which they are situated, they form therewith a picturesque group seen from the main road, up to which the schools extend. The school and class-rooms are so arranged as to be convenient for Sunday and daily use and also for all kinds of entertainments, the class-rooms being well placed to answer the purpose of cloak and retiring-rooms. The school is capable of seating over 400 people. The cost, including a platform capable of enlargement into a stage and proscenium, is 3,500*l*. The building was erected from the design of Mr. F. H. OLDHAM, F.R.I.B.A., 23 John Dalton Street, Manchester.

The sites for the schools and adjoining church were given by the late Lord EGERTON.

NEW TOWN HALL, NEWPORT, MON.

THE subject of these illustrations is a design sent in competition some time since, with about forty others, for the municipal buildings at Newport, Mon. The motto was "Caerleon," and the author, Mr. THOMAS M. LOCKWOOD, of Chester, to whom was awarded the second premium, the first being given to Mr. E. A. LANSDOWNE, of Newport, Mon.

After some little delay these two gentlemen were appointed joint architects, and the works are now being carried on by them, the general arrangement being the same as shown on the plans now illustrated, some slight changes having been made in the elevation towards Commercial Street.

The irregularity of the site, and the difference of levels, presented some considerable difficulties, but a glance at the plans will show that these have been fairly overcome and a good arrangement secured with plenty of light and air.

The basement plan contains the police-offices and thirteen cells, immediately behind the Commercial Street front, the difference of level from front to back, about 10 feet, admitting of the entrances to this department on the level of Dock Street.

The remainder of frontage to Dock Street and Austin Friars is devoted to fire-engine house, prison attendant's house, and various offices for nuisance inspector, cemetery clerk, School Board, &c.; the exigencies of the site also demanded an entrance to be left for access to premises in the rear originally terminating at the old line of street.

On the ground floor, accommodation is obtained for the municipal offices, with entrance from front and back streets, the council chamber, 42 feet by 30 feet, being placed at the angle of Dock Street and Austin Friars, having public entrance and gallery accessible from the latter.

The police-court is placed where shown on the plan, with entrance for public from Dock Street, and for magistrates and officials from the main street, the communication with the cells below being by a flight of steps from the basement leading directly into the dock.

The assembly-room is placed on the first floor over police-court and offices, occupying a space of 62 feet by 35 feet; it is 28 feet in height, and has two main entrances by means of broad stone stairs from the two streets before named, besides special entrances to the platform, and retiring-rooms for ladies and gentlemen adjacent.

The first stone of the building was laid in July last, and the works are being executed by Mr. JOHN LINTON, of Newport, whose tender, amounting to 23,121*l*., was the lowest.

The whole of the dressings to the lower streets, and the

entire front, with the tower in Commercial Street, is being executed in stone from the Grinshill quarries, near Shrewsbury.

The warming and ventilating arrangements are being carried out by Messrs. HADEN & SON, of Manchester and Trowbridge; the fireproof construction by Messrs. DENNETT & INGLE, of Whitehall, London; and the locks and special ironmongery by Messrs. CHARLES SMITH & SONS, of Birmingham, under the superintendence of Messrs. LOCKWOOD & LANSDOWNE, joint architects.

HOOD SCREEN, ST. LAWRENCE, ARDELEY.

THIS screen has recently been completed, and is, with the exception of the lower panels and gates, from the design of Mr. HUGH ROUMIEU GOUGH, F.R.I.B.A. It is worthy of remark that the carving of the whole of the tracery has been very ably executed by the Rev. JAMES SANDERSON, the fitting and carpenter's work being done by Mr. W. DARBY. The oak was supplied by Mr. LAWRENCE, of Datchworth.

HOUSES AND SHOPS, CLAY PIT LANE, LEEDS.

THE illustration shows a terrace of houses lately erected from the designs of Mr. WILSON, architect, Leeds.

DESIGN FOR BANK.

THIS student's design was submitted in the late competition for the TITE Prize at the Institute.

## PETER CORNELIUS.

IN these days of testimonials, and memorial busts, and statues of dead and living celebrities, says the *Times*, it is not a matter for surprise that the impending centenary of the birth of Peter von Cornelius is looked forward to in Germany as an opportunity for all manner of artistic pomp and circumstance. The painters of Berlin intend to hold high festival on the occasion, and there is little doubt that other cities of the Fatherland and of Austria will follow the example of the imperial capital. Vienna possesses in Hans Makart an artist whose talent is essentially of the decorative kind, and whose designs for a recent historic procession have met with less severe criticism than his colossal canvases; the Düsseldorf Artists' Club "Mahlkasten" is at least as famous for its delightful *fêtes* and garden parties in a locality hallowed by the memories of Goethe and the Jacobis as for the historic pictures painted by its members. And what more appropriate subject for the display of their gift could the painters of Düsseldorf, where Cornelius was born, or of Munich, where he created some of his noblest works, desire than the celebration of the father of modern German art? To that name Cornelius is entitled in more than one sense. It was he who, in conjunction with Overbeck—a man of more intense although much narrower genius than himself—originated that revival of painting which, although reviled and laughed at by Heine and innumerable other critics less witty, survived the scoffers, and ultimately became the germ of all that is likely to survive of contemporary German art. The "Nazarite" or "clerico-romantic" German painters who took up their abode in an old Roman convent, and astonished natives and visitors by their frescoes in the Casa Zuccari and the Villa Massimi, have been likened to the Pre-Raphaelite Brethren who revolutionised the art of this country many years afterwards, and there is no doubt a certain parallelism between the two phenomena. Both movements started in violent opposition to academic conventionalism, which they combated by an appeal to nature and to the Mediæval representatives of a thorough-going, albeit unconscious realism. Overbeck and his friends were, indeed, expelled the Academy of Vienna, just as the walls of Burlington House knew not the pictures of Rossetti until death had removed him from the sphere of rivalry and contention.

With this essentially negative feature the affinities of the two schools cease, and differences of the most vital kind meet the eye of the careful observer. The German painters, although they thundered against the frivolity and want of spiritual depth in Rubens and Correggio, never showed real sympathy with their early Italian models. Even Overbeck, ascetic as he was, could not withdraw himself from the influence of the Renaissance. His draperies and his poses were founded upon those of Raphael—the early Raphael, it is true—and, like that master, he clothes his saints in the togas of Roman senators. The introduction into Biblical subjects of Eastern costumes after the manner of Mr. Holman Hunt would have appeared to him irreverent, if it had occurred to him at all. Whatever in him and in Cornelius is Mediæval is German, not Italian. And even this German Mediævalism is less pronounced in the two founders of the school than in some of their followers, as, for example, in Rethel, one of the greatest draughtsmen modern Germany has produced, although

the quaintness of some of his designs foreshadows the madness which finally clouded his genius. Again, the Pre-Raphaelites were essentially colourists; the colour of the Germans was as abominable as their draughtsmanship was exquisite; in most of their frescoes they spoiled the beauty of their cartoons. Cornelius, more especially, was a master when he had pencil or charcoal in his hand; as soon as he took up the brush he sank below the level of the scene-painter. It may finally be pointed out that the sympathy with religious subjects which with our English school was of a superficial and merely artistic kind became the life-breath of some of the German masters. Overbeck, in his life as well as in his work, was a Mediæval ascetic of the most rigorous kind. The spirit of classical art he abhorred, and its form he tolerated only on the same principle as the children of Israel, "employed the gold and silver vessels which they brought with them out of Egypt in the service of the true God in His Temple, after melting them down and consecrating them anew." To this length of religious fervour Cornelius, however, declined to follow his great friend. His love of the beautiful was not confined to one creed or one country, and at the bidding of the art-loving Crown Prince, afterwards King Ludwig I., of Bavaria, he was quite prepared to cover the walls of the Glyptothek with the glories of Zeus and the wrath of Achilles. But in spite of his classical leanings, Cornelius was never at home among the gods of Olympus. He remained a German and a Christian painter. This becomes at once apparent if one compares the frescoes of the Munich Glyptothek with those in the Ludwigskirche of the same city, or, better still, with the cartoons for them, which are in the Berlin National Gallery. Here the subject is thoroughly congenial to the artist, and the terrors and hopes of Christian revelation have seldom been rendered in a more impressive and at the same time strictly reverential manner than in the *Last Judgment*, said to be the largest, as it certainly is one of the most powerful, frescoes in existence. The acme of Cornelius's religious art was reached in the designs for the Royal Mausoleum or Campo Santo of Berlin, which have never been executed in colour, and remain, perhaps for that reason, the finest and most representative specimens of the master's style. The scale of these compositions was intended to be as colossal as their idea was comprehensive and full of meaning. The pictures were to be divided into groups of three, and the entire series was to embody the victory of Christ over death, spiritual and physical, and many of the most important episodes of the New Testament. The variety of pictorial resource, the grandeur and depth, and the beauty of some of the compositions place these cartoons among the foremost achievements of modern art. In the *Apocalyptic Horsemen*, more especially, dramatic power of the highest kind is displayed. Cornelius never surpassed—never, indeed, equalled—this design. The great scheme remained unaccomplished at the painter's death; the sketches for all the pictures are extant, and some of the cartoons were finished in detail and on a large scale. Perhaps the empire of Germany will complete what royal Prussia left undone. No nobler monument to the artist's genius could be erected than to transfer these designs to the walls of a great national building and to carry the painting out in a better style, perhaps, than he himself would have been capable of.

By his own countrymen Cornelius is classed among the greatest painters of all times, but international art history is not likely to endorse this verdict. His grave deficiencies as a colourist, the occasional hardness of his design, and a certain want of grace, although national rather than individual faults, will always be felt by those who look upon art as an embodiment of beauty rather than of thought and scholarship. His position as the unrivalled head of the modern German school he owed to his personal no less than to his artistic qualities. Overbeck lived the life of a recluse. The hours which he could spare from his religious observances he spent in his studio, surrounded by a few admiring disciples. Cornelius was a man of the world, fond of society, and an excellent talker. He loved Italy and Italian life, and from among the Italian people he chose a wife at an age when most men have done with the hopes and pleasures of existence. His mental faculties remained unimpaired to the day of his death, and few people who heard him talk in his lively, excited manner, on his art or literature, or, it might be, the rhythm of a tarantella which he had seen the peasants dance in Capri, would have suspected that they were listening to one who was all but an octogenarian, and had passed through such a career of work and excitement. Unlike most painters, moreover, Cornelius took a keen interest in contemporary events, and held, or was suspected to hold, strong political views of his own. During the famous "conflict" between the Prussian Diet and Bismarck a very scurrilous drawing appeared in one of the Conservative papers, showing the president of the popular Chamber in an anything but dignified attitude. This rumour assigned to the pencil of Cornelius, with how much truth we are unable to say. It will be seen that the biographer of Cornelius, whose task, in spite of numerous attempts, remains unaccomplished, will have an interesting problem to deal with. In the meantime the Germans are fully justified in delighting to honour the memory of a painter who was remarkable alike for his individual genius and for the impetus which that genius gave to the art of his country.

## RECENT BUILDING IN NEW YORK.\*

THE new departure is an apt name for what some of its conductors describe as the new "school" in architecture and decoration. It has still, after nearly ten years of almost complete sway among the young architects of England and of the United States, all the signs of a departure—we might say of a hurried departure—and gives no hint of an arrival, or even of a direction. It is, in fact, a general "breaking up" in building, as the dispersion of Babel was in speech, and we can only and somewhat desperately hope that the utterances of every man upon whom a dialect has suddenly fallen may at least be intelligible to himself. From a "movement" so exclusively centrifugal that it assumes rather the character of an explosion than of an evolution not much achievement can be looked for. In fact, the "movement" has not, thus far, either in England or in the United States, produced a monument which anybody but its author would venture to pronounce very good. Not to go back to the times when Gothic architecture was vernacular in England, it has produced nothing which can be put in competition with the works either of the English Classical revival, or with the works of the English Gothic revival—with St. Paul's and the Radcliffe Library, on the one hand, or with the New Law Courts and the Manchester Town Hall, on the other. Before the "movement" began, the architects of Europe and America were divided into two camps. They professed themselves either Renaissance or Gothic architects. The Mediævalists acknowledged a subjection to certain principles of design. The Classicists accepted certain forms and formulæ as efficacious and final. They were both, therefore, under some restraint. But the new movement seems to mean that aspiring genius shall not be fettered by mechanical laws or academic rules, by reason or by revelation, but that every architect shall build what is right in his own eyes, even if analysis finds it absurd and Vitruvius condemns it as incorrect.

"Queen Anne" is a comprehensive name which has been made to cover a multitude of incongruities, including, indeed, the bulk of recent work which otherwise defies classification, and there is a convenient vagueness about the term which fits it for that use. But it is rather noteworthy that the effect of what is most specifically known as Queen Anne is to restrain the exuberances of design. Whoever recalls Viollet-le-Duc's pregnant saying, that "only primitive sources supply the energy for a long career," would scarcely select the reign of Queen Anne out of all English history for a point of departure in the history of any one of the plastic arts. The bloated Renaissance of Wren's successors, such as is shown in Queen's College and in Aldrich's church architecture in Oxford, was its distinctive attainment in architecture. The minute and ingenious wood-carving of Grinling Gibbons was its distinctive attainment in decoration. Nothing could show more forcibly the degeneracy of art at the period which of late years has been represented as an æsthetic Renaissance than the acceptance of these wood-carvings, which in execution and all technical qualities are as complete, and in design and all imaginative qualities are as trivial and commonplace, as contemporary Italian sculpture, as works of art comparable to the graceful inventions of Jean Goujon, and clearly preferable to the sometimes rude but always purposeful decoration of Mediæval churches.

The revivalists of Queen Anne have not confined their attentions to the reign of that sovereign. They have searched the Jacobean and the Georgian periods as well, and have sucked the dregs of the whole English Renaissance. Unhappily, nowhere in Europe was the Renaissance so unproductive as in the British Islands. It was so unproductive, indeed, that Continental historians of architecture have scarcely taken the trouble to look it up or to refer to it at all. Not merely since the beginning of the Gothic revival, but since the beginning of the Greek revival that was stimulated by the publication of Stuart's work on Athens, in which for the first time uncorrupted Greek types could be studied, what contemporary architects have ransacked as a treasury was considered a mere lumber-room, and fell not so much into disesteem as into oblivion. During two generations nobody any more thought of studying the works of English architecture, from Hawksmoor to "Capability" Brown, than anybody thought of studying the poetry of Blackmore and Hayley. The attempt within the past ten years to raise to the rank of inspirations the relics of this decadence, which for years had been regarded by everybody as rather ugly and ridiculous, is one of the strangest episodes in the strange history of modern architecture.

Mr. Norman Shaw has been the chief evangelist of this strange revival. Mr. Shaw is a very clever designer, with a special felicity in piquant and picturesque groupings, which he had shown in Gothic work, especially in country-houses, before the caprice seized him of uniting free composition with Classic detail, and the attempt at this union is what is most distinctively known as Queen Anne. Whoever considers the elements of this combination would hardly hope that the result could be a chemical union, or more than a mechanical mixture. Classic detail is the outcome and accompaniment of the simplest con-

\* From an illustrated article by Mr. Montgomery Schuyler in *Harper's Magazine* for September.

struction possible, which was employed by the Greek architects in the simplest combination possible, and precisely because it was so simple and so primitive they were enabled to reduce it to an "order," and to carry it to a pitch of purity, lucidity, and refinement to which the most enthusiastic Mediævalist will scarcely maintain that more complicated constructions have ever attained. But this very perfection, which was only attainable when life was simple and the world was young, this necessary relation between the construction and the detail of Greek Doric, makes it for ever impossible that Greek detail should be successfully "adapted" to modern buildings. The latest and strongest of the writers on the theory of architecture has said of Greek architecture: "As partisans of its historical glory we should desire that it remain for ever in its historical shrine." We laugh at the men of two generations ago who covered Europe and America with private and public buildings in reproduction as exact as they could contrive of Grecian temples. But, after all, if the Greek temple be the ultimate, consummate flower, not only of all actual but of all possible architectural art, were not these men wiser in their generation than their successors who have taken the Greek temple to pieces and tried to construct modern buildings out of its fragments? There is even something touching and admirable, in this view, in the readiness and completeness of the sacrifice to beauty which the reproducers of the Greek temples made of all their merely-material comforts and conveniences, something that we miss in the adapters. The Romans can scarcely be said to have attempted this adaptation. They built Roman buildings for purposes and by methods which had never entered the minds of Greek architects to conceive, and they built them with no more thought of art than enters the mind of a modern railway engineer in designing a truss bridge. After they were designed according to their requirements the Roman engineer overlaid them, or, according to some conjectures, employed Greek decorators to overlay them, with an irrelevant trellis of Greek architecture, debasing and corrupting the Greek architecture in the process. And it is this hybrid architecture, which analysis would at once have dissolved into its component parts, that was accepted without analysis as the starting-point of "the new departure" of the fifteenth century, and the ultimate English debasement of which in the eighteenth is taken by the contemporary architects of England and America as the starting-point of the new departure in the nineteenth. It cannot be said that Mr. Norman Shaw and his followers have succeeded in the task of combining free composition with Classic detail, which the Romans forbore to attempt, and in which the French architects of the sixteenth century failed. Every attempt to fit antique detail to a building faithfully designed to meet modern requirements shows that it cannot be so fitted without being transformed, and—since the sole excuse for the attempt is that it cannot be bettered—without being debased. What the Queen Anne men have done is virtually what the Romans did. They have shirked the impossible problem they unnecessarily imposed upon themselves, and have either overlaid or inlaid their buildings with their architecture. Of course the result of this process can no more be accepted as an architectural organism than if they had hung waterproof paper on the outer walls instead of decorating them with carving or moulding or what not, built in the walls, but no more architecturally related to them than the paper-hanging. But this is precisely what has been done in every "free Classic" building, with more or less skill and dissimulation of the process.

However, to disparage Queen Anne is not to explain its acceptance. It looks like a mere masquerade of nineteenth-century men in eighteenth-century clothes, and with many of its practitioners it is no more. In England it seems to have originated as a caprice by which a clever and dashing but by no means epoch-making architect misled the younger and weaker of his brethren. In this country, which has never been much more architecturally than an English colony, there seemed special reasons for following the new fashion of being old-fashioned. American architects, and American builders before there were any American architects, had been exhorted, as they have lately been exhorted again, to do something distinctively American. The colonial building, which was done by trained English mechanics, was of the same character as the contemporary domestic work of England, and showed in its ornament the same unreflecting acceptance of a set of forms and formulæ bequeathed as a tradition of the trade and part of the outfit of a journeyman. Although Jefferson complained that in his time and in rural Virginia it was impossible to "find a workman who could draw an order," it is evident that there was no difficulty of that kind in other parts of the country. These trained workmen, it is to be noted, were all carpenters, and there is probably no work in stone which shows an equal precision and facility in workmanship. Such buildings as the New York City Hall and the Albany Academy were clearly the work of architects of culture according to the standard of the time. The only architectural qualities of the works of the mechanics were the moderation and respectability of detail, which they had learned as part of their trade, and it is quite absurd to ascribe to these buildings any value as works of art. It is particularly absurd to assign the degradation of house-building which undoubtedly followed, and which made the typical American house, after the Greek temple

had spent its force, the most vulgar habitation ever built by man, to the substitution of book-learned architects for handicraftsmen. People talk as if the middle part of Fifth Avenue, the brown-stone high-stoop house with its bloated detail, which displaced the prim precision of the older work, had been done by educated architects. In fact, there was probably not a building put up in New York after the design of an educated architect between the works we have mentioned and the erection of Trinity Church by Mr. Upjohn in 1845, which not only marked a great advance over anything that had been done before, but began the Gothic revival to which we directly or indirectly owe whatever of merit has been done since, including so much of Queen Anne as, not being Queen Anne, is good. But the bulk of the building which gave its architectural character to New York and to the country continued to be done by mechanics, who continued, so far as they could, to supply the demand of the market, who gradually lost the training their predecessors had enjoyed, and who lost also all sense of the necessity for that training in the new demand that their work should be, above all things, "American." As the slang of to-day puts it, they were exhorted as the architects are still sometimes exhorted, to "talk United States." They might have answered that there was no such language, and that a few bits of slang did not constitute a poetical vocabulary. The feeling which urges an artist to be patriotic by being different from other people, not long ago led Mr. Walt Whitman to resent the absence of an "autochthonous" poetry, and has lately led a newspaper writer to call the attention of a New England building committee to the log cabin as the most suitable motive for a town hall they are going to build.

The Northern reader notes with mild amusement the occasional resentment in the Southern press of the absence of a "distinctive Southern literature," and perceives the plaint to be provincial; but he is not so quick to perceive that his own clamour for an American this or that is equally provincial. The hard lot of the American painter has lately been bewailed, in that, when he has tried to rid himself of his provincialism by learning to paint, and has learned to paint more or less as other men do who have learned to paint, he is straightway berated for not being provincial. If American literature or painting or architecture is good, the Americanism of it may safely be left to take care of itself. But a man cannot be expected to innovate to much purpose upon usages with which he is unfamiliar; and the effects which Mr. Whitman's admonition to his fellow-poets to "fix their verses to the gauge of the round globe" would probably have upon an aspiring young poet, conscious of genius, but weak in his parts of speech, are the effects which the demand for aboriginality actually had upon the race of builders, whether they were content with that title, or without any sufficient provocation described themselves as architects. They undoubtedly attained difference, and their works did not remind the travelled observer of any of the masterpieces of Europe. It is quite conceivable and not at all discreditable that the wild work of Broadway and of Fifth Avenue should have led architects of sensibility to cast many longings, lingering looks behind at the decorum of the Bowling Green and Washington Square, and to sigh for a return of the times when the common street architecture of New York was sober and respectable, even if it was conventional and stupid.

This justifiable preference for Bowling Green and Washington Square and St. John's Park over Broadway and Madison Square and Murray Hill, for an architecture confessedly colonial over an architecture aggressively provincial, is no doubt the explanation why so many of our younger architects made haste to fall in behind the Queen Anne standard. What we really have a right to blame them for is for not so far analysing their own emotions as to discover that the qualities they admired in the older work, or admired by comparison with the newer, were not dependent upon the actual details in which they found them. To be "content to dwell in decencies for ever" was not considered the mark of a lofty character even by a poet of the time of Queen Anne. If virtue were, indeed, "too painful an endeavour," and if there were no choice except between the state of dwelling in decencies and the state of dwelling in indecencies for ever, we could but admit that they had chosen the better part. But they were not, in fact, confined to a choice between these alternatives. The Gothic revival in England, after twenty years, had succeeded in establishing something much more like a real vernacular architecture than had been known in England before since the building of the cathedrals—an architecture which, although starting from formulas and traditions, had attained to principles, and was true, earnest, and alive. It was quite inevitable that it should be crude in proportion as it was alive, according to the frankness with which it recognised that we live in times unknown to the ancients, and endeavoured to respond with changes in its organism to changes wrought in its environment by new requirements and new knowledge, with forms necessarily rude, inchoate, embryonic, as beseems the formative period of letters and of arts as of life, in contrast with the ultimate refinement which is the mark of a completed development. But that these crudities would be refined was also inevitable; that they were in process of refinement was apparent. Another generation of artists as earnest as those who began the Gothic revival might have brought this rough and swelling bud to

a splendid blossom. But in an evil hour, and under a strange spell, the young architects of the United States followed the young architects of England in preferring the refinements of a fixed and developed architecture to the rudenesses of a living and growing architecture. Because they did not see their way at once to "supply every deficiency and symmetrise every disproportion," they did not leave this for their successors, but abandoned the attempt at an expression of the things they were doing for the elegant expression in antique architecture of meanings which have grown meaningless to modern men.

They have had their way in New York for seven or eight years, during a period unprecedented in building activity, and out of all comparison in the profusion with which money has been lavished upon building and decoration. What have they gained for architectural art? They have, indeed, subjected many miles of sandstone to the refining influence of egg and dart mouldings (the designer of a house in Fifth Avenue has so much faith in the efficacy of that ornament that he has belted his street front with three rows of it, one above the other), and triglyphs (faithfully to have contemplated which softens the manners nor suffers to be rude) have been brought within the reach of the humblest in the decoration of tenement houses. They have built so much and so expensively that they have produced in minds—like some of their own—which do not reflect much upon these things, the impression that if luxury and art are not synonymous, they are at least inseparably connected, with the latter in the capacity of hand-maiden. But will any educated architect assert that the characteristic monuments of the last five or six years, greatly superior in quantity, and superior by a great multiple in cost, are equal in architectural value to the work of the decade preceding? Suppose that Mr. Norman Shaw had not bedevilled the weaker of his brethren, and that this unprecedented building activity and this unparalleled spending of money that have fallen under the control of architects had been directed along the lines laid down by the Gothic revivalists, and had extended, consolidated, and refined the work begun and carried on here by such architects as Mr. Upjohn, Mr. Eidlitz, Mr. Withers, Mr. Cady, Mr. Potter, and Mr. Wight, will any educated architect maintain that the result of such a process would not have been nobler monuments than any to which we can point as characteristic products of the later movement?

### THE ROMAN HOUSE AT WHITESTAUNTON.\*

WHEN the society did me the honour of visiting Whitestaunton last year we were so fortunate as to discover the remains of a Roman house situate beside the stream which rises in the large fishpond, and flows down into the valley of the Yarty. The existence of the ruins of a villa in the immediate neighbourhood of the stream had long been suspected, owing to the frequent occurrence on its banks of minute fragments of an ancient kind of pottery and of stone split into thin sheets and cut into the shape of roofing-tiles. When the course of the high road was altered about forty years ago the ruins of a little room or chapel, roofed with these slabs and paved with *tesserae* of brick, were found standing over a clear spring in the wood, not far from the stream in question, and within a few yards of the back north wall of the house which has now been discovered. At the time of the society's visit we had not found much more than the sandstone pillars, which had supported the flooring over a hot-air chamber, some of the square, box-like flue-pipes which had let the warm air through the walls of the dwelling-rooms, a quantity of broken tiles, and the foundations and lower courses of some of the principal walls. A good deal of work was done in the course of last autumn and in the spring of this year, under the superintendence of Major Davis, F.S.A., who was so good as to direct the operations, which could hardly have succeeded at all without the benefit of his great experience in everything relating to Roman antiquities of this kind. The plan prepared by him shows the result of the excavations so far as they have at present proceeded.

The house was built under a steep hillside facing to the south, though the windows looking down the valley westwards must certainly have afforded the finest view. The bath-rooms were on the western side, and the principal living rooms were arranged round the *atrium* or covered court at the eastern end. The centre of the house was occupied by a furnace-room, probably adjoining the kitchen; and here were the boilers which supplied the warm bath and steam for the vapour-bath, taken in a heated chamber from which the bathers must have passed into a room containing the cold plunge-bath lying further to the east. The hot-room terminates in a semicircular recess, paved with square red tiles embedded in concrete, several lines of thicker tiles radiating from the centre of the room towards the curve of the recess, where they reached the wall and formed a support for the *solium* or bench where the bathers sat. On the further side of the furnace-room, flues and underground passages for hot air, lined with thick tile work, led to another semicircular room at the back, containing

a number of red sandstone blocks, intended apparently to support the fireplace, the doorway and a seat or projection from the wall, and towards the front to another room adjoining the *atrium*, where a huge slab of much discoloured sandstone marks the position of another large hearth or fireplace. One is reminded at this part of the excavations, if we may compare small things with great, of that vivid description of the ruins of the City of Legions, which we find in the "Welsh Journey" of Giraldus, where he tells us how Caerleon "was excellently built by the Romans with their walls of brick," and how even in his day were to be seen the traces of its former greatness, the giant tower and the palaces "aping the Roman majesty" with their roofs of antique gold, "and the traveller," he adds, "within and without the city finds underground works and pipes and winding passages and hypocausts, contrived with wonderful skill to throw the heat from little hidden flues within the walls." The *atrium*, or inner court, which was probably roofed in to escape the inclement weather of the "land of clouds and rain," was surrounded by a cloister or gallery, opening at the back upon a large archway, of which the ruins lie in a mass of masonry upon the floor. On the eastern side of the arch there is an alteration of level in the floor of the little cloister, and here there are remains of a step and a doorway and another slab of sandstone in the corner, which seems to indicate the position of another stove or fireplace. The cloister was evidently supported by pillars, of which two were found lying by the wall at the corners of the court, and another had been displaced and thrown to some distance beyond the outer wall. Owing to the dampness of the soil, which necessitates a tedious course of draining, we have not yet examined much of the flooring of the *atrium* and its surrounding cloister; but enough has been uncovered to show that the passage at least was floored with fine mosaic work, bordered with the pattern called the "double key," the cubes being made of terra-cotta, white lias, and the darker stone of the district, so as to afford a variety of colours in the pattern. The pavement of the large room between the outer wall of the *atrium* and the sloping wall shown on the plan appears from the few fragments left to have been of the same fine quality, the cubes measuring about a quarter of an inch on every side; in the other rooms and passages the pavement was of a rougher and coarser kind. On passing through the opening for the large archway we come upon three small rooms, paved with concrete, in which a few *tesserae*, about an inch every way in size, are still in position. Some parts of the wall retain pieces of the stucco or plaster, of a red or maroon colour, striped with white lines, with which the surface was originally covered. But the dampness of the soil led to the destruction of the greater part of the plaster work, which fell off in an almost fluid condition, when the stones were first exposed to the air. Mr. Wright, in his work on "The Celt, the Roman, and the Saxon," has observed a peculiarity of the Roman houses in this country, of which the middle room of the three last-mentioned affords a new illustration. "One room," he says, "has always a semicircular recess or alcove, and there is generally at each side where it joins the room an advancing piece of wall or pier, as though a curtain had been drawn across to separate the recess from the room." And, he adds, that it has been conjectured that this recess served as the *sacrarium* or place of domestic worship.

There are one or two other points about the building which seem to be worthy of observation. The construction of the arches appears to have been similar to that of the larger archway which Major Davis has discovered among the Roman ruins at Bath, the masons having for the sake of lightness used "brick wedge-shaped boxes open on two sides," set in a cement of lime and pounded tiles, and roofed in with a "roll and flat tile," or thin stones cut into a hexagonal shape. The stones of the east wall of the *atrium* are scored over with "diamond-broaching," like the masonry of Hadrian's wall. The tiles are of all sizes and shapes, some being flanged for roofing or for use in the hot-air flues, others being rounded for the ridges of the roof, which seems to have been made in part of stone flags and in part of the thick slate which is found at Wiveliscombe. The boxlike flue-tiles are pierced with square holes and scored with lines, so as to get a firmer hold on the mortar. In one or two places where the supply of red sandstone pillars had fallen short, some of these flue-tiles were filled with cement and set up on end so as to serve as supports for the floor. Several of the tiles show marks of footsteps impressed on them while the clay was wet, the marks in one case showing the nails of a man's boot, and in another the footstep of a large dog. There has not as yet been an opportunity of thoroughly examining the ground, the earth being left for some inches over the greater part of the floor; but some objects of interest have already been found, the list including several coins of the fourth century, part of a bronze brooch, part of a glass bowl, several pieces of the fine red Samian ware, a vast quantity of bones, and a number of broken articles of the black, red and grey pottery which was manufactured in Britain. Between the wall and the stream were found several large pieces of slag from the ancient ironworks which were carried on in the immediate neighbourhood, and a broken quern, or hand-mill, made of granite from Dartmoor; and lower down the stream, and hidden under its bank, lay a circular block of red sandstone, shaped like a truncated cone, and pierced with a square opening,

\* A paper read at the meeting of the Somersetshire Archaeological Society, by Mr. C. I. Elton, F.S.A.

which is said to resemble the stones used at the present day in Brittany for the manufacture of cider.

It is not easy, after the lapse of so many centuries, to realise the daily life of the Romans who farmed in our western valleys and hunted the wild boar and wolf through the oak forests of the Blackdown Hills. To bring the picture more vividly before the mind, I have found it useful to study the letters of Sidonius, the famous bishop of Auvergne, who was born soon after the Romans retired from Britain, and who lived to see the final triumph of the barbarian kings in Gaul. The description of his little country-house, built in a nook of the hills by the side of a mountain stream, has been of the greatest assistance to us in our exploration of the ruins of the villa at Whitestaunton. His house faced to the south and extended from a steep bank at the eastern end to a place where the stream fell into a broad lake on the other side of the garden. The trees on the bank overhung the roof of the baths, rising in tiled ridges to a central cone of metal. He describes the furnace-room with its intricate arrangement of lead pipes carried through the walls of the rooms for the warm baths and the vapour bath, the latter being fitted, as in our own example, with a paved semicircular recess containing the bather's bench. By the side of these rooms stretched a large hall, containing the plunge-bath, built square so as to allow plenty of room for the servants. The walls, he says, were of plain white plaster, but the ceiling was ornamented with metal-work which the people passing outside could see through the high bow-windows. Three arched doorways led into an open courtyard towards the west, where a perpetual stream splashed into a great stone basin, out of six brazen spouts in the shape of lions' heads. An entrance at the further corner opened into the dwelling-house close by the ladies' dining-room, and the wool-room and store-closets divided from it by slight partitions. Standing in front of these rooms, one looked across the *atrium* round which ran a narrow cloister, opening into a wide verandah on the side of the lake, and at the opposite or south-western corner running into a deep recess, where the servants held a nightly parliament of gossip when the family went upstairs to bed. The hall-door and vestibule took the centre of the southern front, and on the right of the entrance was the winter sitting-room, leading into a long wainscoted morning-room, with windows looking on the lake. A flight of steps led into the verandah below, where the guests used to sit and watch the boat-races and the fishermen dragging in the seine or setting their night lines for the lake trout. On the other side was a little sitting-room devoted to the mid-day siesta; and this led into the cool north parlour, near the point where our circuit commenced. The bishop delights in the country sights and sounds, the nightingale in the bush, the swallow twittering in the eaves, the sheep scattered on the hill-side, and the boys in the hayfield with their songs and rustic flutes. On the lawn stood two spreading lime-trees, where Sidonius and his friends used to play at tennis until the boughs grew thick and caught the balls, and so he concluded that he had lost his tennis-court and must use the place as an arbour for reading and playing backgammon. The sketch of his house and daily life is interesting in a high degree, and I hope that these short extracts from his letters may be of some use to us in our endeavour to realise the life of a country gentleman during the Roman occupation of Britain.

## EDINBURGH IN THE EIGHTEENTH CENTURY.

WHEN we look back to the Middle Ages, says a correspondent of the *Scotsman*, a century seems but a span. Its history is often compressed within a few lines. But a century is a long time on which to look back in the history of a modern city. In one sense, the last century seems longer than any similar period. It has been fuller of events. Progress has been more rapid, and change has been more thorough-going. During the past two or three generations the pace of life has been enormously accelerated, and therefore more ground has been traversed. With the introduction of the railway and the telegraph, followed by the telephone and the electric light, all the conditions and methods of life have changed, not always for the better. With these changes, there have also come changes in the ideas and expectations of men regarding life as a whole, and regarding the manners and customs of which it is largely made up. It does not admit of doubt, for example, that the Edinburgh of the middle of the nineteenth century differs very much more from the Edinburgh of 1750 than the Edinburgh of 1750 differed from that of 1650, or even from that of 1550. One century is of exactly the same length as another in respect of time, but one may differ very greatly from another in respect of social change and material progress. It is hardly too much to say that, judged in this way, Edinburgh has traversed a greater distance during the last hundred years than during any four or five previous centuries.

That this is true of its physical dimensions is capable of easy demonstration. In 1750, the city of Edinburgh covered little more than the top and the sides of the ridge that slopes steeply down from the Castle to Holyrood House. It occupied an oblong or coffin-shaped area, measuring no more than one mile in length,

and from a quarter to a half mile in breadth. The whole area within the city walls, with the addition of the Canongate, did not extend to more than half a square mile. In 1850, the city covered an area of six and a half square miles. That is to say, within the century its area was multiplied thirteen-fold. Sufficiently exact data do not exist for making a comparison of the population at different periods—at least, before the beginning of the present century. We do know, however, that within the present century the population has increased more than three-fold. In 1801 it was 66,000, in 1871 it was 196,000, and in 1881 it was 228,000. The disproportion between the increase in area and the increase in population is striking. It is due, of course, to the large proportion of single or self-contained houses in the New Town and also in the suburbs.

Still more remarkable have been the changes on the face of the city—in its features as distinguished from its size—and also in its social life. Seldom, indeed, has there been such an opportunity as the case of Edinburgh affords for contrasting an ancient with a modern city, by placing them side by side within a period of a few years. The reason is, that the transition from the old to the new period in the history of the northern metropolis was made, not gradually, but by a sudden leap. All at once the city burst the bounds within which it had been pent up for centuries, and spread itself over the surrounding fields. It was like the letting out of water when the embankment of a great reservoir gives way. The breach is quickly enlarged by the outpouring stream, and the underlying plains are soon flooded. Down till 1760, or thereabout, Edinburgh was still an old-fashioned city, differing very little from the Edinburgh of the days of Queen Mary and John Knox. It may be said to have retained its Mediæval character for two centuries after the rest of the country and the other large towns in it had put on a modern dress.

For this state of matters there were two reasons. The one was that the royalty of the city was still confined within its ancient walls. The necessity for expansion had been felt; but it had been met by extending the town, not laterally, but perpendicularly. Hence the block of houses—

Piled deep and massy, close and high,

with which the old ridge is covered. Hence the tall tenements in the High Street and the Canongate, six and seven, and sometimes twelve and thirteen storeys high, which have led strangers to remark that the streets are built vertically one on another.

The second reason for the "cabined, cribbed, confined" character of the old city was the physical nature of its site. It covered a hill between two deep valleys, the one of which was impassable, while the other could not be crossed without great inconvenience. First the valley had to be descended through dark alleys and narrow lanes on the one side, and then a corresponding ascent had to be made on the other. It was this question of access, undoubtedly, that stood in the way of the enlargement of the city. When it was solved, as we shall presently see, the old city sprang into new life.

It is interesting to dwell on the aspects of the town as a Mediæval survival, retaining its old-world flavour in quite modern times. The town itself, indeed, did not differ so greatly from its present appearance as did its surroundings. The trough of the valley on the north side was filled by the Nor' Loch, which extended for half a mile from the West Kirk glebe to the Physick Gardens. The sloping fields on the other side of the loch were called Barefort's or Bearford's Parks, and were used for grazing purposes. Half way up the slope—on the line of Princes' Street—a straggling road, called the Lang Gait, ran from Moutrie's Hill to Drumsheugh Toll. Between the Lang Gait and the Water of Leith there was nothing but green fields and woods, some farm-houses, and a few country mansions. These were then rural, if not quite outlandish, regions. Gentlemen riding on horseback in the Lang Gait were sometimes stopped by highwaymen in broad day. On Wood's Farm—the site of Queen Street—there was excellent shooting of partridges and hares, while snipe and woodcock might be got by going over to the low-lying grounds around Canonmills Loch. In the east of this region was the little borough of Broughton, truly a deserted village. Leith was a distant seaport, between which and the capital a coach ran twice a day, occupying one hour in the journey each way.

On the south side of the city the vacancy was not so absolute. Three roads ran out into the country from the city gates, and along these rows of houses and cottages were built on both sides for a quarter of a mile. But the intervening spaces were occupied with farms and orchards and market gardens. Practically, therefore, the city was still confined within its narrow limits. There the rich and the poor, the learned and the unlearned, the fashionable and the vulgar, the merchant and the artisan, the lord of session and the hungry clerk, jostled one another in the courts and lanes and narrow streets of the Canongate and the Lawnmarket. In the tall tenements which reared their dusky heads to the sky, the artisans and the petty tradesmen occupied the lowest and the highest storeys, and between them the merchants and the lawyers were content to dwell.

The tenancy of an upper flat was even deemed a mark of gentility. Major Topham, who visited Edinburgh in 1774, tells a

good story of an Edinburgh merchant who, on going to London, selected rooms for himself in the top flat of a lodging-house. When his London friends remonstrated with him for living in such a place, he replied, "I ken very weel what gentility is, and when I have lived all my life in a sixth storey, I am not come to London to live on the ground."

The houses, however, were not all in flats. Many of them were handsome and elegantly-furnished self-contained dwellings. In the main thoroughfares and in the adjoining courts there were family mansions of the nobility, which were equally striking in their external architecture, and tasteful and solid in their internal decorations. Moray House, in the Canongate, is a fine specimen of an old baronial mansion. The houses of the Regent Morton, the Marquis of Tweeddale, Cardinal Beaton, the Earl of Leven, Archbishop Sharp, the Earl of Orkney, and other nobles and gentles testify to a former grandeur which contrasts strangely with the squalor which now surrounds and infests them. In many of these houses, now occupied by the poorest of the population, there are, or there were lately, ornamental ceilings, and mantle-pieces, and wainscottings, which seem so sadly out of place as to suggest only the precious jewel in the head of the toad.

THE LATE MR. C. N. TRIPP.

MR. C. N. TRIPP, F.R.I.B.A., who died lately at the early age of thirty-eight, was, says the *Gloucestershire Chronicle*, a pupil of Messrs. Medland & Son, of Gloucester, and whilst in their office he obtained the National Medallion for success in the art competition. He commenced independent practice about eleven years ago, and was the architect of many public and private buildings in and around the county of Gloucester. Amongst others may be mentioned the "Raikes" Memorial Church, Gloucester (St. Paul's), which he obtained in a public competition. A perspective drawing of this work, now approaching its completion, was exhibited in the Royal Academy in 1881. He was the architect for the restoration of the ancient church of Hinton, Hants, and additions to the rectory; the vicarage of All Saints' Church, Gloucester; the Board Schools, Cirencester; extensive works at Edgworth Manor, Cirencester, the residence of Mr. Francis James, and three lodges; corn and malt warehouses at Gloucester Docks; the Pier View Hotel, Sharpness; the premises for the Gloucester Club in Westgate Street, and, within the last few months their new premises at the Bell Hotel; the premises for the Gloucester Conservative Club, which are not yet completed; and many private dwellings. The deceased gentleman led an energetic life, and was deservedly popular, and he will be greatly regretted by all who knew him. His distinguished ability as a draughtsman was the more remarkable from the fact that he only had the full use of his left hand.

NEW LEGAL STANDARD WIRE-GAUGE.

THE following table has been issued by the Standards Department of the Board of Trade. It will be seen that it differs from the Birmingham, Lancashire, and Whitworth gauges, which have hitherto been adopted in this country :—

A ROMAN TURRET.

A PAPER was read by the Rev. Dr. Bruce at the last meeting of the Newcastle Society of Antiquaries, upon "An Exploratory Turret of the Roman Wall near Magna Caervoran." He said: Having heard last week that a mile-castle had been discovered on the wall in the vicinity of Greenhead, and that it was likely to be speedily removed, Dr. Hodgkin and I went last Friday to make inquiries respecting it. Captain Coulson of Blenkinsop Castle kindly met us at the Greenhead station and took measures for our being able comfortably to accomplish our mission. Instead of a mile-castle, as we had supposed, we found that it was an exploratory turret which had been exposed; this was to a certain extent an agreeable surprise, for although we have several mile-castles on the wall, in a tolerable state of preservation, we have but two turrets, and both of these have been but recently brought to light through the exertions of Mr. Clayton. It may be well here to quote Horsley's account of these turrets. He says: "The smaller turrets (in Latin, *turres*) have been more generally and entirely ruined than the *castella*; so that 'tis hard to find three of them anywhere together with certainty. The distance between two, where it was thought surest, was measured and found to be near fourteen chains or three hundred and eight yards. It therefore seems most probable that there have been four of these between every two *castella*, at equal distances from the *castella*, and one another; for thus five intervals will just amount to seven furlongs, the usual or mean distance between the *castella*. And this scheme answers with a good deal of exactness to the situation of all the turrets that have yet been discovered. These exploratory turrets, or watch-towers, seem to have been only about 4 yards square at the bottom. And by placing sentinels at each of these, who must be within call of one another, the communication quite along the wall might be kept up, without having recourse to the fiction of a sounding trumpet or pipes laid under ground, from one end of the wall to the other." The two turrets to which we have referred as having been recently exposed are situated, the one at East Brunton and the other on the Black Carts Farm near the Limestone Bank. Both are in an encouraging state of preservation. There are traces of another turret to the west of the station of Amboglanna (Birdoswald), but they are so slight that few explorers will notice them. This new turret stands on the top of the cliff which forms the western extremity of the great basaltic dyke over which the wall runs for about ten miles in the central part of its course. The cliff is about 100 feet above the plain to the north, and as it descends rapidly to the west a most extensive view is obtained to the north, the south, and the west. It must have formed a good look-out station. The north wall of the turret is standing eight courses of stones high, and measures 5 feet 9 inches. Its side walls are nearly as high, and they are 3 feet 2 inches thick. The width of the turret (inside measurement) 13 feet 6 inches. The south wall has not yet been cleared of the rubbish which has encumbered it for ages, so that its full dimensions could not be ascertained. During the course of excavation numerous bones of animals were, as usual, found, one of them being the lower jaw of a young boar. One or two specimens of embossed Samian ware were turned up together with fragments of a wine amphora and other species of pottery. In the southern face of the wall, near the turret, has been found an inscribed stone, which, however, is scarcely legible. The first line seems to read COH. III., the second line we could make nothing of, though we tried hard. I have already said that this turret, or stone sentry-box as we may call it, stands upon a basaltic cliff, the last in a westerly direction of the Nine Nicks of Thirlwall. The cliff is now being quarried, and largely supplies the towns and cities to the east and west of it with paving-stones. Should the quarrymen proceed right on, the turret will soon be undermined and disappear; already its north-west angle has fallen. It is probably not too much to suppose that upon a proper representation being made to them the lessees of the quarry will, out of regard to the interests of antiquarian science and respect to the labours of men whose arms have been nerveless these seventeen centuries and more, spare the turret, and direct their operations to other quarters. Our excellent secretary, Dr. Hodgkin, was thoughtful enough to bring some photographic plates to bear upon the building, which, if the wind was not too strong to render the operation successful, will enable our members to form an idea of the existing state of the building; but, under any circumstances, as soon as the south wall is excavated and the whole interior made clear, it will be well if our secretary, Mr. Blair, who serves us so diligently and so well, will bring his art as a draughtsman to bear upon it, and to give us a correct representation of it. A good engraving will be of value to a late posterity. Horsley observes that in his time it was hard to find two or three turrets anywhere together with certainty, and he also states, as we have seen, that they have been more generally and entirely ruined than the mile-castles. The wall and all its appurtenances was, in the dark ages, the prey of spoilers whenever stone was wanted; as the turrets projected from the wall, and, though very substantial, were less so than the mile-castles and the wall, and were the first to be removed. Horsley is generally very accurate in his statements and worthy of the utmost

reliance; still, it is desirable that we had the means of verifying his statement as to the distance between the turrets. I have reason to know that when Mr. Clayton discovered the turret on the Black Carts Farm, and cleared the wall for a considerable distance to the westward of it, he caused diligent search to be made for any traces of a turret, but without success. The impression made upon the minds of those of us who watched the proceedings was that the distance between the turrets was really greater than Horsley supposed. I would like much that diligent search should be made on the line of the wall to the east of the newly-discovered turret, to see if some trace of another cannot be found so as to set at rest the question to which I have referred.

### "OWEN JONES" PRIZES.

THE Council of the Society of Arts have awarded the prizes which, as trustees of the sum of 400*l.* presented to them by the Owen Jones Memorial Committee, they offer for designs for household furniture, carpets, wall-papers, hangings, damasks, chintzes, &c., regulated by the principles laid down by Owen Jones. Each prize consists of a copy of "The Principles of Design" and a bronze medal. The following are the successful candidates for 1883: Wm. H. Woodall, West London, design for tiles; Thomas Barrett, Macclesfield, design for silk hangings; James Fletcher, Glasgow, designs for carpets; J. G. Jeffrey, Coalbrookdale, design for an Italian majolica drug-pot; Thomas J. Donohoe, Macclesfield, design for an embroidered silk cover; Constantine Procopides, Manchester, design for surface printing.

### AN AUSTRALIAN BUILDING CASE.

A CURIOUS case has been heard in the Supreme Court of Melbourne by Mr. Justice Williams. The plaintiff, Mr. John Bailey, a contractor, sued the defendant, Mr. Alfred D. Hart, for false imprisonment. Bailey had entered into a contract with Hart to erect for him some houses at South Yarra. Disputes occurred as to the delay in completing the contract, and as to the quality of the materials supplied. The architect cancelled the contract, but the plaintiff remained on the works. He refused to leave when requested to do so by the defendant, and he was then given into custody for wilful trespass. He was taken to the city watch-house, but was immediately released on his own bail, and next day the charge against him was dismissed. The contract made certain provisions for its determination by the architect on certain contingencies, and also for reference to arbitration of any matters in dispute. The dispute as to the contract was referred to two arbitrators, who, not being able to agree, appointed an umpire. Their decision was that the plaintiff should pay the defendant a sum of about 260*l.* and costs, and the question as to the legality of this award is still pending. The plaintiff brought an action against the defendant to recover damages for false imprisonment, and the jury, after hearing the evidence, gave a verdict for the plaintiff for 1,000*l.* Defendant applied for a new trial on the grounds of the improper reception of evidence, of there having been misdirection, and of the damages being excessive. The lately overruled the objections as to the reception of evidence and as to misdirection. But it was suggested to the parties that they might agree as to the damages, and, with the view of their arriving at a settlement, the formal decision was postponed. The parties would not agree to terms, and Mr. Justice Williams therefore gave the final judgment of the court.

His Honour said that the court had already delivered judgment on all the grounds for a new trial except on that of the damages being excessive. That had been left open with the hope that counsel on both sides would have adjusted the matter. They had, however, been unable to agree, and it therefore became necessary for the court to give judgment. There was no doubt that this being an action of tort, it was a difficult question for the court to deal with. It was generally a question for the jury what damages should be given, but if the jury were influenced by improper motives, there was no doubt that the court could interfere and rectify the verdict of the jury. In this case it was perfectly clear that the jury had not been influenced by any improper motives, but the damages were so large that the court might infer that the jury had made some mistake in assessing them. In *Lambkin v. The South Eastern Railway Company of Canada*, 5 Appeal Cases 352, there was an appeal from the Court of Queen's Bench in Canada directing a new trial. But it was stated by the Privy Council that where it appeared that some mistake must have been made, a new trial would be granted. In the present case the damages given were so large as to lead to the inference that some mistake was made. The imprisonment was of very short duration, and it was clear that the defendant was not influenced by any personal malice against the plaintiff, nor did the plaintiff allege in his declaration or prove by his evidence that he suffered any special damage. The damages appeared to be out of all proportion to the merits of the case. However, there was no doubt that the arrest of the plaintiff was altogether unnecessary, and that it

would have been more advisable to proceed against him by summons. The court, however, was now driven to the necessity of forming some estimate as to what damages should be given to the plaintiff. In estimating this amount, of course, they should go on the principle of allowing the jury great latitude as to damages in an action of tort, where there was no measure of damage. He personally thought the amount fixed by the court large, but acting on the principle he had referred to, if the jury had awarded that sum as damages it was difficult to see how it could have been disturbed. The court had decided to direct a new trial unless the plaintiff agreed to reduce the damages to 400*l.* If he consented, the rule for a new trial would be discharged without costs; if he did not consent, the rule would be made absolute, with costs, for a new trial, each party to pay his own costs of the first trial.

### CHURCH BUILDING AND RESTORATION.

**Manchester.**—On Saturday the Hon. Miss Egerton laid the foundation-stone of the new church of St. Mark, Newton Heath. The church, which has been designed in the Early English style, and will seat over 500, comprises nave, 70 feet by 30 feet, with narrow aisles used simply as passages; chancel, 33 feet long by 23 feet wide, with apsidal end; north and south transepts, clergy and choir vestries, and organ chamber at the north-east corner. The baptistery is an octagonal extension at the west end, in combination with the two main entrances. There is a third porch at the south-east end. The church is lighted by a large window at the west end, over baptistery arch; in chancel, by five two-light tracery windows, and an extra window near the ceiling, to throw light on to the pulpit. The aisles have four double windows on each side and the transepts, besides the north and south windows, which are somewhat similar to those last named, have in the gables four large circular tracery windows. Externally the church has one wide roof, spanning both nave and aisles, and continued on in one line to apsidal termination, broken only by an oak bell cot placed over the chancel arch. The transepts have their roofs running parallel with the nave, and at the west end the lean-to roofs of the porches, with the octagonal baptistery between, break the great height of the main gable. By keeping the nave and aisles under one roof, a much higher nave arcade than usual is obtained. This is in six bays, the piers of which are of stock brickwork, with the splays carried round arches. The materials used are bricks, white ends inside and out, with stock and terracotta dressings, from Mr. Jabez Thompson, of Northwich, and blue slates, principals and other timber work in red deal. The foundations have been already put in by Mr. Robert Carlyle, at a cost of 416*l.*; this sum was considerably over the contract, owing to the great extra depth it was necessary to go in order to obtain a solid bed. The contract for the superstructure, excluding the seating, has been let to Messrs. Cordingley & Stopford for 2,776*l.* Messrs. Tate & Popplewell, of Manchester, are the architects.

**Edale.**—It is intended to build a new church in the pretty little valley of Edale, Derbyshire, to replace the existing structure, which is a square, barnlike building, totally out of character and quite out of place in the midst of the beautiful scenery that surrounds it. The design for the new church has been prepared by Mr. William Dawes, architect, of Manchester. It is picturesque in outline, and will form a pretty feature among the hills that overlook the small village of Grindsbrook.

**Brighton.**—The committee of Queen's Square Church, North Street, Brighton, viewing the serious condition of the stonework of which the fabric is constructed, have called in the services of Mr. Arthur Loader, architect, of Brighton, and that gentleman has prepared specifications and plans for entirely removing the Caen stone casing, windows, &c., and re-executing the work in picked Corsham Down stone, at an estimated cost of a little over 2,000*l.*, and the work is to be proceeded with forthwith. A bazaar on a grand scale, to assist the fund for the object, will shortly be held in the Royal Pavilion.

**Llanglydwen.**—Llanglydwen Church, Pembrokeshire, was reopened by the Lord Bishop of the diocese on the 24th ult. The fabric consists of the nave, 36½ feet long by 17½ feet wide; chancel, 18 feet long by 13½ feet wide; to which have now been added a porch and vestry on the south side, the former measuring 5½ feet square, and the latter 11 feet by 8 feet. The ground has been lowered in places round the building, thus developing its proportions, and at the same time rendering the walls drier, and enabling sufficient ventilation to be provided. New windows of Douling stone frames and tracery have been inserted, two single lights in each of the north and south nave walls and two-light ones in the west and east ends, the latter being filled with stained glass by Clayton & Bell. Red terra-cotta crosses, manufactured by Doel, of Bridgend, have been placed on the eastern gables of nave and chancel, and a stone one on the western bell gable, which otherwise has not been altered. The western entrance has been blocked up, its flight of internal steps removed, and the new Douling stone arched doorway provided within the south porch with outer and inner doors of pitch pine, fitted with wrought iron.

work from Messrs. Brawn's Birmingham Art Metal Works. The whole of the open seats, chancel stalls, communion-table, altar rails, pulpit, and lectern are in varnished pitch pine, from the architect's special designs, Messrs. Brawn supplying the wrought-iron altar standards. Wooden platforms are placed under the seats, the best of the old slate pavement being laid down the centre of the passages, and bordered with an encaustic tile zig-zag, provided by Messrs. Webb, of Worcester, who also supplied the tile floor in the porch, chancel, and sacristy. The old Norman font-bowl and stem have been carefully cleaned and set on a new base. The walls throughout have been plastered internally, and the nave roof-timbers very much improved in character and design. The chancel arch and its roof woodwork have not been altered, but it is hoped that funds may be found to improve these some day. The fireplace that used to be in the Dol-wylim high-backed pew has, like the pew itself, of course been cleared away. None of the walls are the ancient ones, in fact there is nothing old but the font and a monumental cross in the churchyard. The builders were Messrs. Evans & Blethyn, of Penclipin; and the architect Mr. E. H. Lingen Barker, of London, Hereford, and Tenby.

### NEW BUILDINGS.

**Birmingham.**—In connection with the covering over of the Smithfield Market and the widening of St. Martin's Lane, a large block of buildings has been erected in the latter thoroughfare, extending from Jamaica Row to Moat Lane, so as to form a suitable front to the vegetable market. The buildings, which are from the designs of Messrs. Osborn & Reading, architects, Bennett's Hill, are designed in the style of the English Renaissance of the Stuart period, and are constructed of red brick with red terra-cotta dressings. At each end of the St. Martin's Lane front are circular turrets, with conical roofs, flanked by ornamental gables, and in the centre is a gable with octagonal turret on each side. The main entrance to the markets is in the centre of the St. Martin's Lane front, and consists of a central roadway for carts and waggons, 15 feet wide and 24 feet high, together with a wide entrance on either side for foot passengers. The main piers supporting the large archway are of stone, but the arch itself is constructed of terra-cotta, richly moulded and carved. Over the archway will be two sculptured figures in red terra-cotta, representing *Flora* and *Pomona*. The whole of the carving and sculptured work has been executed by Mr. John Roddis. The archways are fitted with massive wrought-iron gates, manufactured by Messrs. Hart, Son, Peard & Co. The Jamaica Row front and about one-third of the St. Martin's Lane front are occupied by the new Woolpack Hotel, which will stand as nearly as possible upon the same site as the old Woolpack. The hotel is entered from St. Martin's Lane by a wide hall, having a staircase which leads to the upper floors. On the left of the entrance there is a commodious smoking-room, and on the right a large bar, 18 feet wide by 36 feet long, with an entrance at the Jamaica Row corner of the building. The other end of the Jamaica Row front is wholly occupied by a large luncheon and dining-room, the dimensions of which are 39 feet by 23 feet, and in which there will be a bar extending the length of the room. On the basement, also, there is a large luncheon bar, and a grill-room, 39 feet in length by 34 feet 6 inches in breadth, entered by a staircase leading down from the doorway at the extreme end of the Jamaica Row front. On the first floor, and fronting to Jamaica Row, there is a dining-room, measuring 24 feet by 43 feet, with serving-room and lifts. The remainder of the first floor is occupied by a coffee-room, 28 feet 6 inches long by 18 feet 3 inches wide, and a commercial-room, both fronting into St. Martin's Lane. The kitchens, larders, &c., of the hotel are on the fourth or uppermost floor, and are spacious and lofty. On the remaining floors there are bed and sitting-rooms, thirty-six in number; bath-rooms, and other conveniences. On the left of the large entrance to the markets has been placed the market superintendent's office, which has a staircase communicating with his house, on a portion of the first and second floors. The remaining portion of the St. Martin's Lane front is occupied by large shops, with show-rooms on the first floor, and well-lighted basements extending underneath the footpath. The various lettings in the building are all divided by fireproof floors and walls, and the floors of the kitchens are constructed of fireproof materials. The contractor is Mr. Frederick J. Briley, of Coventry Road, Small Heath.

### ENGINEERING WORKS.

**Bangor Waterworks.**—The works for the water supply of Bangor, co. Down, have been commenced. The reservoirs will provide storage for 24,000,000 gallons of water, equal to 240 days' supply for 5,000 inhabitants, at 20 gallons per day for each. The pipes will be laid along the county road to the town, for a distance of about two miles. Mr. W. H. Campbell has taken the contract for the works, which have been planned by Mr. Henry Chappell, C.E.

### GENERAL.

**Mr. D. Birkett, F.R.I.B.A.**, delivered a lecture, in Carlisle, upon architecture on Wednesday last.

**A Design by Messrs. Matthews & Mackenzie, of Aberdeen**, was awarded the first prize in the competition for the Elgin town hall.

**A New Theatre** is about to be erected in Warrington from the designs of Messrs. Pierpoint & Adams.

**Mr. W. Lister Newcombe, F.R.I.B.A.**, has prepared designs for the new Eye Infirmary, which is to be erected in St. Mary's Place, Newcastle-on-Tyne.

**Stable Buildings**, on an extensive scale, are to be erected at Monkwearmouth by the North-Eastern Railway Company.

**Mr. Joseph Hamblett, of West Bromwich**, has been awarded a diploma of honour and gold medal at the Amsterdam Exhibition for his terra metallic blue bricks, copings, ridges, &c.

**Mr. H. T. Gradon, of Durham**, having been successful in the competition, has received instructions to prepare plans and specifications for the cemetery chapel, lodge, and gates at Southwick. There were eighteen competitors.

**A Court-house** has been erected at Church, Lancashire, for the divisions of Church, Oswaldtwistle, and Clayton-le-Moors. The cost of the building has been over 6,000*l*. Messrs. Waddington & Son, of Burnley and Manchester, are the architects.

**The Chapel of Wittenberg Castle**, which is associated with the early history of the Reformation, is now being restored. Slender octagonal pillars will be introduced to support the interior. The graves of Frederick the Wise and John of Saxony will remain where they are, but many of the monuments will have to be transferred to the walls of the choir. The free niches will be filled with statues of the contemporaries of the two great reformers. The roofs and windows will be coloured, the altar, seats, chancel, and organ will be restored in carved oak, and the round tower at the west front will be raised.

**Professor Valentine Ball** has been appointed Director of the Museum of Science and Art in Dublin.

**An Electric Tramway** is about to be constructed between Newry and Bessbrook, a distance of seven miles.

**A New Station** is in course of erection at Brighton from the designs of Mr. H. E. Wallis. The roof, which has an area of about 100,000 square feet, is glazed on the Helliwell system.

**Baths and Washhouses** are to be erected in Shoe Lane, Dublin, from plans by the city architect. Messrs. Dudgeon Bros. are the quantity surveyors.

**M. Chevreul**, the chemist, who has in a book on colour and in other publications shown the relation between art and science, celebrated his ninety-eighth birthday on August 31.

**From a Parliamentary Return** just issued, it appears that the total amount of house duty charged on houses in the metropolis in the year ending April 5 last was 797,891*l*. The parishes which were assessed most heavily were: Kensington, 68,219*l*; St. George, Hanover Square, 60,975*l*; St. Mary, Islington, 54,015*l*; St. Marylebone, 49,163*l*; Paddington, 47,219*l*; St. Pancras, 44,950*l*; St. Mary, Lambeth, 43,856*l*; St. Giles, Camberwell (including Peckham and Dulwich), 30,229*l*; St. John, Hackney, 28,909*l*; and St. James, Westminster (including the Verge of the Palaces), 23,719*l*.

**The Liverpool Autumn Exhibition** of works by modern artists was opened to the public on Monday at the Walker Art Gallery. There are, including 39 pieces of sculpture, 1,636 works on view, as compared with 1,589 last year. These have been selected by the hanging committee from 3,585 works.

**Messrs. T. & R. Boote** have supplied the interior and exterior tiling for the new coffee palace in Corporation Street, Birmingham. The tiling of the arches in the basement is unique in character, and the whole work redounds much to the credit of the Waterloo Potteries.

**Mr. George Woodhouse**, architect, of Bolton, died on the 3rd inst. He was one of the architects of the town hall, and enjoyed a large practice in Lancashire.

**The Restoration** of the Saxon Tower at Earls Barton has been commenced.

**A Contract** has been let for constructing the foundations for the colossal statue of *Liberty* at New York. The price to be paid for the concrete is 3 dols. 37 cents per cubic yard.

**The Newcastle City Council** have resolved to appoint a committee to confer with the River Tyne Commissioners, for the purpose of ascertaining the feasibility of constructing a ship canal connecting Newcastle and district with the Solway Firth. It was stated that such a canal would be of great commercial advantage to the Tyne. The committee will report the result of their inquiry at a future meeting.

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, SEPTEMBER 8, 1883.

### TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C.; not later than 3 p.m. on Thursdays.*

*\*\* Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—  
"Contract Supplement to THE ARCHITECT."*

### EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

### TO AMERICAN SUBSCRIBERS.

*All subscriptions are payable one year in advance, and may commence at any date.*

*The cost of one year's subscription, mailed free, is 20s. sterling per annum, and Post Office Orders for that amount can be obtained at any Post Office in the United States.*

*Post Office Orders should be made payable at Lombard Street Post Office, London, but SHOULD BE ADDRESSED TO GILBERT WOOD, 175 Strand, W.C., London, England.*

*In order to meet the difficulty which constantly arises from subscribers in the United States omitting to advise the Publishing Office at the time they remit a Post Office Order for the amount of their Subscriptions, and also as a reply to frequent inquiries as to the best means of obtaining THE ARCHITECT in America, the Publisher desires to offer the following suggestions:—*

*To prevent the possibility of delay, and to enable the Post Office Order to be the more readily traced in the event of its miscarriage in transit, it is advisable in all cases to notify per following mail, the number, date, and location of the order.*

### APPOINTMENTS VACANT.

**HINCKLEY.**—Sept. 12.—Applications are required by the Local Board for the Appointment of a Surveyor. Salary not exceeding 125*l.* per annum. Mr. Thomas Moss, Clerk to the Local Board, Castle Street, Hinckley.

**STEYNING.**—Sept. 18.—Applications are required by the Rural Sanitary Authority for the Appointment of a Surveyor. Salary 120*l.* per annum. Mr. E. Cripps, Clerk, Board Room, New Shoreham.

### COMPETITIONS OPEN.

# The Architect.

## VERY TALL BUILDING.

NE of the earliest efforts in bricks and mortar was an edifice, as we are told, intended to place its builders on a level with the authorities of the upper air, with whom they found themselves not able to cope at the level of the ground. It was a failure; and those who in after times desired to rise superior to ordinary earthly conditions were contented themselves

with ascending to the "high places" which mountain tops had provided for them by natural means. But throughout all ages it has been a chronic ambition in the human mind, quite apart from any wish to invade the dominions of superterranean powers, to build something very tall. There are legends in many lands of Somebody's "Folly," the ruins of which remain as a warning to posterity to count the cost beforehand in more ways than one. Perhaps the most piquant of such traditions among ourselves is that of BECKFORD'S tower at Fonthill, and its sudden disappearance (he had been his own architect), as complete in its way as that of the campanile mentioned by ALBERTI, the total subsidence of which into Venetian soil provoked him to lay down the cautious rule always to dig your well before you lay your foundation. In still more modern times we have, amongst the rest, Mr. HANKEY'S edifice by St. James's Park, of which we will say nothing but that it is of the same class of enterprise—no doubt inspired from the same source—as the very tall buildings we have now to speak of.

The city of New York, as all the world knows, stands on a long narrow promontory (or island) between two sea-reaches, and in fact occupies now the whole of it where half a century ago it covered only the seaward end or point. This point, as might be supposed, like the corresponding portion of London which we call "the City," still continues to be the central seat of commercial business; and, as is fortunately not the case in London, it is on account of its configuration incapable of extension by the process of expanding into surrounding neighbourhoods. In other words, the commercial quarter can only expand in one direction; and it may at once be said that this disadvantage has for some time past exercised the local mind very seriously.

Now in London we have adopted two modes of dealing with the "City"—or rather three, if we include the direct enlargement of the radius. In the first place, we have been covering every available foot of ground formerly open, and secondly, we have been increasing the height of our buildings. Speaking roundly, the ramshackle loose-jointed old "City," of seldom more than two storeys high, has given place to a well-shaken-together new "City," averaging four storeys together with a basement which is as good as another. Few people, we believe, are at all aware of the enormous augmentation of business "floor-space" which has been accomplished within the limits of acre by acre in this way; and we need scarcely add that all the while the value of yard by yard of the floor-space itself has been equally augmenting, so that the advance in the total rental value of the "City" during the last thirty years has come to be one of the wonders—although there are several more of the same sort—of modern civilisation.

What, then, could be done with New York? What has been done, in the ordinary way, is of course the same gradual consolidation of the building property and the same increase of the height of houses; but that these processes have not met the advancing requirements of the commercial community will not surprise anybody who has even a very moderate acquaintance with American affairs. In a word, the New York building owners have considered themselves forced into an increase of altitude which not only is astonishing, and to many of our readers may seem almost incredible, but is becoming alarming.

The plan adopted is to obtain a suitable site and build upon it, for division into suites of offices, an edifice gigantic in all three dimensions; for what will some of our RIF VAN WINKLES of humdrum speculation-building in England say to

such a structure about 100 feet square and 150 feet high, divided into 300 suites of rooms distributed in ten storeys, and having for ascent and descent two or three pairs of "elevators" or lifts performing regular journeys up and down every few minutes?

As matter of fact, buildings of this remarkable kind have been erected in New York during the last eight or nine years, not in one or two cases only, but in such a number and with such satisfaction to owners and occupiers that some of the more thoughtful classes of the citizens are becoming apprehensive lest the spirit of enterprise should go a little too far in such an extraordinary direction. The first of these buildings was erected by the proprietors of the well-known *Tribune* journal in 1874; and it started the race with no half measures. The height was at once made 155 feet to the roof, the number of storeys above ground ten, and the thickness of the walls at the base over 5 feet. The cost, we may add, was nearly a million of dollars, besides another half a million for the site. There quickly followed a similar building for one of the Telegraph Companies, and one for the *Evening Post* newspaper; then "Temple Court" for law offices; then the "Morse Building," the "Mills Building" by the Stock Exchange, the "United Bank Building," and so on; to be followed so far as appearances now go, by many more, until whole rows of these enormous houses 150 feet high—so the timid say—shall before long convert the streets into narrow gorges, as inaccessible to the light and air of heaven as they must be concentrative of the increasing noise and dirt of incessant money-spinning.

This strange phenomenon of building, however, is not to be regarded as an eccentricity. It is quite plain that it is the deliberate outcome of urgent necessity and legitimate enterprise. The elevator and the telephone have done it all. When the crowding of business has reached a climax on the ground, the elevator offers without a moment's hesitation to take it up into the air, and the telephone is as ready to lend its aid in bridging over space at the higher level as at the lower. If stairs had to be ascended to tenth floors, and conversation had to be conducted face to face, the case would be different. But it occurs to us to ask, first, why the increase of height should stop at 150 feet; and, secondly, why the telephone by itself should not solve the problem in a way of its own, by carrying word of mouth simply over a larger area of the town? There is obviously no need to confine heights to the present limit, either because of the narrow resources of construction or on account of the feeble powers of the lift. At the same time, with all its boasted efficiency, it must be admitted that the telephone cannot submit a sample of goods, or sign a contract, or evade a quarrel by the charm of a smile, or shake hands and join in a slight refection over the settlement of a difficulty.

But we cannot help expressing a hope that this too tall style of building may not take root in London. One would not like to see the Royal Exchange with six extra storeys added, or two rows of "monster" houses 150 feet high running along the Poultry. Amongst Londoners there are so many who object to telephones and lifts on personal grounds, and even to the increase of the pace of business for similar reasons, that the present generation at any rate may perhaps so far feel secure against the imitation of New York. But nevertheless, if commercial activity at headquarters is to go on as it has been going, it would be hazardous indeed to prognosticate what may happen in another twenty years.

The economical question with the owners of house property in the City of London and other similar centres of business is at present easily stated. Take a good house of business offices at its present extreme height of four storeys above ground, what is the value of the roof area by way of a ground rent? According to existing arrangements it is worth nothing. That is to say the rent to be obtained for a fifth storey would be so small, and so precarious besides, that it would not pay for the extra cost of building. But if any one were to think of taking up the strict line of American speculation, the case would stand somewhat differently. He would require to start with a sufficiently large area of ground. The cost of lifts and the space they would occupy might be easily dealt with, even if a staircase were also formed as a concession to prejudice (there are no prejudices in America). But the additional substantiality of walls, and the loss of space thereby arising, might be a more serious item. The ground rent value at the high level would of course be estimated after consider-

ing all this ; and it would still depend upon how far (to speak plainly) men of business would consent as a rule to commit themselves to the lift ; for they certainly would not ascend the stair. For the present we are of opinion that an exhaustive calculation of value would not bring out a profit, and if not, it plainly follows that the ground rent value is nil. If, on the contrary, a profit were found to appear, as estimated for one extra storey only, it may perhaps be said—conceding the use of the lift as an essential condition—that the greater the number of extra storeys the greater the profit would be. If so, this is the explanation why the Americans commenced *per saltum* with ten storey buildings ; once we enter the lift it makes little difference where we get out of it. But there are other considerations, more peculiar to London, which we cannot at present proceed to discuss.

## THE BRUSSELS ARCHITECTURAL EXHIBITION.—II.

CORRESPONDING with the revival of the Elizabethan and Queen Anne styles in England, there has been in Belgium quite a “Renaissance” of the Flemish style of the sixteenth century. Some architects, however, object that, whereas the Tudor style has been improved to suit modern ideas of comfort, the old Flemish buildings are reproduced with but slight modification, with their old nailed doors and vastitas (Germ. *Was ist das?*), and windows with small and partially opaque panes that do not afford sufficient light. However that may be, there are some very effective drawings of neo-Flemish edifices in the exhibition. We have said that the modern section is subdivided into thirteen classes, while the designs sent in for competition form the fourteenth.

The first class is devoted to ecclesiastical architecture, and is opened by the president of the Société Centrale d'Architecture, M. J. BAES, with a *relevé*, that is to say, a drawing from the existing structure, of the Temple des Augustins, Brussels, with design for a presbytery. This is followed by the drawings of three new churches, designed by M. BACKELMANS, a Prix de Rome\* of great promise, who died very young. That dedicated to St. ARMAND AU STUYVENBERG, at Antwerp, is in the Transition style of the thirteenth century, with French treatment, a style which is much in fashion in Belgium at the present time. The chief peculiarity of this church is that the arrangement of the columns permits of all the chapels being seen from any point in the nave. M. L. BLOMME, architect to the province of Antwerp, contributes his drawings of the church at Berlaer in thirteenth-century Gothic, with a treatment which is rather English than French. M. E. CARPENTIER, whose studies in England give a decided *cachet* to his compositions, comes next, with the drawings of two churches already erected, and both the preliminary and the definite design for the reconstruction of Spa parish church, a very fine work now in course of execution. A photograph is also shown of the church of Nôtre Dame, at Huy, as it existed a short time ago, and the same view of the church as now in course of restoration, in the Perpendicular style of the thirteenth century, with almost German treatment. A design for the completion of the royal church at Laeken, near Brussels, by M. L. DE CURTE is interesting. The drawings of the Jewish synagogue in the style of the twelfth century, erected in the Rue de la Régence, Brussels, are exhibited by the architect, M. DE KEYSER. Quite a moonlight effect is produced by the blue Mons stone in the design, by M. V. DUMORTIER, for the restoration of the collegiate church of Sainte-Waudru, at Mons, the chief town of Hainault. The diagram plan is treated most artistically, being placed in one corner with no border line round it—nothing but the black lines with the sky as a ground tint. Another design for the restoration of the same church in the florid Gothic style of the fifteenth century is, however, more interesting. M. CHARLES LICOT, who took the gold medal at the Brussels triennial exhibition of last year, contributes a series of carefully elaborated drawings of the ruined Abbaye de Villers, erected at the beginning of the thirteenth century in the Transition style from Norman to Early Gothic, with design for its appropriate restoration. M. F. SCHOY has sent very effective copies on tracing cloth of drawings of the

church of Nôtre Dame du Sablon, Brussels, with design for its restoration, which gained a gold medal at the present Amsterdam Exhibition. This historical church, which adjoins the Rue de la Régence, is in a deplorable state of dilapidation ; and a sacristy of comparatively modern addition projects beyond the new line of frontage, so as to obstruct the view of the new Palais de Justice from the Place Royale. The church is to be restored, and the sacristy removed as soon as means permit.

The second class embraces civil architecture, with a very wide range of subjects. A striking design is that of the monumental bridge, by M. J. BAES, president of the society, which gained the prize of the Belgian Academy in 1870, and the gold medal at the Brussels Salon in 1878. M. DE LA CENSERIE (Prix de Rome) has sent a design for the restoration of the guard-house at Bruges. This building contains the celebrated chimney-piece of the Franc de Bruges, one of the finest bits of sixteenth-century sculpture in the whole of Belgium. M. COENRAETS and M. DE VESTEL both send designs for the monumental mouth of a tunnel under the Alps ; if the former possesses the greater merit, the latter is the more imposing of the two. Very interesting, now that the edifice is fast approaching completion, are the drawings of the colossal Palace of Justice, Brussels, designed by M. J. POELLAERT, who died in 1879. The public are now excluded from the works, as the building is to be inaugurated on October 15 next, and great activity prevails. Plans and photographs of the beautiful Antwerp Bourse, in the development of the fifteenth-century style peculiar to that city, and with each column of different design, are shown by its architect, M. J. SCHADDE, together with drawings of the Bruges station—finished this year, and against which the reproach has been cast that it is more like a convent than a railway station. In the decoration of the interior, the various modes of travelling are depicted—the sledge, the sedan-chair, the ox-cart, and the diligence—as contrasting with the steamboat and the locomotive. In 1881 the communal administration of Schaerbeck, a suburb of Brussels, opened a competition for a *maison communal*—which answers to *hôtel de ville* in a city—and three of the designs submitted are exhibited. That by M. VAN RYSELBERGHE, brother of the scientist at the Observatory, whose inventions in telegraphy and telephony are now exciting so much interest, is in the Norman Gothic of the thirteenth century, treated in English fashion, and is finely drawn. That by M. DUMORTIER, a member of the council, is bold and striking ; while that by M. BISSCHOPS is effectively drawn in black and white. A design by M. L. JACQUES, of a *maison communale* for a town of 50,000 inhabitants, is in the Flemish style of the sixteenth century ; and these two last-named compositions give a good idea of the style now in vogue in Belgium.

In the third class, scholastic architecture, the Municipality of Antwerp (M. P. DENS, architect) have sent drawings of all their schools, from the free communal school to the Athenæum ; and this series forms a very complete collection of such erections. M. J. J. BENOIT, who is superintending the erection of the new Palais de Justice, under the Inspector-General of Ponts et Chaussées, M. WELLENS, contributes his design, now executed, of the drawing school and girls' middle-class school at Molenbeek Saint-Jean, boldly treated in the neo-Greek style. In this class are exhibited the drawings, by the late J. P. CLUYSENSAER, M.R.I.B.A.—a friend of DONALDSON and FERGUSON—of the Brussels Conservatoire de Musique, in the LOUIS XIII. style, which forms an effective addition to the Rue de la Régence. M. DE COSTER, of Antwerp, Prix de Rome, sends his design for a college of music and elocution for 500 pupils, which gained the prize at the architectural competition of 1875. M. DE LA CENSERIE, Bruges, and M. DIETENS, Antwerp, both Prix de Rome, send designs, one for an athênæum, and the other for a university. All the plans of the Normal College for infant school teachers at Mons, a building which is very complete and justly admired, are exhibited by the architect, M. J. HUBERT.

In the class (fourth) of hospital architecture, MM. L. & H. BLOMME, of Antwerp, show a decidedly English tendency in their design for an orphan girls' school ; while their orphan boys' school, erected at Antwerp in the Flemish style of the sixteenth century, is one of the finest erections of this kind. Each city of Belgium has preserved its individual style of architecture. That of Bruges is fifteenth-century Gothic with stepped gables and dormers, generally cut by three or four arcades rising the whole height of the building, and connected

\* Every three years the Belgian Government offers a prize of 5,000 frs. (200*l.*) a year for four years, to enable the successful candidate to study in Greece and Italy.

by a moulding which forms a general frame to the façade. This individuality is well carried out by M. L. DE LA CENSERIE in his design for a hospital, entirely of brick, in the style of the fourteenth and fifteenth centuries, the same that he adopted for the Normal School which he erected at Bruges. An interesting exhibit is the collection of drawings made from the Biloque Hospital, Ghent (thirteenth century), by M. E. SERRURE, of St. Nicholas, in the Pays de Waes, a district of East Flanders.

Three exhibits merit special attention in class five, domestic town architecture. M. E. ACKER, a member of the council, sends drawings of the frontage of two houses, one at Bucharest, with decoration in graphite, a new process, giving the appearance of enamel and producing an ornamentation which resists the action of the weather. M. L. H. BLOMME contributes his remarkable drawings of the *Meijbloem Huis*, erected on the Place de Meir, Antwerp, in the Flemish style of the sixteenth century; and M. A. SAMYN puts in his design for the masonic lodge now erected in Brussels, a fine composition in the Egyptian style, with handsome decoration.

In class six, domestic suburban architecture, M. J. RAU exhibits his design for a country-house, which gained the first prize at a competition opened by the Central Society in 1881. M. J. SCHADDE, professor of architecture at the Royal Academy of Antwerp, and who has erected more Flemish châteaux than any other architect in Belgium, shows photographs of a fine building of the kind erected for Baron G. DE CONINCK, at Woumen, in West Flanders. M. VAN YSENDYCK puts in the plans, façades, and details of various constructions in neo-Flemish or the revived sixteenth-century Flemish style; and M. P. SAINTENOY, Brussels, some sketches of country-houses.

Under the head of class seven (industrial architecture) must be mentioned the design for a Cité Ouvrière, or workmen's colony, by M. H. CLOSSON, with an application of warming by steam, as well as a scheme for the warming of a block of dwelling-houses from a common source of heat.

In class eight (military architecture) the Minister of War sends drawings of the Antwerp Arsenal and various barracks designed by the late M. PAUWELS. The Porte d'Hérentals in the new Antwerp fortifications, designed by the same architect, is bold, but looks better as executed than it does on paper. In this class also appear the fine cavalry barracks, erected to face the new Champ des Manœuvres, near Brussels.

Class nine is devoted to funereal or commemorative architecture, and includes the monument in the Laeken cemetery to the late M. J. POELAERT, architect of the new Palais de Justice, by M. J. J. BENOIT. It is in the neo-Greek style, the same as that of the Palais de Justice, and contains a bust of the architect. M. H. BLOMME sends a project for a Campo Santo, treated in the severe style of the thirteenth century. M. P. SAINTENOY puts in his design for a commemorative monument that gained the first prize at the Ghent Exhibition of industrial art last year, and M. A. SCHOY his sketch of the monument to FLAMINIUS GARNIER (sixteenth-century Flemish) in the church of Notre Dame du Sablon, Brussels.

In class ten, of decorative architecture, M. J. BAES, the president of the society, enters his design for the decoration of the Assize Court of the new Palais de Justice, which has been carried out, and produces a grand effect. Some designs of cars for the Mechlin Cavalcade in 1875 by M. W. GEETS, director of the Mechlin Academy, are very fine; as also is that by M. A. F. SCHOY for the triumphal arch erected at the Porte de Schaerbeek, Brussels, during the fêtes of 1880. Careful drawing is evinced in the design for an archæologist's library, by M. P. SAINTENOY, that gained the first prize at the Ghent competition in 1882.

Class eleven is entitled "Travaux d'Édilité," and includes public places with the transformation of streets or quarters. Such a transformation of the streets between the upper and the lower towns of Brussels has been talked of any time during the memory of the oldest inhabitant, and probably long before. Many have been the plans proposed, and one more is added in the perspective view contributed by M. G. BORDIAU, architect of the Brussels National Exhibition of 1880. The drawings by the late J. P. CLUYSENAER, of the Passage St. Hubert, Brussels, built in 1846, are exhibited. This was then the largest and most splendid arcade in Europe, measuring 213 mètres long, 18 mètres high, and 8 mètres wide (699 feet by 59 feet by 26 feet), until the Victor Emanuel Gallery was erected at Milan after the same design.

Class twelve consists of drawings and restorations of foreign

monumental buildings, by Belgian architects, and includes a fine drawing of the Parthenon at Athens, both in its present state and with design for restoration, by M. DE LA CENSERIE, communal architect at Bruges. M. G. DEMAN contributes some well-executed fragments both from Rome and Pompeii.

Class thirteen contains sketches which cannot be included in the other classes. The most noticeable are water-colours by M. J. BAES, representing the quaint towers of several edifices in Holland, and a section in perspective of the Salle des Pas Perdus in the new Palais de Justice, with proposed decoration.

The conditions for the competition require that the designs be sent in anonymously, but be distinguished by a symbol or motto; and only the names of successful competitors will be known. The prizes offered are to the value of 1,000, 500, and 200 frs.; and an additional prize of 100 frs. may be added for merit of drawing, irrespective of architectural value. The style of the subject—"A High School of Architecture"—is left to competitors; but there must be ground-floor and first-floor plans, front and side elevations, a vertical section and details of exterior and interior. A perspective view or a short description may also be added. Although the subject is a school, it must have an artistic character befitting its destination. The school, intended to complete the art education of pupils who have already received elementary instruction in architecture, is to include: (1) four class-rooms for instruction in Classical and Mediæval architecture; (2) a class-room for mathematics, physics, and chemistry; a laboratory for the chemical professor; and another for thirty pupils, with special ventilation; (3) a class-room for lectures on construction, architecture, &c.; (4) two rooms for drawing from plaster casts and from nature; (5) one or more shops for manual work, such as joinery, carpentry, smithing, and modelling, which may be placed in the basement; (6) a permanent exhibition of models illustrating methods of construction; (7) a hall for exhibiting the works of pupils; (8) a large hall for réunions; (9) an architectural museum; (10) a library; (11) the director's residence; and (12) sixty cabinets for competitions in connection with a large ante-chamber.

Nine sets of drawings have been sent in, of which it may be said that No. 3, "Indispensable," is treated in a bold manner; that No. 4, "Alea jacta est," is good both in composition and in drawing; that No. 5, "Spero," is a good design, though the drawing is not so effective as some others; and that of No. 19, "Anath," the plan is far more meritorious than the façade. The judges consist of the members of committee, viz., MM. ACKER, BAES, BRUNFAUT, DUMORTIER, and NEUTE, to whom are added M. F. HOMPUS, delegate of the Antwerp Society of Architects; M. CHARLES SOUBRE, architect, Liège; and M. CHARLES VAN RYSELBERGHE, architect to the Ghent Municipality. The jury did not consider any design sufficiently meritorious to obtain the first prize; but they granted a second prize "with distinction" to M. OSCAR FRANCOTTE, and another to M. HUBRECHT. Third prizes are awarded to M. TULPINCK and M. MORIAL, while M. DE NEFF, M. VAN PETEGHEM and M. VAN ROELEN are consoled with honourable mentions.

The moving spirit and organiser of the competition and exhibition is M. CHARLES NEUTE, the secretary to the society; and the exhibition will close on the 30th inst. Last week we spoke favourably of the Great Eastern Company's Harwich route for Antwerp and Brussels, and incidentally named the new steamer *Norwich*. We have since made a trip in her, and find she does not belie her reputation. The elegance and convenience of her internal fittings are only equalled by her sea-going qualities. On September 1 this vessel left Harwich at 10 p.m., her usual hour for starting, while the captains of the Calais, Ostend and Flushing steamers refused to put to sea, and she reached Antwerp at a quarter to 11, only three-quarters of an hour after her usual time. So severe was the hurricane in Brussels that it tore up by the roots some of the younger trees in the boulevards.

**The Plans** for the erection of the new church on the West Cliff at Whitby have obtained all the necessary consents, including that of Sir George Elliot, Bart., M.P., who has instructed his solicitors to proceed with the conveyance of the site, and has expressed a hope that the tenders may be got ready and the foundation-stone laid at an early date. Mr. Johnson, of Newcastle-on-Tyne, the architect, is to visit Whitby shortly and advise as to inviting tenders for the execution of the work.

## CIRCULAR NOTES FROM FRANCONIA.—III.

[BY A CORRESPONDENT.]

THE name of Switzerland seems applied, through some lack of fit local appellation, to any district that abounds in crag, wood, and torrent. Belgium has at least one *petite Suisse* near Dinant, on the Meuse; "Saxon Switzerland," about the windings of the Elbe, is the pride of Eastern Germany; Switzerland's of diminutive scale crop up everywhere to provoke with misapplied epithet the tourist, who associates the word with snowy peaks, avalanches and glaciers, COLERIDGE'S "Hymn to Mont Blanc," and the adventures of the Alpine Club. Let no one, therefore, who makes a *détour* into Franconian Switzerland lose his temper for want of warning if he find the scenery of that pleasant region fall short in scale and character of the impressive associations of its name. Crag, woods, and streams he will see in plenty, but for peaks and passes must seek elsewhere.

Nürnberg has been left behind, and we drive cheerily along through meadow and harvest field streaked with patches of hop, through picturesque villages where the quaint little children are out enacting unconscious *Dorfgeschichten*, and under the shade of wayside trees to Birschfeld. A stretch of lovely pine-wood brings us out into the open again, to find the horizon of the high tableland we traverse is rising fast. We dash through the central square of Erlangen, without stopping to look at the university lodged in the old palace of the Margraves of Baireuth, and are glad soon after to lose sight of the railroad which has accompanied us thus far, as we come across the passage of the Ludwigs canal which connects the Danube and the Main, using at either end the waters of the Altmühl and the Regnitz. Wooded hills, red-tiled villages, and a glowing purple distance lie off the highway, which we leave beyond Bauersdorf, and turn aside by a sort of farm-road through the open fields and woods into the hills, along whose slopes the route will lead above the romantic and well-watered valleys to Muggendorf. This portion of the way is full of charm. Along the roads the unguarded fruit-trees hang out their clusters of cherries and apples; the cultivated land, without division, mingles corn, bearded barley, clover, vegetable crops and pasture in friendly neighbourhood; wains drawn by oxen, laden with the late hay harvest and the ripe corn, crawl slowly along; women are out at field work, their bright orange and scarlet kerchiefs, red bodices, and short dark blue gowns over the thick hosen making spots of brilliant colour. Here and there a village takes sun and shadow on its red roofs, deep-pointed gables and projecting dormers above the timbered upper storey; a Schloss, or more often a little chapel, makes a landmark on the summit of a hill. Along the road, or standing in the midst of the fields, the frequent crucifix, generally carved and coloured wood, and many stone crosses, show that the Franconian peasant clings to the pious ways of his fathers spite of the reformed doctrine. In this region the cemeteries for the village are often quite away from the houses, and the dead lie in a little walled-off enclosure amidst the friendly corn-fields, where the living labour in sight of their resting-place. At Pretsfeld a halt is made, and you can discuss coffee worthy of the best hotel in Europe outside a cross-way *Gasthaus*, and watch the women draw water for the brown cows and oxen, and the little gooseherd drive her inquisitive flock up the street in the wake of the wains. Then away to Ebermannsfeld, where there is a dye works. The village is full of wheels and streams, which, somehow or other, are not stained with the crimson and purple dye of the wool that is hung and twisted in the open air, carried about in baskets, and generally seems to look out of every window and door in the place; otherwise neither fouled water nor grimy smoke betray the presence of this local industry in the midst of rural nature.

The valley deepens and curves, the foliage is varied through pines, Scotch firs, lime, large-leaved oak, scanty beech and splendid poplars feathered to the roots, standing dark and upright as cypresses. At the Streitberg the hillsides are precipitous, and the limestone crags break out through the rich greenery in fantastic forms; a cluster of wooden houses like a Swiss village stands under the cliff where two roads to Baireuth branch off; the other side of the valley, Neideck, shows a ruined tower on a jutting cliff, masked below with green. A curve of the way beside the rushing trout-stream Wiesent brings you to your halting-place for the night—Muggendorf—not dulcet in name, but a romantic place notwithstanding. The village, with its hotels or pensions—much resorted to

by Germans—is built about a little church, with a square yellow-washed tower and pretty bulbous spire, at a meeting of the hills, where the grey rock cuts in jagged ridges and jutting crags through barren heights of turf, and the woods shroud the lower flanks. The valley is green and luxuriant; the clear river rushes along turning many a wheel in passage, curving in and out but always swift and brimming. From this spot, as duly set forth in the guide-books, the tourist climbs the hills to see the curious fossil caverns and extraordinary freaks of geological formation which have made the locality famous. The road onwards towards Baireuth, which we chose as the most picturesque route, took us beside the stream and the meadows, delicious with lush grass and flowers beneath the dolomite rocks, which here, for the most part, play the most extraordinary tricks, and transform themselves into any and every shape but that of the ordinary boulder or cliff. Now and then, however, a fine piece of broad face or striking cleavage seems to rebuke the vagaries of its fellows. The colour is a fine warm grey weathered to a ruddy tinge. The names Rabeneck, Rabenstein, Riesenburg, and so forth, indicate the character of these strange rocks, which in the narrower and wilder parts of the valley seem fit haunts of the "ominous bird," or the abode of gnome and hobgoblin. The Märchen, which MORITZ VON SCHWIND, STEINLE in his younger days, KOCH, and so many German artists have delighted to illustrate, rush upon one's remembrance in these regions of fantastic beauty, which are all the more striking by contrast with the smiling fertility of the country which has preceded them.

A sharp curve to the right and round again, and a long drive through another and gentler valley, the sinuous windings of which, beside its flowing stream, seemed endless, brought us to Waischenfeld and the morning halt of our second day. Hence the road led up to more open land, the hills gradually receded and lay around in the distance, and a long and rather monotonous route up and down the gentle swells of high tableland, varied by tracts of wood, brought us at last to Eckersdorf and its pretty green dell, and the castle and woods of the Fantasie. A mile or two further the familiar face of the old court town of Baireuth looked up to greet us from the sort of basin in which it lies, the ungainly block of the WAGNER theatre showed on the hill to the left, and the fact became apparent that a considerable development of very ugly dwelling-houses has followed upon the kind of artificial resurrection of Baireuth under the great dramatic festivals of which it has been made the scene.

For a month or two in the year Baireuth "wakes up to find itself famous"; carriages pour in from the towns about and stand for hire in the usually silent broad main street; the principal hotels and the restaurant on the hill are crammed with visitors, and on the days of performance dine their guests by hundreds, the repast gaining a special flavour to the curious through the presence of dramatic celebrities from the great theatres of Germany, assembled in Baireuth as the cast for the WAGNER *Bühnenfestspiel*. At the last performance of "Parsifal" this year there was a rush of musicians and critics from London, whose season barely set them free in time, and many of whom travelled direct out and back again—a piece of professional or artistic enthusiasm implying no small endurance. It was universally agreed by those who know that the *ensemble* of the performance of "Parsifal" was this year the finest yet achieved. The double alternative cast was splendid in power; the chorus singers were trained soloists from Munich; the orchestra, under Herren SEIDL and LÉVY, played with astonishing fire and *finesse*; the machinery for the spectacle had been brought into thorough working order, and certainly accomplished a grandeur of illusion which might satisfy the most exigent lover of the united arts. The enormous depth and height of the stage facilitated the building up of the interior of the domed and galleried temple of the Graal, its vista of pillared aisles and gemmed and golden walls and arches of Moorish type, with a grandiose effect not possible elsewhere. The double procession of knights and choristers is literally seen in a perspective of solemn movement that is removed from even association with stage contrivance, and the management of growing or fading light athwart the rich architecture and impressive figures is for pictorial as well as emotional effect quite unique. This tableau, which occurs in the first and last acts, is far the best. Next in artistic management is the interior of the magician's castle, a sort of Saracenic tower half in ruins. The transformation scenes are cleverly managed,

and some of them beautiful, especially the collapse of the unholy bowers and the sudden apparition of Montsalvat in a glow of golden sunshine behind. The previous scene of the temptation of PARISAL by the Blumenmädchen and KUNDRY is a little too German and childish in the notion of magnified garden flowers of the gayest colours, like a huge piece of Berlin needlework. The colours are prettily managed, but the effect is artificial and not mystic. The first scene of the last act, a forest opening, with hermit's hut and the meadows flowering about the feet of Montsalvat, is very well planned, but suffered from the ill-straining of the background, which up to the last performance had an ugly and disillusionising fold across it. The tableaux generally gain immensely in effect and illusion from the practice of wholly darkening the auditorium and from the concealment of the orchestra, both points being really essential for that completeness of æsthetic influence which elevates the musical drama into legitimate and unfettered art.

The financial success of this year's enterprise and the growing resources of the Wagner-Verein justified the committee in announcing a repetition during July and August of next year, and if the same spirit of artistic conscientiousness carried into the smallest detail animate the performances as was manifest this year, in remembrance of the dead composer's wishes, one may prophecy a successful issue. It is not a little pathetic, whether one be an adherent of RICHARD WAGNER or no, after witnessing the magnificent result of his artistic energy at the great theatre on the hill, to come down into the garden of "Wahnfried" and see the plain slab of granite that covers his grave, by his own desire left without name or inscription of any kind. "One honours the remembrance of an artist," he said, "more by the performance of his works than by laments, laurel wreaths, and monuments." How far posterity will desire to justify his words time only can testify.

Meanwhile Baireuth lives upon the incidental honour of the *Bühnenfestspiel*, but fortunately for the dignity of such distinctive character as the old town possesses, does not break into any ridiculous renovations or elevations within, contenting itself with building villas and offices on the outskirts, and as yet with quite simple and sparse accommodation of shops, so that it becomes sometimes a puzzle to know how the Baireuth folk get clothed and fed withal. Altogether the place is not without attractiveness; massive houses with the deep picturesque roofing that gives colour and varied form, spacious irregularly-shaped *Plätzen*, a stately Schloss in the town, and a respectable residence with surrounding alleys and gardens, side streets that end in the fields or entice you into a silent *cul-de-sac*, a rococo monument or two, picturesquely ugly, in the squares; an old brown church of unpretentious Gothic, a river, the Red Main, that winds in unexpected places; the broken ground on which the town is built, the wide sweeps of wooded country around, backed by the high horizons of the Fichtelgebirge and the Frankische Schweiz, and an indescribable air of faded respectability that pervades the town itself, give a character of its own to Baireuth not without charm. On one side, a few miles out, is the château called the Fantasie, full of remembrances of MARIE of Orleans, wife of ALEXANDER, Duke of Würtemberg, and surrounded by park and woods; on the opposite side is the Eremitage, a one-storied, fantastic building covered with coloured spars, ingeniously worked into a pseudo-Classic design, which was erected by the Margraves GEORGE WILLIAM and FREDERICK, at the commencement of last century, and reminds one of certain descriptions in "Consuelo" of the great FREDERICK's days. A sort of deep arch, with side openings in the garden, has been used and possibly was designed for open air dramatic performances, by the present King of BAVARIA, the select audience ranging itself *im Grünen* beneath the trees. Nut-tree alleys and terrace walks and a tasteful admixture of the wild and the artificial in landscape gardening make the grounds of the Eremitage a pleasant resort, to which a restaurant outside adds that attraction of coffee and beer indispensable to the German sense of fitness. On the "off" days of the dramatic performances the carriages of visitors are driven as a matter of course to one or other of these two points, while the more enterprising take a further stretch into the Fichtelgebirge or the Franconian hills and valleys, through which the reader has accompanied us. Driving along at his ease, he might have seen, as we did, parties of young fellows, often shabby and footsore, trudging on foot into Baireuth—pilgrims, after the enthusiastic German fashion, to the old town

which enshrines for them the temple of an art faith; for it is one of the anomalies in the phlegmatic Teutonic temperament to be liable to acute fevers, such as the *Sturm und Drangfeber*, the *Wagnercult*, and the *Judenphobia*.

But the last performance at the theatre is over, and in two days Baireuth, as if by magic, is cleared of visitors, and falls back into accustomed slumber. We are off with the rest of the world, and strike down the valley of the Main to Bamberg, the picturesque head-quarters of episcopal dignity.

## PARIS NOTES.

THE latest details procurable concerning the Triennial Salon des Beaux-Arts, which is to be opened to-day, Saturday, show that it will contain 717 paintings from 372 artists. No limit having been fixed to the number of works admissible from a single artist, M. Alexandre Cabanel has sent as many as ten; M. Jules Dupré contributes eight hitherto unexhibited works; MM. Harpignies, Hébert, and Jules Breton each send seven; MM. Augé, Bastien Lepage, Bonnat, Choitrin, Guillaumet, Henner, Machard, and Meissonier each six; MM. Emile Breton, Débat Ponsou, Delannoy, Lecomte du Nouy, Philippe Rousseau each five; MM. Berne-Bellecour, Raphael Collin, Dubufe (deceased), François, Ch. Landelle, J. Lefebvre, Maignan, Maillart, Mesday, de Nittis, Pelouze, de Penne, Saintin, Thirion, J. Tissot, Valadan, P. Vayson, E. Vernier, and Vibert each four; while twenty-five other artists have each sent three. The sculpture section will contain 297 works by 154 sculptors. M. Barrias contributes six—the greatest number by one sculptor; MM. Lanson and Delaplanche each five; MM. Chapu, Guillaume, Injalbert, Marqueste Monly, and Thomas each four; MM. A. Lefevre, Isidore, Bonheur, Cavelier, Chatrousse, Chrétien, Crauk, Idrac, Labavie, Le Duc, Lemaire, Longepied, Mabile, Marioton, Mercié, Moreau-Vauthier, Printemps, and de St. Marceaux each three.

The first prize in the Ischia Tombola, a painting by M. de Nittis, has been won by a private in the French Artillery, who naturally accepted the 10,000 frs. offered by the committee in lieu of the picture.

The Académie des Inscriptions et Belles-Lettres has elected M. Paul Meyer, professor at the Collège de France and director of the Ecole des Chartres, as recipient of the Biennial Institute prize of 20,000 frs.

The Carnavalet Museum has just purchased an interesting drawing of a scene in the history of Paris by Prudhon, the celebrated painter, of *Justice Overtaking Crime*, which has long been possessed by the Louvre. The sketch represents the courtyard of the Bastille immediately after its surrender to the infuriated mob on July 14, 1789. The governor, M. de Launay, is on his knees before a group of armed men, begging them to spare his life, which they are preparing to take. Above, flying in the air, are three allegorical figures that bear a strong resemblance to the avenging angels in the Louvre picture.

The underground rooms at the Paris Observatory—intended to be always kept as near as can be to one temperature for the study of the magnetism of the earth—are now completed. In their construction, special attention has naturally been devoted to secure the greatest possible isolation and stability. An outside wall of the hardest limestone and concrete—6 feet thick—encloses a rectangular space of 40 mètres by 14. The rooms erected within this space are separated from the outside wall by a passage 6 feet 6 inches wide, the walls have a thickness of 2 feet 9 inches, and are also built of limestone and concrete. Each room communicates with the adjoining ones as well as with the northern gallery, where access is had to the upper air. The height to the keystone of the roof-arch is 12 feet; the vaulted roof is 3 feet 3 inches thick and is covered with 6 feet 6 inches of soil, the upper surface of which is covered with shrubberies and turf, so as to protect it as far as possible from the direct action of the sun and frost. Air shafts have been established in the two end rooms in order to combat the damp when required; the lighting will be done by gas, but, if the resultant heat should at any time become inconvenient, arrangements have been made for lighting from without by means of a series of powerful reflectors.

A Site has been fixed on for a high-class school at Dunfermline. The building, it is proposed, should accommodate about 300 scholars, the cost of the erection being estimated at about 5,900/.

## ART EXHIBITION AT STOCKPORT.

A FINE-ART exhibition was opened at Stockport, on Monday, by Lord Egerton of Tatton. Owners of private collections in the neighbourhood have lent many valuable paintings and other works of art for the occasion. Lord Egerton in opening the exhibition made a short address, and in the course of it he said that in nearly all the large towns of foreign countries the artisans had means by public museums and otherwise of seeing many of these works of art for themselves, but that in most of our local towns until quite lately there were no such provincial museums. In Italy in every large town there was a good museum and art gallery, and there were the churches always open, some of them containing a number of the most beautiful works of the Italian painters. These were open for the commonest artisans to enter, to study, and to appreciate, as they did most thoroughly. We could not compete with Italy altogether in that respect. We had not the same artistic wealth in this country handed down from previous ages as the Italians had, but we had a growing school of art in this country which required encouragement and education. In looking at questions of art we must remember that the span of human life was nothing in connection with the progress of art. As the old saying was, "Life is short, art is long," therefore they were, he trusted, doing something in endeavouring to set up a school of art in that town which would last beyond the lives of any present, and would have a lasting influence upon the trade and upon the manufacturers of the town. Even if he were to advocate such an art instruction on the lowest possible grounds, he would do so on the score of the pleasure which it conferred on those who studied it. That led him to ask what was art, and what was the object of art, such as they saw before them? The object of art, however manifold its phases might be, was, as he held, in the long run the study of nature in its highest processes and most beautiful forms. What could be more elevating and refining than that—to raise oneself from the commonplace present to the study of all that those who had made it their business to study nature had selected as the most beautiful and fitting. Therefore, he said that on every ground, on the ground of expediency and on the ground of producing good results to those who study art, the study of art was to be recommended in all our large towns. In conclusion, Lord Egerton urged the importance of the study of Indian art, seeing that this country has now the largest trade in the East that any nation has or is likely to have. Under these circumstances it was well that our manufacturers and artisans should study what was acceptable to Eastern customers, seeing that if we had not the markets of Europe we might have those of India, China, and Africa.

## M. CHESNEAU ON MR. MADOX BROWN.

M. ERNEST CHESNEAU writes in *La Peinture Anglaise*, Ruskin's last Oxford lectures, as follows: I have still to speak of two men who, though not pre-Raphaelites, are on the borders of pre-Raphaelism—Mr. Madox Brown and Mr. Burne Jones. Of all British painters the former is he whose art gives the largest amount of dramatic emotion. The second, in respect of colour and of intensity of mystical conception, of passionate poetry, is the greatest master of the existing English school. Mr. Madox Brown seldom exhibits, but in 1865 about a hundred of his paintings were shown at 191 Piccadilly. Amongst them was his *Farewell to England*, and the most celebrated of his pictures, *Work*, which the engraving has made popular, a composition of importance, full of philosophical and social meaning, the work of a moralist quite as much as that of a painter. It occupied twelve years of the artist's life. Its æsthetic principles are not those of the Latin race. We infinitely prefer the earlier works of 1845 to 1855—*The Virgin and Child*, *King Lear* and *Cordelia*, *Cordelia and her Sisters*, some beautiful landscapes and portraits, his illustrations to the Bible, his cartoons for the coloured windows of St. Oswald's Church at Durham, as also his *Haydée* of 1882. Perhaps Mr. Madox Brown's work is too abstract, perhaps it is sometimes too closely connected with the beginning of the Italian Renaissance, at least with Botticelli's tragical *Entombment*; perhaps he draws his inspiration too directly from the poets, but at any rate he takes us away from the vulgar pettinesses of real life. It must be said, too, that this very noble artist, who was the very independent friend of the pre-Raphaelites, has never accepted their exclusive æsthetic principles. If he had imposed on himself the rule of never painting except from the living model could he ever have produced his *King Lear*? He has always given much room to imagination, and has never been bound by any convention. He varies his methods according to his subject, and does so with the rarest address. The phenomena is so rare that as a proof of it we reproduce here four subjects belonging to the most different orders of feeling; passionate in *Romeo and Juliet*, deeply religious in *The Widow's Son*, historical with remarkable understanding of gesture and expression in *King Lear Dividing his Kingdom*, proudly heroic in one of the frescoes which the valiant artist is just finishing in the Manchester town hall. This task forms a

noble crown to a fine artist-career. We give the cartoon of one of Mr. Madox Brown's frescoes, *The Danes driven out of Manchester*. The reader will notice the admirably simple gesture with which the Danish officer shakes his sword just as he is going through the gate. Can we not hear his words? Does he not seem to say, "All right, we shall meet again!"

## TRADES' HALL COMPETITION, GLASGOW.

THE members of the Trades' House of Glasgow held a special meeting on Monday afternoon, when Mr. Reid occupied the chair. It was reported by Mr. T. Weir, the clerk, that Mr. J. Honeyman, architect, Glasgow, had presented his report on the six competitive designs for the new hall. The three Mr. Honeyman mentioned in the order of merit were: (1) "Unity" (estimated cost, 18,000*l.*); (2) "Bis I." (16,600*l.*); and (3) "Bis" (17,250*l.*). On the motion of the chairman, seconded by ex-Deacon Convener M'Onie, it was unanimously agreed to reaffirm former resolutions, to the effect that the existing buildings should be taken down and reconstructed on the present site, at a cost not exceeding 18,000*l.* The chairman moved that, subject to the approval of the various incorporations, reconstruction should take place in conformity with the "Unity" design; and that the incorporations should be recommended to take shares in the new building in proportion to those held in the present one. Mr. M'Ewan seconded the motion. In the course of a discussion which took place objection was taken to the fact that the hall, under that design, would be up two stairs, 28 feet above the ground. It was agreed to add to the motion a remit to the building committee to adjust with the architects any alteration that might be considered necessary. The acceptance of the "Bis I." design was moved as an amendment by Mr. Newlands, seconded by Mr. Marshall. On a division the original motion, with the additional remit, was carried by eighteen to eight votes. The sealed envelope which accompanied the "Unity" plans was then opened, and the authors of the design were found to be Messrs. Campbell, Douglas & Sellars, Glasgow, the architects for the St. Andrew's Hall and other public buildings in the city.

## TAPESTRY AT THE ZURICH EXHIBITION.

AN interesting display of ancient tapestries have been gathered together at the Zurich Exhibition. The specimens included are of almost every age and every class, from masterpieces of Mediæval art, with wide borders of imperishable flowers and scenes from sacred history, to embroidered hassocks, carpets, and altar cloths. One of the most ancient specimens is a grand linen carpet dating from the end of the 11th century, richly embellished with Romanesque designs and covered with mysterious symbols, the key to which has been lost. In a contiguous case is a similar carpet of the 16th century, on which is wrought a hunting scene, all the animals depicted being surrounded with thistles; and the general effect of this singular combination, though *bizarre*, is neither inartistic nor unpleasing. Another scene, depicted on a tapestry of the same age, is Bathsheba in her bath, with King David looking on from a balcony. A slave is offering to the beautiful wife of Uriah fruit and confectionery on a salver. Among the fruit are pears and grapes: among the confectionery some *braetzeli*, a sort of pastry as popular in German Switzerland now as it appears to have been in the 16th century, and which the artist evidently thought was equally popular in Judea. The patterns are wrought with white and blue yarn and gold thread. Many of the tapestries are emblazoned with crests, devices, and coats of arms. Among the most noteworthy, both by reason of their historic associations and their artistic merits, are the arms of Hans Krafft of Willisau, and of his first wife. Krafft served as colonel of the French Royal Swiss Guards, and was afterwards a magistrate of Lucerne, where he died of the plague in 1575. A tapestry worked in 1559 depicts the misfortunes of Jonas, and the fair artists by whom it was designed have bestowed upon the disobedient prophet features so unmistakably Zurich that you have only to look round to find a face that might have served as the original. Next in number to biblical scenes are episodes from the national history, the favourite subjects being the three Switzers taking their famous oath in Grütli meadow, Tell shooting the apple from his son's head, Baumgartner killing in his bath the murderer of Wolfenschiessen. Worsted tapestries are less numerous than those in linen, probably owing to the greater difficulty of preserving them. But among them are some exceedingly interesting and beautiful specimens, albeit the designs are less original and fantastic than those of the linen tapestries. One is the famous and incomparable tapestry of Kyburg. It is 1 mètre 64 centimètres wide and 1 mètre 89 centimètres high, and records the genealogy, with forty portraits in needlework, of the Dillingens, the Kyburgs, and the Dukes of Swabia. This tapestry bears the date of 1568, and an entire article might be devoted to its description. One of the cases contains specimens of ecclesiastical and sacerdotal tapestry. Many of these are of great splendour and

high antiquity. One, a Messegewand, dating from the 16th century, has for the principal figure a cross, on which are placed, wrought in relief, the effigies of a number of biblical characters. On another sacerdotal vestment is depicted a crucifix, and it bears in enamel the arms of a Margrave of Baden and a Countess of Saxony. This garment belongs to the 15th century, and is ornamented with gold and silver pendants. Still another priestly robe, a *pluviale* of the 14th century, though much faded and indifferently wrought, has an interesting history. It was embroidered by Agnes, Queen of Hungary and wife of King Albrecht, and given by her in 1318 to the Convent of Engelberg, to which it still belongs. A yet more ancient and not less interesting relic is a pair of shoes once worn by the Abbess Hildegard, founder of Our Lady's Church of Zurich. As the daughter of Lewis the German died in 859, these shoes must be more than 1,000 years old; yet one of them shows that the tradition which makes the Royal Abbess lame bears the impress of truth. Perhaps the most magnificent sample of needlework to be seen in the exhibition is an altar cloth (*antependium*) in white satin, wrought in the 17th century and sent by the Convent of Einsiedeln, whose property it is. In the centre is the *Ascension of the Virgin*, at each corner a landscape, all so perfectly executed that they may vie with the best paintings in enamel. Over the rest of the piece are strewn birds, flowers, and fruit, so marvellously wrought that, as a local connoisseur observes, it is necessary after examining it to make a visit to the machinery department in order to convince yourself that this is really an age of progress.

### THE CHELSEA INFIRMARY.

AT a recent meeting of the Chelsea Board of Guardians, of which Sir Charles Dilke, President of the Local Government Board, is a member, Dr. Bridges, Medical Inspector of the Local Government Board, said he wished to take the opportunity of congratulating the Board on the completion of their new workhouse building, which he had had the pleasure of carefully inspecting. It was extremely well constructed, and admirably adapted for the purposes for which it was erected. A short time ago he was inspecting the old infirmary rather carefully, and he should like to call attention to the sanitary arrangements, which did not compare favourably with those of the new building. No doubt many of the Board had noticed that in the latter there was a very excellent disposition of the soil-pipes, waste-pipes, &c., connected with the lavatories. He would like to urge the Board to make the same arrangements in regard to the infirmary.

The chairman, Mr. C. Blore, said he believed such an alteration was in contemplation.

Dr. Bridges was understood to say that at any rate there could be a better system of ventilation at the infirmary.

The new buildings are the work of Mr. A. Thorn, builder, and were designed and erected under the superintendence of Messrs. A. & C. Harston, architects.

### PROPOSED BRISTOL CHANNEL OBSERVATORY.

IT is proposed to establish a permanent meteorological observatory for the Bristol Channel. A design for the tower from the designs of Messrs. James, Seward & Thomas was lately published in *The Architect*. Mr. E. J. Lowe, F.R.S., who, for the last forty years, has carried on a regular series of meteorological observations at Highfield, near Nottingham, has recently purchased the Shirenewton estate, near Chepstow; and being convinced of the real importance of establishing an observatory which may be carried on through future years without interruption, he has generously offered to present the whole of his valuable collection of meteorological instruments, together with his books and papers, towards the establishment of such a permanent observatory, for which he also offers to give the site, together with such stone and lime as may be required for the erection of the necessary buildings, provided a sufficient sum can be raised in the district to build the same, and to provide a small endowment towards the maintenance of a limited staff of assistants, who would, in the first instance, be under his gratuitous guidance and supervision. Previous to making this offer publicly known, Mr. Lowe conferred with the Meteorological Department of the Treasury, by whom Mr. Scott, F.R.S. (the Director of the Department), was sent down, and his report was in every way most favourable, both as to the great utility and importance of the scheme, and also as to the admirable site which Mr. Lowe proposed to offer. In the present transition state of the study of meteorology towards an exact science, it is all important to establish some one or more permanent observatories where the barometrical and other waves may be carefully watched, especially the Atlantic waves, when they first reach the shore, and before they become more or less disguised by moving across Great Britain; for it becomes a question of importance how far the various conditions of such atmospheric waves become changed after passing across the

Atlantic, during their transit over an unbroken expanse of water. A more perfect knowledge of the weather on either side of the Atlantic would soon lead to a vast increase in our insight into the effects produced in the waves of air moving from the Equator towards the Pole, or *vice versa*. A more exact knowledge of these phenomena must be of infinite benefit to mankind in general, and to those engaged in maritime service in particular, by tending greatly to diminish the loss of lives and of ships. The laws of meteorology are far more stable than generally supposed, and, no doubt, owe their origin to cosmical causes outside this world. That the various phenomena are in a cycle, to be repeated again and again, must now be sufficiently obvious. The known fact that solar spots are in cycles, that the Aurora Borealis displays are more frequent at certain periods of the cycles, and that all these phenomena seem to obey the same law, and to be ruled by the magnetic cycle, are facts that must seem to point out that we are approaching that time when the laws of meteorology may be understood, and when we shall encounter no great atmospheric disturbance without a previous knowledge of it. The Governments of America and France have seen the necessity of this, and are devoting large sums of money to attain the object in question. In a country like England, where so much private wealth abounds, almost all important undertakings owe their origin to individual and corporate munificence rather than to the State; and until great discoveries are made, and their national importance recognised, the Government can hardly be expected to offer it material aid. Besides closely watching and accurately observing the various atmospheric changes that take place from time to time, there requires an almost inconceivable amount of careful uninterrupted work to thoroughly understand the laws of meteorology. England does not at present possess such an observatory as is proposed to be established, and it would be a great honour to any locality to boast of the first permanent station, the value of which cannot fail to be understood. The time is not far distant when observatories will be recognised to be as essential as our hospitals and other institutions. Meteorology is so intimately connected with health, navigation, and agriculture, that a joint study must prove of mutual benefit. If such an observatory were once established, there could be little doubt of its ultimate success financially. Donations and bequests from scientific persons would follow as a matter of course, and so soon as the general practical utility became recognised, the philanthropists would contribute as fully to the maintenance as to such other institutions which have already been shown to be a benefit to the community at large. The report of Mr. Scott proves that the advantages of such an institution would be great, far greater, indeed, than the exertions required in order to establish it. The establishment of an observatory in this part of Great Britain is most desirable, and urgently needed, while the particular site selected is second to none, having an extended and unbroken prospect scarcely equalled in the United Kingdom. The Bristol Docks Committee and the Bristol Incorporated Chamber of Commerce and Shipping have passed resolutions in favour of the proposal, while the Meteorological Council of Her Majesty's Government have said that if such a station were in existence, similar to the Bidston observatory in connection with the Mersey Docks Board, they would be perfectly ready to publish the returns with those of other climatological stations, and to have the station inspected regularly. Letters approving the establishment of the observatory have also been received from the Duke of Beaufort, the Earl of Derby, Sir G. B. Airy, F.R.S. (late Astronomer-Royal); Sir Joseph Hooker, F.R.S., Director of the Royal Gardens, Kew; Mr. Christopher Thomas, Professor Thomson, Dr. Burder, Mr. Henry Taylor (ex-Mayor of Bristol), Alderman Edwards, Mr. W. F. Denning, F.R.A.S., Mr. Thomas Howard (engineer of the Bristol Docks), and others.

### THE ARTISANS' DWELLINGS ACT.

DR. GRIFFITH, the medical officer of health for the parish of Clerkenwell, has reported to the Vestry of that parish that, pursuant to the provisions of the Artisans' and Labourers' Dwellings Improvement Act, 1875, he has made the following official representation to the Metropolitan Board of Works, viz.: That Bishop's Court, Smith's Place, and Slade's Place are unhealthy areas for the purposes of the above-mentioned Act, for the following among other reasons, viz., that the buildings comprising these areas are either unfit for human habitation, or that diseases, indicating generally low condition of health among the inhabitants, have been prevalent, as mentioned in sec. 3 of the Act, and that there is also a want of light, air, and ventilation, or proper conveniences to the houses or groups of houses within such areas. Dr. Griffith also informed the Vestry that there were a large number of unhealthy areas he would have to report upon. The houses mentioned above were very badly constructed, and should never have been allowed to exist for one hour. In some of them there were no back yards nor room for closets, and others were wanting in light and air, and all should be closed and done away with at once.

## NOTES AND COMMENTS.

IN most towns the authorities find a difficulty in preventing builders from encroaching on the normal or prescribed line for frontage. But in Huntly there is now a case where the law is supposed to be broken by keeping back buildings. The Brander Library has been set out in such a position, and, what is even more remarkable, the trustees say that the Huntly Commissioners cannot interfere. The clause in the local Police Act gives authority whenever "any part of a house or building projects beyond the regular line of the street, or beyond the front of the house or building on either side thereof." It is accordingly maintained that there is no power vested in the commissioners to do more than set back a house. The trustees have, however, declared their willingness to consult with their architect; but as the subject has been carefully considered before now, and no remedy was apparent, it is not likely that the building will be brought forward.

THE Huntly case is suggestive of a grievance through which architects and their clients often suffer. The lines for streets are laid down by town surveyors, who generally are indifferent to architectural effect. Sometimes a diagram is prepared to indicate the kind of buildings which are supposed to be best adapted for the new streets, and a collection of the suggestions would form a strange commentary on English official architecture. In fact, surveyors and town councillors are as fond of uniformity as are the railway engineers, who paint the exterior of all classes of carriages in the same colour. It is needless to say that for architectural effect it is not always an advantage to have the front of a building coinciding with the surveyor's line, and a great many buildings are sacrificed to the official regulations. If the local authorities consulted the amenity of their towns, they would be more disposed than they now are to allow occasional deviations from the surveyors' frontages.

THE late Mr. ALFRED B. RICHMAN, of the Strand, whose sudden demise was lately reported, was only 39 years old at the time he died. Having purchased the business of the late Mr. COOMBES, picture dealer, and succeeded to and carried on the business in the name of that person up to the time of his own death, Mr. RICHMAN was a most energetic man of business, and a successful picture dealer and picture restorer of no mean order. On the occasion of the recent restoration of St. Stephen's Church, Walbrook, the famous altar-piece, the *Stoning of St. Stephen*, was found to be in a very dirty and dilapidated condition, and the restoration of it was entrusted by the committee and their architect, Mr. THOS. MILBOURN, to Mr. RICHMAN, and the creditable and successful manner in which he fulfilled his task met with well-deserved praise at their hands. At the recent annual excursion of the Surrey Archæological Society he appeared in robust health, and responded to the toast of "The Ladies," and threw out some practical suggestions as to the advisability of ladies freely and often using their pencils in sketching objects of interest in Surrey, and thereby adding to the portfolios and sketch-books of the society.

WE learn that offers for undertaking works of re-edification in the island of Ischia are being continually sent to the Italian Minister of Public Works by Belgian, English, and French firms, accompanied by designs for various kinds of houses in iron, wood, or both materials combined. Italian firms have only made offers for furnishing the wood or iron. As the Italian Government cannot think of any definite erection of towns in Ischia, its work being at an end when the temporary barracks for the protection of the population are finished, it will scarcely accept any of the offers made. It will, however, directly accept offers for the erection of public buildings, such as schools, hospitals, churches, &c., expecting the expenses to be reimbursed by those for whose benefit they are made, or indirectly by subsidising and promoting the construction of houses by the commune or the province. Such offers will be accepted as present the most complete project and the surest guarantees. Peculiar privileges will be conceded. At present the idea is to grant ground gratis to anyone desiring to build a house, and the question of exempting or reducing the taxes on building, &c., is being considered.

GEORGE COLE, the landscape painter, whose death took place on Friday week, at the age of seventy-three, was a self-taught genius, whose career illustrates the power of strenuous application and perseverance to conquer untoward circumstances. He first became known at Portsmouth as a portrait painter. On removing to London he devoted himself to landscape painting. He first exhibited in 1840, and frequently thereafter at the Old British Institution. One picture, about the year 1845, *Don Quixote and Sancho Panza with Rosinante in Don Pedro's Hut*, attracted much attention. Among his many popular earlier works may be mentioned *Pride and Humility*, engraved by H. GRAVES & Co.; *A Welsh Interior*, *Ebenbergh Castle*, *Llandogo on the Wye*, *Homestead in Carnarvonshire*, and *The Last Load*. His more recent works will be fresh in the memory of the visitors to the Suffolk Street Galleries. In 1850 he was elected a member of the Society of British Artists. In 1864 the Society for the Encouragement of the Fine Arts awarded him their medal for a landscape which was remarkable for a brilliant effect of sunshine after rain. He is deservedly regretted by all who knew him.

THE exhibition of original drawings by RAPHAEL at the British Museum will give the public some notion of the wealth of the Department of Prints and Drawings. Some of the subjects will be familiar to readers of *The Architect*, as they were reproduced some years ago. The beauty of those sketches is remarkable, and, looking at them, it would appear as if RAPHAEL could not help producing graceful lines. Some of them are evidently the work of minutes rather than hours, and yet there is exquisite subtlety to be found in the curves. Those sketches enable us to comprehend the unrivalled draughtsmanship that is seen in the cartoons at South Kensington. But what is wanted is an exhibition that would correspond with the late PRINCE CONSORT'S idea. It was intended to have a collection at Windsor of copies of those drawings by RAPHAEL which were absent from the Royal portfolios. The trustees of the British Museum or the South Kensington authorities could easily make arrangements to exhibit photographic and other reproductions of drawings of which the originals are not available. In this way RAPHAEL'S marvellous industry would become apparent. The sketches would also show that GOETHE was right when he declared that RAPHAEL was the purest among modern artists.

ON Wednesday last, at the Stratford police-court, a builder, of Leyton, was summoned for a breach of the by-laws in allowing a house in Oakdale Road to be occupied without giving the requisite notice to the surveyor of the board. It was stated in the prosecution that the defendant had failed to comply with the requirements of this section, and that the house, although occupied, was not connected to the main sewer. The importance of enforcing the by-law at the present time was urged, seeing that there were about 700 houses in course of erection, and, of course, it was almost impossible for the surveyor to know of the completion of a house if notice was not sent. The matter ended very properly in the defendant being fined and having to pay costs, though he pleaded guilty and had since connected the house with the sewer. A second and similar case having been heard in regard to another builder, payment of costs and fine was also imposed. We trust that Mr. DAWSON, the surveyor to the Leyton Local Board, will find that he will not be troubled again by such breaches of the law, after the salutary lesson that has now been given in his district.

SPECULATIVE builders, however, as well as other people, are always to be met with who are quite content to risk the chance of making some extra pecuniary gain by covert evasions of law. For one time they are caught tripping, they may escape scot-free some half a dozen times. It is questionable whether the small sums of money inflicted in the shape of fines on these gentry has a sufficiently deterrent effect to prevent others following their example. In the interest of the public it would be far more satisfactory if the law would sanction the imposition of a penalty of such magnitude that would once and for all render such malpractices impossible because no one would dare to court discovery, the risk being too great to be run,

## INDUSTRIAL ART SCHOOLS IN BAVARIA.\*

WE went to the Kunstgewerbe Schule, where we found Professor Strähuber, who had been asked by the director to receive us and show us the class-room and such of the students' works as had been left in the school. It is a handsome building with a central court glazed over and decorated by the students. There is much space, but the rooms are not very well lighted for day class-rooms, the windows not being high enough. The school is meant for artisans, but it is impossible to exclude those who mean to become painters if they fulfil the necessary conditions. It is full, so that 40 per cent. of the applicants are obliged to wait for vacancies. Every student is obliged to go through the architectural course, and this may be somewhat deterrent to painters. If they go through it they become, *ipso facto*, somewhat qualified as decorative artists. We were told that the drawings of applicants for admission who were known to be workmen were judged more leniently than those of young painters. The Academy at Munich being full, many young people who want to learn to paint pictures wish to enter this school.

There are in all 180 students, of whom about forty are Bavarians, and of these twenty who have scholarships receive 365 marks a year and free instruction. No Bavarian who is in other respects properly qualified need be kept out for want of money to pay the fees if he can show, by a certificate from the burgomaster of his town, that he is really poor. There are not many such, only two or three. Many of the students come from other countries, and some of these have scholarships from their own governments or towns. Students must work a year in the school before they can hold the Bavarian scholarships. All must be over fifteen and under forty, and the charge or fee is 15 marks a term. In some cases employers pay the fees for their clever workmen, with the hope that they may become more useful to them as draughtsmen or designers. The hours are from eight to twelve and from two to seven, and there are no other evening classes, so men working at their trades can only attend by giving up their work while in the classes. For such, daily attendance is not required, and they may come on one or two days in the week provided they bring certificates to show they have been at their work on the other days. With others, regular attendance is insisted on, and those who do not comply with the rule have to leave. If absent for three days a student has to give an account of himself.

Decorative painters who are not able to follow their trade in the winter often attend the classes regularly during that season. Every student has at the end of each term a certificate on which the professors report as to his progress, and, at the end of his course, on leaving the school, he has another certificate as to his proficiency. There are four grades of these. Among the whole number of students there are fifteen or sixteen who are about to become teachers in other schools, and these have to go to the Polytechnicum for two years on leaving the Kunstgewerbe Schule, and thus their general cultivation is improved. These receive, when placed, from 1,600 to 2,000 marks a year, and have much time for their own work. For very small schools the curriculum at the Polytechnicum is not insisted on. After being one year (two terms) in the school the student must choose and declare the trade he means to follow, if he have not one already.

We saw a number of the drawings which had obtained admission for students. They were of ornament done in pencil or in black and white chalk or in ink. They were very neat and careful, quite unlike French work, and rather too pretty and ladylike for artisans' drawing. There is no drawing from flat examples. The very flat reliefs from Padua are used. The other ornaments in relief used as examples are very like our own. There is a class for flat ornament, such as drawings for stuffs, for wall papers copied from books or prints, for painted walls and ceilings in colour, and studies in tempera (compositions or arrangements) are made from artificial flowers. We saw other coloured drawings which had been done from ceilings in Italian palaces by students who had been sent on a twenty-five days' tour, also large pieces of coloured decorative work with figures and ornaments, 12 feet by 4 feet, designed and executed by students. We were told there were ten or twelve in the school who could do such work. People who wish to decorate their houses apply to the school. The work is generally done in tempera, but other methods are used.

Every month there is a competition, and small prizes (books) are given for the best competitions of ornament. These are not done in the school. There is a lecture theatre, and here the students learn perspective two hours a week, geometry four hours, and the history of decorative art three hours. In the antique room were many heads and limbs and some small figures but no large ones. We were told there was no room for them and the study from them was not considered important. There is a sort of time test when heads are drawn in a week on winter evenings. We did not see any drawings from antique figures.

There is a living nude male model sitting every day from 7 to 9 a.m. in summer and from 5.30 to 7.30 p.m. in winter, and about

forty students attend. There is no painting, only drawing and modelling. The draughtsmen sit on the inside of the semicircle, the modellers outside, and a sort of raised form is used by the furthestmost. We saw some of the drawings from the life. They are much smaller than ours, not more than a foot high. We saw no modelling of round figures, but bas-reliefs of about the same size as the drawings. These were good in their qualities of relief. The drawings were neat and fairly good. We saw some excellent round modelled studies done from drapery put on an antique figure and others in relief of a piece of hanging drapery. In winter two hours daily are spent by modellers in sketches for composition, and some of these sketches we saw gilded or coloured; for instance, a knife and fork with ornamental metal and enamelled handles. In one room, where ornament is drawn in the evening, we found the (relief) examples propped up on the desk before each student's seat. The appliances for lighting the living model and the students' work by gas seemed very good, and much like some we had seen in Paris. We saw some ornament modelled from the flat, and altered so as to make the exercise one of composition. This had been cast. There is a moulder in the school, and these casts are sometimes utilised as examples to draw from in smaller schools.

Decorative painting seems to be much encouraged. The school building, or part of it, was formerly a stained-glass factory, and two large rooms once used for setting up the windows against a large light are now used for decorative painting. We saw some large pieces of wall-painting copied at an old palace of the King of Bavaria, to which some students had been sent at the expense of the school. As before stated, they are sometimes sent to Italy. We were told of two having gone lately. They had 800 marks to spend, and on their return had to show their work and give three or four of their drawings to the school. There seemed to be no fixed time or rule for such expeditions, but sometimes the Minister on visiting the school offered to find money.

The students at this school are allowed to attend the anatomical lectures at the Academy. We saw very good models in wax for wood-carving, also a wax model of a boat or galley with a figure to be executed in precious metal. In a room on the ground-floor we saw some technical work in process, metal-work, *repoussé*, and chased; also enamelling. There was a small forge and an anvil, and an oven or kiln for the enamel.

The girls' school is in the same building. There we saw studies in oil from flowers—natural. There was nothing very remarkable about the art-work we saw. They do lithography and wood engraving; of the latter we saw specimens. They also design for woven stuffs and for embroidery. The designs we saw were not interesting or remarkable for invention or for artistic feeling, being much like those done by the men.

The Dresden Kunstgewerbe Schule is supported by the State, and there is a similar one in Leipsic. It has nearly three hundred students, and is always full. The boys (there are no girls) may come at the age of fifteen, or directly after they leave the elementary schools if they are otherwise qualified. They more commonly enter the Kunstgewerbe Schule late, having in the intermediate time attended the Fortbildung Schule, or some other. They are taken on probation for six months. The test examination is very much modified at the discretion of the director or professors. If a young man has had good opportunities of study a better drawing is expected from him to entitle him to come in than would be looked for from another who had come from a school where but little time is given to drawing. In the latter case a drawing from a flat example of ornament would suffice. In the former, one from a cast would be required. The school consists of two divisions. All pay 30 marks the first year, but afterwards some of those who are promising, and at the same time needy, have free instruction. Of such there are from fifteen to twenty. Some students come the whole time, and others, as in Munich, two or three days a week.

I will mention some of the students' works remaining in the school from the exhibition: Enlarged drawings done on squared paper for weaving for a small bit of stuff (silk) containing the repeat of a pattern. This is an exercise of a technical kind requiring little practice in drawing. Large drawings or tempera painting in black and white for lace curtains: the size of the woven stuff, very neatly and skilfully executed, needlessly so. A large coloured drawing of the corner of a carpet done apparently in squared paper, larger, but no better in design than some in our last national competition. Coloured drawings of advertisements and calendars with ornamental borders and figures very skilfully done, very German in style, to be executed in chromo-lithography. They were mostly done by a student of twenty, who had been three years in this school, but in his trade as a lithographer had worked at this kind of thing before. He was then painting, from nature, figures and still life in oil, and the professor said he showed no tendency to leave his trade in order to paint pictures. A few water-colour copies from flat examples, which were pretty well done, but seemed to serve no purpose beyond the amusement of the student.

Some very clever but mannered drawings in water-colours were shown us of the size and character of our Christmas cards. They were meant for reproductions in colour-printing, for which they were well suited. In them flowers and figures were arranged with

\* From the report by Mr. T. Armstrong, art director, Science and Art Department.

ornament, but treated in a realistic manner. We were told that the student who did them was only seventeen, and had been but two years at the school. I expressed surprise, and then the explanations given were that he was a lithographer, and had been doing this work before he came to the school. They were most deftly done, without being remarkable for anything but their execution. A small coloured drawing of ceiling decorations and others of jewellery were very neatly executed.

A young man of twenty-one, who had been a year and a half in the school, brought a drawing he had just finished to show us. It was a festoon of roses of different colours, with the leaves done rather above the size of nature on a grey ground in tempera. It was like the work of a clever French decorator, but rather harder. Natural flowers had been used as models, and the work, which pretty well filled a space of 4 feet by 1½, had been done in five days. We saw two or three other works of a similar kind, among others an upright panel of flowers in tempera, arranged and painted with a reference to nature on paper, about 5 feet high by 1½ wide. They were much like the clever French paintings, but not so good as the best internal decorations in Paris cafés.

Some studies of flowers and fruit done in tempera on tinted paper without background were much better, some of them very good, but they were simply copied from a small group without arrangement. We saw a student painting a still-life group very much like those set up in our schools. This was said to be his first work in oil, but the execution was dexterous. We were told he had already painted a good deal in tempera. Other paintings in oil from the same group were very cleverly done, with a certain bravura of manner. None of these things were better than such work done in our own schools at South Kensington. There were some well-executed drawings of cabinet-makers' work; not better, however, than would be produced in the best shops in London.

Small plaster casts of Renaissance ornament had been used as models for sgraffito work, and had been enlarged, somewhat altered, and drawn out flat. The same process was gone through as an exercise in colour, for flat decoration, the relief ornament being translated into flat coloured decorations; a very useful exercise. A large and well done heraldic drawing in tempera was shown to us. These works had all been in the recent exhibitions, and cannot be accepted as examples of the average work of the school. We saw some but not many drawings of ornament. They were done with the stump and the point together on tinted paper, with black and white, well modelled, and very neat. The process seemed a laborious one. Of drawings from the antique we saw none. There were studies from the nude male model unusually large, 2 feet high, in which much white was used on tinted paper, and with background; a very vicious method. There were some smaller drawings from the life about a foot high, like the large ones done with a dexterous mannered touch; also careful drawings of skulls and of heads done from casts taken after death. These latter were executed with the point in ten sittings of two hours each. They had backgrounds. Similar drawings of heads—portraits of living persons—were there, in which charcoal was rubbed in with the finger, a stump not being allowed.

Professor Donadini explained his own method to us. When a student comes first into his hands he gives him some object to draw, and when this is done to the best of the young man's ability he decides whether it is worth while for him to go on. If it is, he puts him for a month to such work as he has already done, perspective and anatomy, and afterwards proceeds to teach him the technical part of the work to which he means to devote himself. If he is to be a lithographer or engraver, he learns to draw with lines. After drawing casts taken from nature (heads of dead people) and extremities, he does the same kind of work from life, and then proceeds to paint heads from the living model. He encourages his pupils to carry sketch-books always, and to use them in every-day life constantly. Anatomical sketches are made at home. Next comes drawing, and then painting, of the whole figure from the nude model. (We saw no such painted studies.) Every month he gives a subject for composition of the figure, treated decoratively. He told us that he has not found this painting from the living model dangerous to his students of decorative painting, as it is said to be by the Paris professors, and that none of them have left their proper work to become painters of pictures. We saw his own work, and found that he is an extremely skilful decorative painter of the higher kind. He had designs and models of considerable size of ceiling and wall paintings, which he had executed on a large scale. Though a Venetian, his artistic education was got under Piloty, of Munich; but there is something which is not German in his work. He gave us the impression that he is an enthusiastic teacher, and he showed us how he trained his advanced pupils to follow in his steps. In his studio there was a plaster model of a complicated ceiling, and from this he told us he cut out in paper the shapes of the different spaces to be decorated, and distributed them among the advanced students with instructions as to the general scheme of decoration. When these were done he put them into the spaces and criticised them afterwards, taking them out again and again for alterations and corrections, until a harmonious whole was arrived at. He said his pupils had executed a short time ago the painting of a very large triumphal arch which was put up for the

opening of the exhibition, and also a temporary ball-room in the royal palace. To these opportunities, to Signor Donadini's personal influence and talent, and to the carefully studied scene painting and *mise en scène* of the Dresden theatre, I attribute the skill shown in decorative painting. All methods of painting are taught, and tempera is especially encouraged.

We saw plaster casts of ornaments which had been modelled by the students, probably from flat examples, or enlarged and modified from small plaster examples. They were not good. There was a branch of a bay tree modelled in rather high relief, which was better. We were not shown any round figures, but several reliefs done from round examples or from photographs, the figures from the Medici tomb, and the *Adam* of Michael Angelo. These were rather large, about 3·6 high; and there were some male figures and some antiques of the same size; also a large anatomical study of legs. They were not very good, not so good as the best at South Kensington. There are evening classes in this school, which are not thoroughly organised yet. They are under the State, but are helped with money from the Kunstgewerbe-Verein. Here the students pay two marks the term, and are taught geometrical drawing, drawing from flat examples, and from casts.

## THE FAÇADE OF OLD BURLINGTON HOUSE.

MOVEMENT has been set on foot with a view of inducing the First Commissioner of Works to consent to the utilising of the façade and colonnade of Old Burlington House, which has been described as "one of the finest pieces of architecture in Europe," by embodying it in the main entrance to the new exhibition buildings in course of erection in Battersea Park. The colonnade, which was borrowed from a palace by Palladio, at Vicenza, together with the façade, was erected, according to Horace Walpole, by Richard Boyle, Earl of Burlington—himself a famous architect—in 1718, from his own designs; but Colin Campbell, in the "*Vitruvius Britannicus*," claims the merit of the design, including the gateway. The colonnade was the subject of an animated discussion in the House of Commons in June 1868, when Mr. Beresford Hope asked Lord John Manners, the then First Commissioner of Works and Public Buildings, whether it was true, as advertised in the London papers of the day, that Her Majesty's Government proposed to sell by auction the façade and colonnade of Burlington House, and if, for the sake of a few paltry pounds, such an act of vandalism was to be perpetrated, instead of preserving them to the nation by re-erecting them either at Kew, South Kensington, Kensington Gardens, or elsewhere. Lord John Manners, in reply, humorously suggested that he was open to receive a private offer for the purchase of the stones, but was at the same time prepared to consider the advisability of employing them as suggested. The result was that they were withdrawn from public sale, and as the stones were taken down they were numbered and carted away to Battersea Park, where they have lain ever since.

## MR. RAWDON BROWN.

A CORRESPONDENT has furnished the following particulars concerning the late Mr. Rawdon Brown, premising that the public are already acquainted with that gentleman's life and labours as an antiquary or "archivist," in the service of ancient Venice. We feel what that industry must have been which gave even a passing glance of attention to no less than 12,000,000 packets of manuscripts and other papers. But to those who did not know him, and perhaps still more to the comparatively few survivors who had that privilege, it may be interesting to hear something more of the man as well as of the student. It is now more than fifty years ago since he first entered that city as a traveller which he was destined never to leave again for more than brief periods of holiday. Venice was marked out for the natural home of Rawdon Brown, and he for her most devoted son and servant. Her "stones" aroused at once all the enthusiasm and dogged patience and determination of his nature, and he so soon peopled the amphibious old "Dominante" with the life of the past that, walking or floating with him through her network of passage and canal, such a period as the 19th century no longer existed. He knew the annals of every chief family, the origin of her innumerable escutcheons, and the dwellers associated with her most squalid "calli" and "campi." "A friend of mine once lived here," he would say, pointing to a court distinguished by more than common dirt and dilapidation. The immediate inference was that some modern Venetian, or, perchance, English visitor, had resided there, when it would turn out to be the father or brother of one Thomassina, a Venetian lady of the 15th century, who married a King of Hungary, whose letters he had lately unearthed. He was very jealous that all who ventured to treat Venetian subjects should observe the same faultless accuracy that he had attained, and no one detected the lack of that quality so readily. M. Yriarte's account of the Château of Maser, decorated by Paul Veronese, in his "*Vie d'un Patricien de Venise*,"

was a standing subject of protest and wrath. "Why, Maser has been the resort of Venetian holiday folk for years and years, and here comes a tinker and pretends to have discovered it!"

Rawdon Brown had his favourite discoveries and theories, with which he eagerly sought to imbue some listening companion. There was, for instance, the discovery of the three mulberries in the Moro arms, which Shakespeare had converted into the three strawberries on Desdemona's handkerchief; there was the theory of the Duke of Lerma's having served Cervantes as the original of Don Quixote; and there was some other theory connected with Margaret of Anjou's handwriting which, it must be owned, was rather obscure. But woe be to the listener who was not attentive! No one could be sure that he would not cross-question you next time. The inattentive listener was soon dismissed with some hint of "pearls before swine," while for one who had stood the examination with credit there were various rewards in store—a sight of Memling's breviary or of Marino Sanuto's diaries, which St. Mark's Library opened at his bidding. That library table could tell much about the departed English student. Day after day and year after year (the vice-librarian Lorenzi having regularly breakfasted with him at 8 o'clock), Rawdon Brown's truly English head, with his shrewd, shaven face and close-cut hair, would be seen poring over some dull and dusty delicacy; and equally, day after day and year after year, did his tall, slim, and well-knit figure, after his task was done, appear on the Grand Canal, rowing himself, gondolier fashion, to the Lido. It is long since he paid a visit to England. Some years ago he prepared to do so, but, stepping to the window, he looked down on the Grand Canal, all quivering and sparkling with the reflections from the Grand Bevelacqua Palace opposite, and, turning to his servant with a face of emotion, he said, "Toni, unpack my things; I cannot go."

It was but natural that Brown's friends should recommend the English Government to turn his knowledge and powers of research to practical purpose by engaging him to calendar such Venetian State records as bore upon English affairs.

Rawdon Brown was an inveterate Conservative. He never troubled his head with dreams of Italian unity, which he only associated with the supremacy of the mob and the destruction of manuscripts. He valued, also, the polished Austrian circle in which he had been a welcome guest, and grudged the loss of the privileges of a free port; but he lived to be reconciled to the change. His funeral took place on August 28, and was attended by old friends, Italian and English. His beloved banner of St. Mark, with the winged lion, was obtained from the Municipality by the Countess Pisani, an English lady and friend, and wrapped round him in the coffin. The service was held in the Protestant Church at the SS. Apostoli, and a funeral discourse read over him in the name of the authorities of St. Mark's Library by his friend Cecchetti, Director of the State Archives at the Frari, who set forth the pure and simple life of one whose zeal for the honour of Venice, knowledge of her history, and unostentatious charity to many of her humble citizens had converted from a stranger and foreigner to one whom they were proud, grateful, and eager to claim as their own—*il nostro*.

He now lies in that cemetery island against which the waters of the Adriatic perpetually break—a man of no common heart and head, crusty and odd occasionally, it might be, but racy, humorous, generous, faithful, and tender, the type of the bookworm, the old bachelor, the warm friend, and the true gentleman. Venice will hardly be Venice without him.

#### PATRINGTON CHURCH, HOLDERNESS.

THE annual excursion of the Yorkshire Archæological and Topographical Society was made to Holderness, where the parish church, dedicated to St. Patrick, "the Queen" or the "glory of Holderness," was inspected. The church is in the Decorated style, and was probably built during the early part of the reign of Edward III. It is cruciform in plan; the front consists of a solid block of granite covered with sculpture, and there is an Easter sepulchre in the north wall of the chancel. Mr. Micklethwaite, F.S.A., in explaining the architectural details of the sacred edifice, said that was the first time the members of that society had met in an important parish church, although they had had a great deal to do with abbey and collegiate churches. He should say that nearly all parish churches stood on sites that were occupied in the same way even before the coming of Augustine. Parish churches could be traced back to the time of the first stone church, which, if not of Saxon, was of twelfth-century work. The church in which they were assembled was generally stated to have been built entirely new out of the ground, all of one style, and purely fourteenth-century design. He hoped he should not offend anybody by saying it was not. It was not built out of the ground, unaffected by what was there before, and was not entirely fourteenth-century style. He had no doubt that where the screen is was originally the chancel, and that this and other features were the result of the site having been previously occupied by a church which was not entirely demolished until there was provision made for worship in the new building. One feature of the church was the extreme development of the

transept, the windows at each end of which were distinctly of an earlier period than the other windows. Having dwelt on various interesting features of the structure, Mr. Micklethwaite said it was attributed to a canon of York of the latter part of the fourteenth century. He thought that a mistake, and that the work was a little earlier than that, and that the erection was probably interfered with by "the black death" which desolated this country in 1349. Regarded architecturally, it was a great deal more of a Lincolnshire than a Yorkshire church, and a good deal of the detail was similar to that of Eckington Church.

#### REVIEWS.

THE ARCHITECTURAL DESIGNS OF WILLIAM BURGES, A.R.A.

Edited by R. P. PULLAN, F.R.I.B.A. Published at 15 Buckingham Street, Strand.

The time has hardly arrived for determining the position which the late William Burges is to hold in the history of English architecture. He was not fortunate in finding opportunities to manifest his capabilities. A church or two, a few houses, a small cathedral, and a castle tower are all that posterity will have as evidence of his powers. But, rightly studied, the buildings may suggest that William Burges was a great artist, who had discovered for himself those principles which are the basis of all that is good in architecture. His Gothic was unlike the Gothic of his successful contemporaries, inasmuch as it possessed more of the severity of ancient work in its contours, and more of the charm which sculpture and painting can impart to a building, when introduced with that insight and regulated by that judgment which is only to be found in men of genius. It is not, therefore, by designs or sketches that he should be judged but by completed buildings, of which unfortunately too few exist.

Mr. Pullan has reproduced illustrations of the buildings which have been constructed from Mr. Burges' designs, with some of the designs which were never carried out. Among the latter are the Memorial Church at Constantinople, the Law Courts, and the Edinburgh Cathedral, three splendid examples of architectural invention. The illustrations of actual buildings represent the Cork Cathedral, the tower at Cardiff, a house at Cardiff, the mansion of Knightshayes, Studley and Skelton churches, the Dover town hall, and his own house at Kensington. In all there are seventy-five plates; they vary in merit, and of some it must be said they are hardly worthy of the subjects. But architects will be able to make allowance for defects, and a student who has seen one of the buildings will be able to understand what blurred lines represent. The interest which the volume possesses as a memorial of William Burges is sufficient to compensate for many shortcomings.

SAW-MILLS: THEIR ARRANGEMENT AND MANAGEMENT. By M. POWIS BALE, M.Inst.M.E. (Crosby Lockwood & Co.)

Mr. Bale's book treats of an important subject, and in it is explained not only the process of cutting timber, but a good deal of information is given about the qualities of the timber generally used in this country. The arrangement of saw-mills is described, and the machinery and tools which are in use are analysed with the skill of a practical mechanic. The book will be useful to the managers of saw-mills and woodworks. It will also be invaluable to many an estate manager in England, Scotland, and the colonies.

Hawick Town Hall.

SIR,—In "Notes and Comments" in *The Architect* for Sept. 1, there is a reference to Mr. Honeyman's decision in the Hawick town hall, upon which I should like to make a few remarks.

Mr. Honeyman, it seems, has satisfied himself that nearly all the designs submitted in competition could not be built for the sum of money stated in the conditions. If that is so, permit me to state emphatically my conviction that he was right in rejecting those designs.

The position of professional adviser in the decision of a competition is one that I have not infrequently had the honour to fill, and I know that there is no small temptation to recommend for adoption the design which is really the best, though it may have thrown over some of the instructions. But a professional assessor must remember that he is a kind of trustee for his professional brethren, and further, that his duty to his employers is to keep them from doing an injustice quite as much as to help their judgment. The few guineas he gets from his clients do not constitute such a bond between him and them as that which exists between himself and the profession by which he lives, and to which he and all the other competitors are bound by most intimate ties. Perfect fair-

ness towards the competitors as well, let me add, as perfect fairness towards the employer, require that if the *assessor is really satisfied* that a design is beyond the limit of outlay, and if that limit was a definite and fixed and unchangeable condition of the competition, the design so exceeding should be set aside, and the profession has, in my humble opinion, reason to congratulate itself that Mr. Honeyman has acted as he has done.

Your obedient servant,

T. ROGER SMITH.

#### The Iron Curtain at the Royal Lyceum Theatre, Edinburgh.

SIR,—This curtain at the stage opening, the first of its kind in the United Kingdom, has been erected for me by Messrs. Clark, Bunnett & Co., of London. It measures 30 feet 6 inches wide by a depth of 28 feet 6 inches, and is constructed of two screens of wrought-iron plates one-eighth of an inch thick, with an air space between of 6 inches. The top portion of the curtain is framed and rivetted to double wrought-iron girders secured to the heads of hydraulic rams, which are fitted with their cylinders on each side of the proscenium opening.

The supply of water for working these rams is laid on from the town mains, and with an expenditure of only eighty-four gallons of water, the curtain, about six and a quarter tons, is raised or lowered in fifty seconds, the movement for working it being on the stage under the control of the prompter, thus forming, with the brick proscenium wall, a fire-resisting division entirely separating the stage from the auditorium.

The curtain at the opening of the theatre on Monday night last worked admirably, and in my opinion quite solves the question which has lately been so much discussed.

Your obedient servant,

CHARLES J. PHIPPS.

26 Mecklenburgh Square, W.C. :

September 12, 1883.

#### CHURCH BUILDING AND RESTORATION.

**Bromsgrove.**—The foundation-stone has been laid of a new church for the ecclesiastical parish of Finstall. Mr. J. Cotten, Birmingham, is the architect, and Messrs. Brazier & Weaver, Bromsgrove, are the builders of the new church, which will consist of nave, transept, south aisle, and basement of tower and spire, and will be capable of enlargement at any time by the addition of north transept aisles to the chancel and completion of tower and spire. There will be open sittings for 262 persons.

**Kirkcaldy.**—The old free church of Abbotsshall has been reconstructed from plans of Mr. John M'Lachlan, architect, Edinburgh. The frontage of the church is in the Gothic style. There is sitting accommodation for 834 persons, and in addition there are a vestry and class-room, which, by means of folding doors, form, along with the lobby, a convenient hall, capable of accommodating from 150 to 200 persons. The total cost of reconstruction and endowment will be over 5,000*l*.

**Northallerton.**—The nave and aisles of All Saints Church have been reopened after undergoing restoration. The church has been re-roofed and restored on the original lines; the walls inside have been stripped of whitewash, and the windows have been re-chiselled and filled with cathedral glass. The architect was Mr. Fowler, of Durham. The contractors were Mr. J. Dodgson, stonework; Mr. J. Wilson, woodwork; Mrs. Naylor & Son, whitesmith and gasfitting. The total cost of the restoration will be above 5,200*l*., towards which sum 4,000*l*. has been promised.

**Diddlebury.**—The parish church of Diddlebury, dedicated to St. Peter, has been reopened, after reseating and rearrangement of the interior. The old high pews have been converted into open seats; the floor under the seats is laid with wood blocks upon a bed of concrete, and the aisles with Godwin's tiles. Two arches have been thrown across the Cornewall Chapel for an organ-chamber and vestry. A new porch has also been erected. The work was under the superintendence of the diocesan architect, Mr. Thomas Nicholson. The contractors were Messrs. Jones & Sons, of Sedgely, near Dudley.

**Griston.**—The parish church of Griston has some time past needed repairs, as owing to dilapidations the roof was no longer weather-proof, and a settlement having taken place on the south side, the chancel arch was greatly out of the perpendicular. Mr. J. B. Pearce, F.R.I.B.A., of Norwich, after making a general survey, gave in his report, recommending an entirely new roof to the nave; that the chancel arch and part of the south wall be taken down and rebuilt; that the floor be raised and new tiling laid down; that the north porch be restored, and other exterior parts of the building be put in repair. The work has just been commenced. Unfortunately, after taking off the roof, the examination of the south wall showed that the foundations were in a most defective state. It has consequently been necessary to take down the whole of the south wall, and put in new foundations on which to rebuild it.

**Littleworth, Berks.**—A new vicarage-house, with offices and stabling, is now being erected in this village, from plans and specifications prepared by Mr. F. H. Barfield, F.S.I., architect and surveyor, of Faringdon, Berks, at a cost of about 1,300*l*. The walls are of local stone with red brick dressings, the covering of Broseley tiles, and the internal woodwork stained and varnished. The builder is Mr. George Cooper, of Aylesbury, Bucks.

#### SCHOOL BUILDINGS.

**Loughborough.**—The trustees of the Sunday schools in connection with the General Baptist Chapel, Baxter Gate, Loughborough, have decided to erect additional schools, as the present ones provide insufficient accommodation. The proposed buildings will be erected on a piece of land belonging to the trustees at the back of the chapel and close to the old schools. The new schools will accommodate about 250 children; the existing ones accommodate 500, so that when the works are completed there will be school accommodation for 750 scholars. The architect is Mr. Hampton, of Loughborough.

**Barnard Castle.**—At a meeting of the governors of the North-Eastern County School, held in the lecture room, Palace Green, Durham, Canon Dwaris presiding, Mr. Johnson, the architect, reported that eighty-three tenders for the erection of the schools and buildings at Barnard Castle had been received. Sixteen contractors went for the work in its entirety, and the remainder contracted for the various items of work. The governors, after discussion, agreed to accept the tender of Mr. Kyle, contractor, of Newcastle-on-Tyne and Barnard Castle, at the estimated amount of 15,448*l*., which was the lowest offer; the highest tender being 23,181*l*. This action is subject to the approval of the Charity Commissioners.

**Cardiff.**—A new Board school and teachers' house has been erected at Super Ely, near Cardiff, for the combined districts of St. George's and St. Bride's, and was opened on the 3rd inst. Messrs. Blessley & Aspinall, of Cardiff, have been the architects, and Mr. Miles Thomas, of Llantrissant, the builder.

#### ENGINEERING WORKS.

**Railway Extension.**—The increasing suburban traffic of the Great Eastern Railway Company has necessitated a large outlay in the construction of several additional lines of rails between Stratford and Liverpool Street, and these lines—four in number, four miles in length—have for some time past been in progress. The last contract in connection with these works was entered into about a fortnight ago, and the contractor has undertaken to have the whole of the works finished and ready for traffic by the beginning of the ensuing year. For the purposes of the traffic, it has been necessary to purchase a large amount of property on the north side of the main line, more especially in the neighbourhood of Bethnal-green, Bow, and Coborn Road; and at the last-named place a new and much enlarged station has been erected, the platforms of which are upwards of a thousand feet in length. In the rebuilding of this station it has been connected with Grove Road. Another new station has been built at Devonshire Street, and the authorities of the railway have expressed an opinion that the traffic between these two stations alone will in all probability pay for the expense of making the four additional lines from Stratford. In connection with the new lines the directors have also decided greatly to enlarge the Liverpool Street station, on the ground that, spacious as it is, its present area is not large enough for the traffic which daily comes into it at the present time. The cost of the enlargement of the station with the lines approaching it is estimated at 1,000,000*l*. The extension of the station has already been commenced by the erection of new offices and other buildings at the suburban portion.

**Waterloo Bridge.**—Considerable progress has been made towards strengthening the foundations of Waterloo Bridge. The structure was purchased for 475,000*l*. by the Metropolitan Board of Works, under the Toll Bridges Act of 1877, which required the above-named authority to abolish the tolls on the bridges over the Thames within the Metropolis, and thereafter to maintain and repair these communications. Waterloo Bridge was accordingly opened free to the public in 1878. About that time it was discovered that the buttresses had been injured and undermined by the "scour" or wash of the tide. In 1881 certain experimental works were authorised with a view to ascertain what would be the best means of deepening and securing the foundations of the bridge in the bed of the Thames. Investigation showed that this could be effected by placing continuous concrete blocks around the piers. The contractor, Mr. William Webster, commenced operations in January of last year, the amount of the contract being 62,705*l*. The repairs in connection with four of the piers are complete, viz., the second, third, fourth, and fifth from the Surrey side. Several pumping and other engines are in daily use,

steam-power being necessary to the expeditious construction of the coffer dams, and in keeping them dry during the process of putting down the concrete.

**Ports and Canals in France.**—A sum of thirty-two and a half millions of francs has been assigned for works in ports and harbours for next year, and a sum of twenty millions of francs to canals. Of the latter, among the most important are the Central Canal, which absorbs of the former amount one and a half millions; the Eastern Canal, which takes a little more; the canal to connect the Marne and the Rhine, which takes 890,000; while that connecting the Marne and the Saone takes 4,000,000; the canal between Mons and Paris, 800,000; and that between the Rhône and the Rhine, 330,000. The ports undergoing extensive and costly improvements are for the most part those of the north and west—namely, Dunkirk, Calais, Boulogne, Dieppe, Havre, Cherbourg, Nantes, La Rochelle, Bordeaux, &c.

## ART WORKMANSHIP.

**Stained Glass, London.**—Messrs. Charles Evans & Co. have executed some elaborate painted glass and pictorial tile work for the Albert Victor, Burnham Street, Canning Town. In the entrance lobby is a large tile picture 10 feet 5 inches by 10 feet 5 inches, the subject being *The Execution of Anne Boleyn*, selected as Anne Boleyn's castle is in the immediate neighbourhood. The dado is in raised tiles, with painted panels introduced. The walls of the alley way or entrance to the various bars are also panelled in ornamental tiling. In the front over the window are introduced stained-glass panels, in which are portraits of Henry VIII. and Anne Boleyn, surrounded by Renaissance ornament. With the exception of the plate-glass in front, the whole of the glass is either painted or lead lights. The same firm also supplied the ornamental tiles for alley way and the lead lights.

**Stained Glass, Chalfont.**—The large east window of St. Peter's Church, Chalfont, has just been filled with finely-painted stained glass, the gift of Mr. and Mrs. Hibbert, of Chalfont Park, to commemorate their golden wedding day, August 6, 1883. It is a five-light window of the Decorated period of architecture, and the three central openings are occupied with a representation of our Lord's Ascension, with groups of attending angels, and the two angels appearing to the disciples, who occupy the whole of the foreground of the picture. The left-hand opening has the Adoration of the Shepherds in a medallion-shaped panel, and the general groundwork is a rich grisaille pattern; the right-hand opening has a similar medallion, with the Charge to St. Peter. The large openings of the tracery are filled with angels on coloured grounds, and the smaller ones with sacred emblems. At the base of the window is inscribed "J. N. H. & J. A. H., 1883. Married 1833." The work, which is greatly admired, was executed by Messrs. Ward & Hughes, of Soho, London, who have previously executed windows in the same church for the Hibbert family.

## GENERAL.

**The Tinworth Exhibition** of Scenes from Bible History, at the Conduit Street Galleries, will remain open until the 22nd inst., when the Galleries will be required by the 19th Century Art Society, whose inaugural exhibition will open to the public on November 5.

**Mr. A. G. Grubb** has been appointed head master of the new Art School in Blackburn. There were a great many candidates for the appointment. Mr. Grubb was formerly a pupil of the Dundee school, and latterly was an assistant master in Manchester.

**The Loan Exhibition** of Old Masters at Edinburgh will close on the 29th inst.

**A Mural Monument**, of Gothic design, by Mr. J. Forsyth, has just been placed in the chancel of Swinstead Church, Lincolnshire, in memory of the Baroness Willoughby de Eresby.

**Mr. W. Henman, A.R.I.B.A.**, of Birmingham, on Wednesday read a paper at the conference of the Library Association at Liverpool, on the arrangements and fittings of free library buildings.

**Miss Lockwood**, second daughter of Mr. Lockwood, architect, Chester, was unfortunately drowned near Chester on Tuesday by the upsetting of a boat.

**The Manchester Technical School** is to be formally opened on the 27th inst., when Mr. Bernhard Samuelson, M.P., chairman of the Royal Commission on Technical Education, will deliver an address and distribute the prizes to the successful students of the past session.

**The Inverkeithing Town Council** have resolved to raise an action against the contractors for the Forth Bridge, to compel payment of customs dues on material landed at North Queensferry for the bridge works.

**Peterborough Cathedral.**—The demolition of the eastern piers of the lantern tower of the cathedral has revealed the cause of the failure of the supports. The foundations had been erected on a layer of sand, the solid rock being about two feet lower down. The foundation of the new lantern tower will be laid on the rock.

**A Town Hall** at Cellardyke, N.B., the gift to the town of Mr. S. Williamson, M.P., and the late Mr. David Fowler, both natives of the burgh, has just been completed at a cost of 3,500*l*. The formal opening is to take place on the 19th inst.

**The Leeds and Yorkshire Architectural Society** made an excursion to York on Saturday, when visits were paid to the St. Mary's Abbey, museum, and gardens, over which they were conducted by the Rev. Canon Raine, who described the architectural and historical characteristics of the once fine abbey church, &c. The Blind School, formerly a manor house, and for a brief period the royal residence of Henry VIII., was also visited.

**The Sanitary Institute** will hold its congress at Glasgow, commencing on the 25th inst. A meeting of the engineering and architectural section will take place on the 27th, and Dr. Richardson has promised an address for the occasion.

**Mr. Smith, of Aberdeen**, has prepared plans for an extension of the Aberdeen Royal Infirmary, providing from forty to fifty additional beds at an estimated cost of 7,500*l*.

**At a Recent Meeting** of the Skelton Local Board it was reported that 120 houses were uninhabited at Boosbeck, where the late subsidences have occurred.

**An Industrial and Art Exhibition** is to be held at Aberdeen in July next year.

**An Anvil Block** for the new works of the North-Eastern Marine Engineering Company, at Wallsend, has just been cast at the North-Eastern Foundry, South Shields. The weight is 36 tons, and it is said to be the largest casting ever made on Tyne-side. The melting of the metal occupied five hours, and it was poured into the mould by three ladles, one containing 15 tons, another 11 tons, and the third 10 tons. The casting was highly successful.

**The Brighton Town Council** have decided upon spending 10,000*l*. in erecting two concrete piers between East Street and Old Steine to supplement the sea defences already in existence at that point. The new piers will be protected by parapet walls and furnished with seats.

**A Stained Glass Window Society** is proposed to be formed for Hungerford parish church, on a plan similar to that which has been successful at Newbury. The aim of the society would be to enrol a sufficient number of members making the small annual payment of 5*s*. to allow of one window being added to the church every two years.

**Building By-Laws.**—William Hunt, of Old Windsor, having been summoned by the Windsor Rural Sanitary Authority for a breach of building by-laws, in having erected a pair of villas the party walls of which were of concrete, and were not of the prescribed thickness, has been fined 5*l*.

**The Finishing Stone** of the new town hall at Vienna, of which the architect is Herr Friedrich Schmidt, was laid on Wednesday. The building covers an area of 1,870 square metres, and has a frontage of 152 metres in the Ringstrasse.

**The Talargoch Lead Mine** was sold on Wednesday for 4,600*l*. It has always been considered the richest mine in Wales, and up to the present there seems to have been but little diminution in its yield. The mine, machinery, and plant were put up in one lot. There were ten miles of tramway connecting the mine with the London and North-Western Railway, and the machinery cost 50,000*l*.

**University College, Bristol.**—The success of the engineering department at this institution hitherto has been most encouraging, and special arrangements have lately been made for the systematic use of the engineering workshops. Not satisfied with past progress the Council have now provided several facilities for the study of architectural drawing, and special arrangements for the practical work of students in this department have been made with various engineers, surveyors, and architects in and near Bristol. The Medical School, possessing such splendid opportunities for clinical practice in the Royal Infirmary and General Hospital, is rapidly growing, and already the necessity for further accommodation has become apparent. Want of funds seems to be the only check to the fuller growth and increased prosperity of the college. We believe, however, that the citizens of Bristol will not allow an important institution which is doing so much good work to feel the need of liberal support.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, SEPTEMBER 15, 1883.

### TENDERS, ETC.

*As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—“Contract Supplement to THE ARCHITECT.”*

### TO AMERICAN SUBSCRIBERS.

*All subscriptions are payable one year in advance, and may commence at any date.*

*The cost of one year's subscription, mailed free, is 20s. sterling per annum, and Post Office Orders for that amount can be obtained at any Post Office in the United States.*

*Post Office Orders should be made payable at Lombard Street Post Office, London, but SHOULD BE ADDRESSED to GILBERT WOOD, 175 Strand, W.C., London, England.*

*In order to meet the difficulty which constantly arises from subscribers in the United States omitting to advise the Publishing Office at the time they remit a Post Office Order for the amount of their Subscriptions, and also as a reply to frequent inquiries as to the best means of obtaining THE ARCHITECT in America, the Publisher desires to offer the following suggestions:—*

*To prevent the possibility of delay, and to enable the Post Office Order to be the more readily traced in the event of its miscarriage in transit, it is advisable in all cases to notify per following mail, the number, date, and location of the order.*

### APPOINTMENTS VACANT.

STEYNING.—Sept. 18.—Applications are required by the Rural Sanitary Authority for the Appointment of a Surveyor. Salary 120l. per annum. Mr. E. Cripps, Clerk, Board Room, New Shoreham.
